3rd " - - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

An enlarged copy of this very complete pocket map of Cobalt will be obtainable after the first week of May. Orders will be received at the office of THE CANADIAN MINING JOURNAL. The map will also be offered for sale at all news stands. The geology of Cobalt Camp will be plainly and exactly indicated in colors. The very latest authoritative data have been used for this purpose. The map, although conveniently small, is comprehensive, clear, accurate and legible. It has been compiled at great expense and pains. It is, in fact, a remarkable piece of work, and THE CANADIAN MINING JOURNAL is glad of the opportunity of supplying the phenomenal demand which has arisen for a reliable map of Cobalt. The price is ONE DOLLAR.

SPECIAL ATTENTION PAID TO MINERS' REQUIREMENTS. **Correspondence Solicited**

STEEL WORKS AND HEAD OFFICE: = New Glasgow, Nova Scotia

PROVINCE OF QUEBEC

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved, whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such licenses the first right to purchase the mines. In the case of lands where the surface alone is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

Mining for superior metals on lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre;

Mining for inferior metals—$2.00 and $4.00 as above.

The words "superior metals" include all the minerals except products of small value and building material, such as peat, bog ores, ores, clay, chalk, sand, the gravels and stones, such as limestone, sandstone and granite used for buildings.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within the two years.

Mining licenses, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and may be marked out on the ground by posts. The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the Transcontinental Railway will run.

The government has made special arrangements with Mr. MILTON L. HERSEY, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines at Quebec, under the direction of the Superintendent of Mines, will give all the information asked for in connection with the mines of the Province of Quebec, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

HONORABLE JEAN PREVOST, Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec

The Book can be seen and obtained at the Offices of this paper.

Now Ready. **Published March 21.** **21st Year.**

Twenty-First Year. **Established in 1887**

The Mining Manual

For 1907

By WALTER R. SKINNER

Contains all the latest information up to within a few days of publication. The Standard Reference Work on Mines. 1,600 pages. In demy 8vo, cloth. Price 21/-, post free.

A Record of Information concerning Mining Companies (Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, and Exploration Concerns, etc.)

Arranged in Three Sections, **Australasian, African, Miscellaneous,** with Tables of Crushings at ends of Sections, followed by List of Mining **Directors and Secretaries,** their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected; also **Mining and Consulting Engineers and Mine Managers,** with their Company connections, and a **Dictionary of Mining Terms.**

THE MINING MANUAL FOR 1907 contains particulars of no less than 3,100 COMPANIES, arranged in three sections, 450 Companies being AUSTRALASIAN; 1,050 AFRICAN; and 1,600 MISCELLANEOUS (including Siberian, Mexican, Indian, Canadian, American, etc., and the Coal, Iron, and other mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; position at mine and ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts.

The Lists of Directors (over 7,000) and Secretaries (1,750) include their addresses and descriptions and names of the Companies with which each particular Director or Secretary is connected.

A complete Alphabetical Index, including many useful items of reference, occupies 40 pages.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Spring Catalogue will be ready for mailing by the first of March. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our Spring Catalogue for 1907 will be a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend.

Write for it now so as we can have your name on the list in time.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Underwood

If you use a typewriter at all, doubtless you use a visible writer—the other kind is obsolete. It may be that you have recently purchased some Underwood imitation for which strong claims were made; for instance, that the writing would remain in perfect and permanent alignment.

Everyone recognizes that the prime requisite of a typewriter is good work, and that good work necessitates accurate alignment. But no visible writer can possess this essential unless it has a guide at the printing point. The Underwood has the guide.

If you have a new Underwood-imitation, use it for six months. If it holds its alignment without the aid of the repair-man we will present you with the best typewriter made—an Underwood. Make the test; you stand to lose nothing, and—we feel quite safe.

Westinghouse
MOTOR-DRIVEN PUMPS

Westinghouse Induction Motor Driving Byron-Jackson 5-Stage Centrifugal Pump.

Where motor-driven pumps are used the heat always attending steam pipes and engine-driven pumps, the danger and expense of bursting or leaky pipes, the annoyance of steam traps, separators, etc., is eliminated. The space required for electric service wires is negligible compared with that required for piping, and in case of accident, any mechanical injury can be easily and quickly repaired.

3rd " - - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Dominion of Canada

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontorio in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

Fast Trains

To Quebec, the Laurentians, Eastern Townships, St. John, N. B., Halifax, Boston, Worcester, Springfield, Mass., New York, Portland, Me., and the principal Atlantic Seaside resorts, Kawartha Lakes, Toronto, Niagara Falls, Detroit, Chicago, Ottawa, the Temiskaming, Mississaga, French River, New Ontario, Sault St. Marie, St. Paul, Minneapolis, Winnipeg, and the Western Prairies, the Kootenay Mining regions, the Mountains of British Columbia—unrivalled for scenic grandeur—Vancouver and the Pacific Coast.

Fast Steamship Service

On the Upper Lakes, Owen Sound to Fort William, on the inland waters of British Columbia, on the Pacific Coast to China, Japan, Australia, via Honolulu and Suva, and to Skagway *en route* to the Yukon. The fastest and most luxuriously furnished steamers between Victoria, Vancouver, and Seattle, and on the Atlantic Ocean between Bristol, London, Liverpool, Montreal, and Quebec, in summer, and St. John in winter.

Double Daily Transcontinental Train Service

During summer months, and Daily Transcontinental Service during winter months.

CANADIAN MINING INSTITUTE

Incorporated by Act of Parliament, 1898.

AIMS AND OBJECTS.

(A) To promote the Arts and Sciences connected with the economical production of valuable minerals and metals, by means of meetings for the reading and discussion of technical papers, and the subsequent distribution of such information as may be gained through the medium of publications.

(B) The establishment of a central reference library and a headquarters for the purpose of this organization.

(C) To take concerted action upon such matters as affect the mining and metallurgical industries of the Dominion of Canada.

(D) To encourage and promote these industries by all lawful and honourable means.

MEMBERSHIP.

MEMBERS shall be persons engaged in the direction and operation of mines and metallurgical works, mining engineers, geologists, metallurgists, or chemists, and such other persons as the Council may see fit to elect.

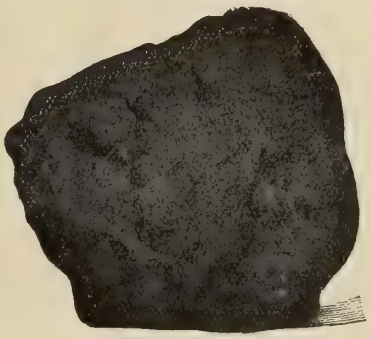
STUDENT MEMBERS shall include persons who are qualifying themselves for the profession of mining or metallurgical engineering, students in pure and applied science in any technical school in the Dominion, and such other persons, up to the age of 25 years, who shall be engaged as apprentices or assistants in mining, metallurgical or geological work, or who may desire to participate in the benefits of the meetings, library and publications of the Institute. Student members shall be eligible for election as Members after the age of 25 years.

SUBSCRIPTION.

Member's yearly subscription $10.00
Student Member's " 2.00

PUBLICATIONS.

Vol. I, 1898, 66 pp., out of print.
Vol. II, 1899, 285 pp., bound red cloth.
Vol. III, 1900, 270 pp., bound red cloth.
Vol. IV, 1901, 333 pp., bound.
Vol. V, 1902, 700 pp., bound.
Vol. VI, 1903, 520 pp., bound.
Vol. VII, 1904, 530 pp., bound.



Membership in the Canadian Mining Institute is open to everyone interested in promoting the profession and industry of mining without qualification or restriction.

Forms of application for membership, and copies of the Journal of the Institute, etc., may be obtained upon application to

Twenty-First Year. **Established in 1887**

The Mining Manual

For 1907

By WALTER R. SKINNER

A Record of Information concerning Mining Companies (Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, and Exploration Concerns, etc.)

Arranged in Three Sections, **Australasian, African, Miscellaneous,** with Tables of Crushings at ends of Sections, followed by List of Mining **Directors and Secretaries,** their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected; also **Mining and Consulting Engineers and Mine Managers,** with their Company connections, and a **Dictionary of Mining Terms.**

THE MINING MANUAL FOR 1907 contains particulars of no less than 3,100 COMPANIES, arranged in three sections, 450 Companies being AUSTRALASIAN; 1,050 AFRICAN; and 1,600 MISCELLANEOUS (including Siberian, Mexican, Indian, Canadian, American, etc., and the Coal, Iron, and other mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; position at mine and ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts.

The Lists of Directors (over 7,000) and Secretaries (1,750) include their addresses and descriptions and names of the Companies with which each particular Director or Secretary is connected.

A complete Alphabetical Index, including many useful items of reference, occupies 40 pages.

A PICTOU COPPER SMELTER

The Dominion Mining & Smelting Company, of Pictou, Nova Scotia, is urging upon the Government and people of that Province the necessity of securing lower rates of transportation. There are several promising deposits of copper in Pictou, Colchester and Cumberland Counties. There are also more than a few totally undeveloped properties being held by persons who cannot afford to open them under the conditions now prevailing. The Pictou smelter is favorably situated as regards water shipments. It overlooks the splendid harbor of Pictou. The present capacity of the smelter is seventy tons of ore per day, making a forty-five per cent. matte. The average charge of treatment at the smelter is about $6 per ton for ore laid down at their wharf, or in the ore sheds by rail f.o.b. The company also offers to treat ores on the custom basis.

As a commercial enterprise, the Pictou copper smelter is decidedly worthy of encouragement. Concessions in the direction of nominal freight rates and active help from the Government in the development of individual properties should be offered cheerfully. The Provincial Government owns several diamond drills and has a Department of Mines. In what better work could the Department be engaged than in giving active assistance to the owners of copper properties. All of our important metallurgical industries have either started from very small beginnings or in their inception have met with serious obstacles. The soundest success is that resulting from a small beginning. It is altogether likely that Nova Scotia, by judiciously encouraging the attempt of the Dominion Mining & Smelting Company, will be taking the first step in establishing a successful and important industry of this nature. There is no need of injecting a large amount of capital. The smelter is already in operation. To keep it profitably employed, everyone at all interested in the copper possibilities of the Province should energetically push forward prospecting and development. And it is necessary always to bear in mind that rich returns must not be expected. The enterprise must be conducted on careful, business-like lines. Even though some time should elapse before a small margin of profit is obtainable, it must also be remembered that whenever a measure of success justifies the erection of a larger and more modern plant, the cost of operations can be very largely reduced. We hope that the Province will see and grasp its opportunity. We hope also that the Town of Pictou will substantially encourage what seems to be a most deserving undertaking.

READJUSTMENT

On the first day of June the holders of stock in the Trethewey Silver-Cobalt Mine, Limited, were officially notified that the directors had decided not to pay the expected quarterly dividend of 4 per cent. An explanatory letter from the president, Col. Alex. M. Hay, and a copy of a report upon the condition of the mine by Consulting Engineer Frank C. Loring, were published in the daily papers. The immediate effect of the directors' decision was a pronounced drop in Trethewey stock.

The Trethewey has already paid two quarterly dividends of 4 per cent. It is producing about 50 tons of concentrating ore per day, from which, according to Mr. Loring's estimate, a net profit of $500 per day, or $150,000 per annum, may fairly be counted upon. To insure a supply of high grade ore, development work must at once be undertaken. Further, there is a large amount, 6,000 tons, of low grade ore on the dump, and an indefinite quantity of similar ore in the mine, which, upon concentration, will, Mr. Loring affirms, yield a net profit of at least $10 per ton. To realize upon this ore a concentrator must be erected.

The cash available for both development and construction purposes is $60,000, represented by ore in transit and ore in sight or ready to be shipped. All of this ore is, of course, high grade. Mr. Loring, after reporting upon the amount of work actually done in the way of mining, demonstrates clearly the necessity of passing the current quarterly dividend and devoting the available cash to the purposes outlined above.

We heartily endorse the action of the new Board of Directors. The president's letter clearly states the condition of the company's affairs. Mr. Loring's report is lucid and forceful. Like many other Cobalt enterprises, the Trethewey Mine is laboring under a colossal capitalization. It will be impossible for the majority of them to satisfy clamorous shareholders and at the same time give the mine fair play. But the common laws of honesty and decency demand that the shareholders should know the exact state of their company's affairs.

ENGLISH MINING LABOUR

Our English contemporary, *The Colliery Guardian,* in commenting upon the report of the Miners' Eight-Hour Day Committee, shows that although the average time worked, bank to bank, in British coal mines on a day of full work is now nine hours and three minutes; still owing to voluntary absenteeism, the men now work 13.36 per cent. less time than their theoretical full time; which loss, if evenly distributed, would reduce the average working day to seven and one-quarter hours. "The final conclusions of the committee as to the possible effects of an eight-hour day are sufficiently definite," *The Guardian* continues, "to have raised a feeling of distrust in the minds of some who have been most ardent in their zeal; it is being realized that grave issues are plainly indicated in the report, for which no one would willingly claim responsibility." It is worthy of note that the committee found that the general health and physique of coal miners compared not at all unfavorably with those of any other class of laborers.

ELECTRIC SMELTING AND BRITISH COLUMBIA

The Victoria Daily Colonist urges upon the Federal Government the propriety of sending Dr. Haanel to British Columbia to investigate the possibilities of the extensive iron deposits of the west coast and of the abundant water powers. It may be stated, with a large degree of moral certainty, that within the next few years the electric smelting of iron ores will have become a commercial process. In sending a Commission to Europe to investigate the experimental electric smelters there, and in appropriating money for subsequent experiments at Sault Ste. Marie, the Federal Government acted wisely and well. It has put its hand to the plow. The energy and money already spent will be relatively profitless unless more energy and more money are at once directed to further investigation. No more promising fields offer than certain sections of British Columbia. Changed conditions may throw new light upon the whole subject.

QUEBEC MINING LAW

The evidence in the libel suit of Asselin v. Prevost, which has been in progress recently in Quebec, has very clearly demonstrated the weak points in the mining laws of the Province. Under the provisions of the law as it now stands, speculators are enabled to secure and tie up large areas of mineral territory in promising districts by the payment merely of the fees demanded for prospecting permits. Directly mineral is discovered in a new area these speculators rush to grab all the territory within miles of it, and, in consequence, the man with the pick, the legitimate prospector, who makes a business of searching for property worth developing, has in the face of such circumstances no chance whatever. Moreover, under this system undue temptation is put in the way of the Government employes in the Provincial Mines Department to show favoritism in mining permits.

One of the witnesses at the trial in question swore that he had been a victim of a clerk's mistake, although he did not say it was intentional, whereby land for which he had been the first to apply was granted to a later applicant. It is, however, an ill-wind that blows nobody good, and at least many of those who have taken advantage of the Act to secure large areas at a nominal figure have managed to make a very handsome thing of it, one gentleman admitting that he had "cleaned up" the snug little of sum of between "a hundred thousand and a million dollars" from the sale of his prospecting permits in one district alone in the last two years.

EDITORIAL NOTES

From figures compiled by the *Labor Gazette*, it has been shown that, with the exception of the professional classes, the wage-earners engaged in the mining industry in Canada receive higher average annual wages than any other class of workers. While the professional classes average $678.88, the miner averages $513.77.

Mr. A. P. Low is the new Deputy Director of the Department of Mines. Dr. Haanel is to retain his present position. Mr. John Marshall, formerly accountant of the Geological Survey, is to be account of the new department. The Deputy Director will still perform the functions pertaining to the office of Director of the Geological Survey.

A startling statement is made by a writer in a recent number of the *United Mine Workers' Journal*. He claims that, during the labor trouble in Colorado, a well-known detective bureau employed men to work their way into the labor organizations for the purpose of securing early information as to the plans of the unions. These spies, it is alleged, sent to headquarters exhaustive reports of the proceedings of the miners' meetings. In this way a great many of the strikers' plans were rendered abortive. It is sincerely to be hoped that employers of labor in Canada will never stoop to such degrading measures.

The Klondike River was free of ice early in May. Placer working and dredging have already been commenced in the Yukon. While this northern region has been favored with a remarkably early disappearance of ice and snow, Middle and Eastern Canada have suffered from an abnormally late and malignant spring. Adverse weather conditions have prevented and retarded prospecting and general development. On the Nova Scotia coast, late in May, pack ice from the north blocked North Sydney Harbor and caused a short though very vexatious delay in coal shipments. Already the fuel shipments from Nova Scotia to St. Lawrence ports are far below the figure attained at corresponding dates of last summer.

In this number of THE CANADIAN MINING JOURNAL will be found an article on the Boston-Richardson Gold Mine. This Nova Scotian mine is working profitably a very low grade gold ore. It affords a very striking example of the benefits of the application of common sense and modern methods of mining and ore reduction and concentration. In these respects it stands out prominently against the dark background of failure, incompetency, mismanagement and ill-fortune that so characterizes the gold industry in Nova Scotia. It is encouraging, however, to notice that in several districts the same methods are producing the same cheering results. Nova Scotia's gold mines need and must have competent, careful management.

Authorities appear to agree in the view that not only will the present high price of copper be maintained, but that there is every likelihood of a marked advance within the next six months. This belief is based on several apparently sound reasons, of which may be mentioned the recent falling off in output, the restlessness of labor in many of the large copper mining centres of the United States, Canada and Mexico; the relatively limited available supply of the metal for immediate delivery, and the increased demand from Europe. The *London Financial News*, reviewing the copper situation, points out that whereas sixteen years ago the world's visible supply represented 25 per cent. of the yearly production, at the end of 1906 it was only 2 1-2 per cent.; and, allowing for the natural increase in the world's output for this year, in the month of April, barely 2 per cent., or just sufficient for a week's supply.

The Dominion Government has announced that it will shortly publish a report upon the mining industries of Canada. This is most commendable. If suitable appropriations are made and capable men engaged, the report should be a very valuable work of reference. The Dominion Geological Survey and the Mines Department have done a great deal towards diffusing information about Canada's mineral wealth. So also have the Mines Departments of Ontario, British Columbia, Nova Scotia and Quebec. But although a large amount of valuable information has been published from time to time, it is so scattered as to be of very little practical use. It is also true that only the fringe of Canada's possibilities has been touched.

To collect, redact and condense all available published information touching the mining industry of Canada would be a heavy task in itself. If it is intended to bring this up to date, and to do more than merely indicate the country's undeveloped resources, then there will be required the continuous services of a large staff of experienced specialists, over a long period of time.

We are informed by Mr. H. Carnegie Williams that his company, the Copper Mining & Smelting Company of Ontario, has ordered and is soon to install one trial unit of the Elmore Vacuum process ore concentrator at their Bruce Mines plant. One unit has a capacity of 40 tons per day. As the company's mill requires 400 tons per day, a considerable installation will be required if the trial unit proves satisfactory. The company's consulting engineers, Messrs. Pellew-Harvey & Fell, of London, England, inspected Elmore installations in Cornwall, and reported very favorably upon them. Waste dumps, containing from 0.65 to 0.76 per cent. of copper, associated with other minerals, are being treated. An actual recovery of 90 per cent. of this copper is reported. As the Bruce Mines ore is a clean chalcopyrite, and as the old waste heaps, amounting to 120,000 tons, carry 1.15 per cent. copper, the Elmore

process should be most readily applicable. Indeed, experiments carried on by the inventors on samples of Bruce Mines ores have shown a saving of 93.5 per cent. of the values. One need not be a confirmed optimist to hope for great things from this new process.

An article entitled "Some Facts About Cobalt" appears in the issue of *Canada* for May 18th. While the writer of the article in question is perfectly justified in warning the British public against investment in some of the prospectusless Cobalt undertakings which are now being floated in London, he goes to extremes in stating that Cobalt's record for the last twelve months is unsatisfactory. The writer also attacks a recent Canadian promotion and stigmatizes as an extravagant falsehood, "sufficient to destroy all confidence in the company or its directors," a statement of one of the promoters that in one of the company's mines ore to the value of three millions sterling had been blocked out above the one hundred foot level. As many of our readers know, this particular statement is strictly within bounds and is vouched for by no less an authority than Professor Miller. As to the Cobalt district, though doubtless many worthless properties have been foisted on the public, there is probably no mineralized area in the world, of like extent, comparable in point of richness of silver values; nor are we aware of any silver camp which in so short a time has equalled Cobalt's record in the matter of output or dividends. In short, there is no mining district in Canada where it should be a matter of so little concern whether British capital is invested there or not.

The reports of the Mines Inspectors for 1906 for the Newcastle (England) District shows that approximately 28,000,000 tons of coal were raised during that year. Beside 347,162 tons of fire-clay, small quantities of ironstone, brick shale and ganister were mined. For five successive years a record output of coal has been raised in the district. Among permitted explosives used in the collieries, Bobbinite stands at the head, 281,808 pounds of this explosive having been used. Saxonite ranks next, with 206,567 pounds In other explosives, gunpowder has 3,256,687 pounds to its credit. The disc class of coal-cutting machine has precedence in this district over others, and compressed air is used as motive power more extensively than is electricity.

In the west of Scotland district, 18,897,278 tons of coal were raised, fire-clay 492,350, and ironstone 727,158. It is true, also, in this district, that the disc coal-cutting machine is by far the most popular, and compressed air is the favored motive power. After gunpowder, gelignite is more extensively used than any other explosive.

Yorkshire and Lincolnshire are credited with 32,547,905 tons of coal, all of which comes from Yorkshire. The same remarks about the disc coal-cutter and motive power apply again. A great variety of explosives are used in this district. Bobbinite comes first, with gunpowder a close second. The Marsant safety lamps, fitted with lead rivet locks and burning colza or colza mixed with paraffine, are most largely used.

MICA IN ONTARIO

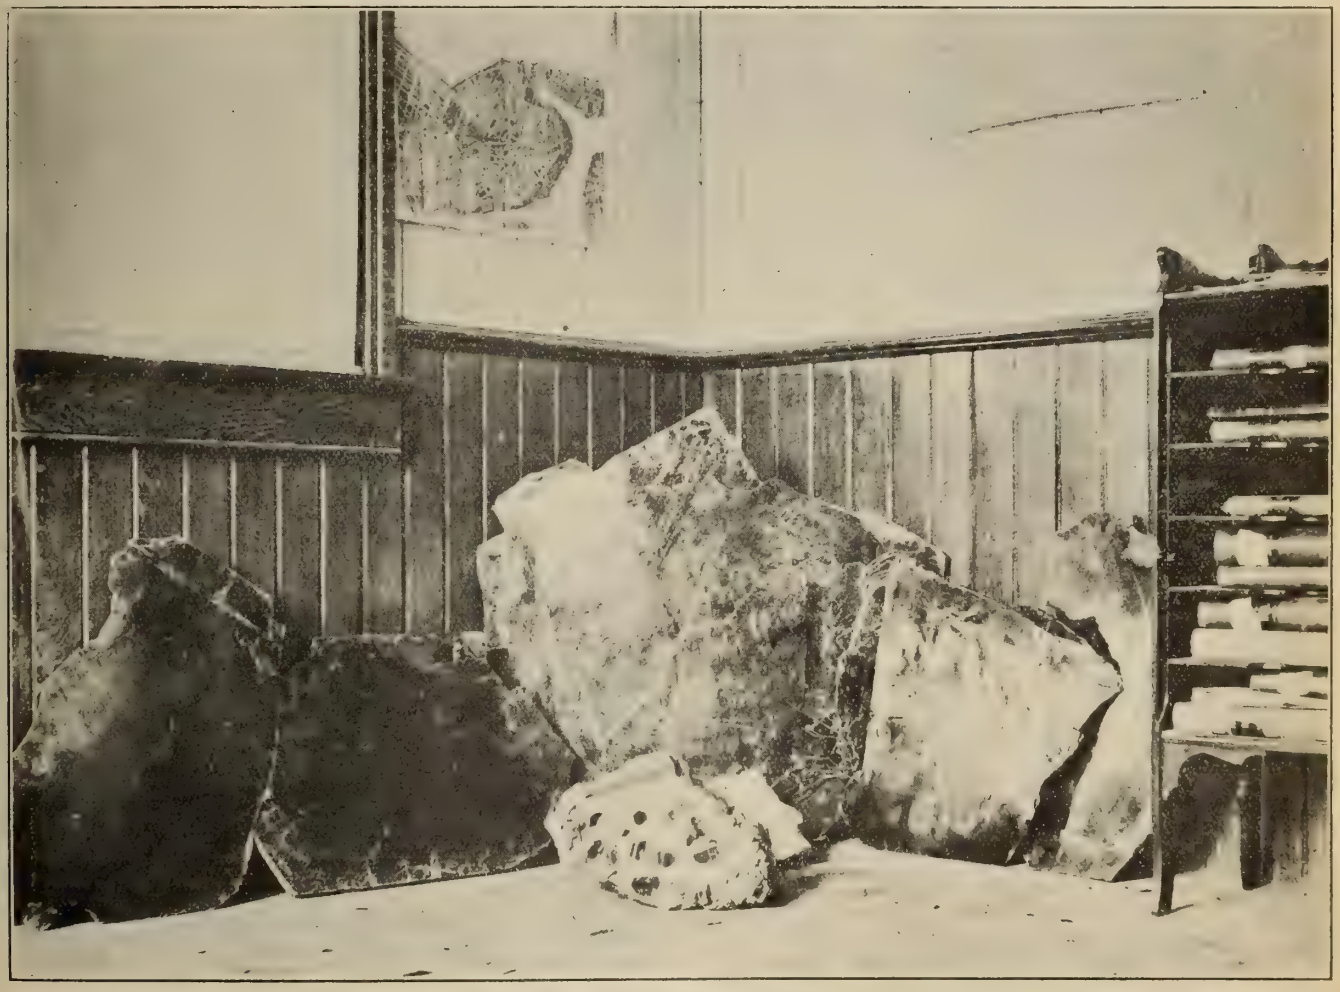
By E. T. CORKILL

The mining of mica in Ontario dates back to about the year 1860, when a quantity of large and carefully selected sheets from lot 17, in the ninth range of the Township of North Burgess was sold in Paris for the use of the French navy, at a price of $2 a pound. Some of this mica was in sheets twenty inches square, or larger. At this time, 1860, and for the following thirty years, mica was used chiefly for stove fronts, lanterns, lamp chimneys and also instead of glass in the windows of ships of war. to save breakage from concussion. The production of mica from the sixties until the beginning of the nineties was chiefly as a by-product of apatite. These two minerals are very intimately associated, and during that time there was a large trade in apatite, with a rather small demand for mica, and then only for the large sizes. As a result the deposits were all worked for apatite, and the mica was simply a by-product. Between 1890 and 1895 mica, particularly phlogopite, or amber mica, was first used in the electrical industry, which gave an impetus to the industry in Ontario. Prior to the time the small sizes of mica had not been marketable, thus this new industry created a market for a size of the material of which a large quantity had already been mined and thrown away as useless. This has, therefore, been re-sorted, and the small sizes previously thrown away saved and marketed. The sizes of amber mica now asked for by the buyers, and the approximate price which the cleaned mica will bring, are the following:—

1 in. x 2 in.....	5-6 cents	per pound.
1 in. x 2 in.....	10	"
1 in. x 3 in.....	20	"
2 in. x 3 in	45	"
2 in. x 4 in.....	65	"
3 in. x 5 in.....	75	"
4 in. x 6 in.....100		"

Mica, on account of its peculiar characteristics, has a wide field of usefulness. Its elasticity, non-conductivity and infusibility make it a mineral particularly adaptable for use in insulating armature slots, armature magnets, commutator cores, transformers, etc. A great many artificial substitutes have been tried, but none have been found as yet that have been satisfactory. In Ontario all the mica mined at the present time is phlogopite, or the amber mica of commerce. This mica is used almost exclusively in the electrical industry. A small quantity only is used in manufacturing lamp chimneys, for lights for windows, in stoves and peep holes in furnaces, which enables the operator to watch the process without suffering from the intense heat. Micanite has become an important factor in the

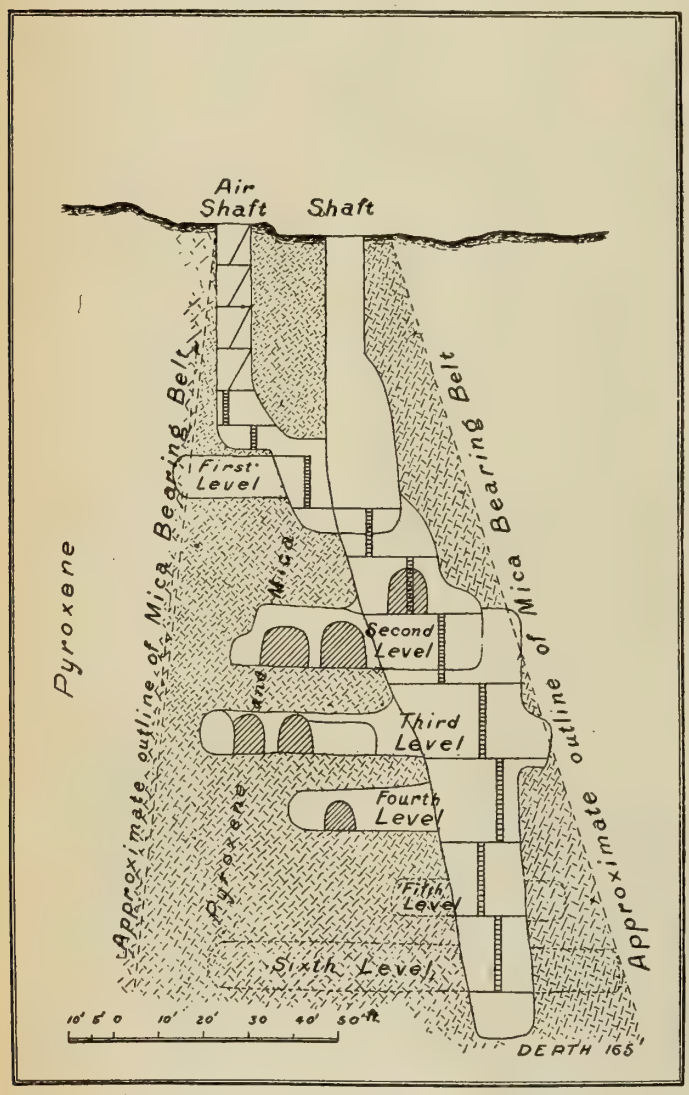
utilization of the small sizes of mica as 1 x 1, 1 x 2, 1 x 3 and 2 x 3, by being cemented together by the aid of a cement as shellac. After the mica has been built up into these plates by means of the shellac, it is put into steam presses and baked and steamed at the same time.



CRYSTAL OF MICA

All the properties of the shellac, excepting the cementing quality, are supposed to be eliminated in this process, so that the insulating qualities of the plates are not reduced or lowered. After being baked and pressed, the plates are milled for the purpose of making them smooth and even. They are then sawn into segments. If it is required to make rings, etc., out of this plate, they are made by steaming the micanite to the shape required. Another use for mica that is coming more into prominence is the use of the scrap mica for boiler and pipe covering. This has proved very efficient whenever used. The scrap mica is also used when ground and mixed with oil as a lubricant.

Mica, as referred to above, was first mined in the Township of North Burgess, County of Lanark, in the early sixties. Since that time, this township has proved to be one of the most productive sections of Ontario. The other most productive mica area in Ontario is the Township of Loughboro'. These two townships of North Burgess and Loughboro' have produced more than fifty per cent. of the total production of Ontario.



Phlogopite, or amber mica, occurs in the granitic and gneissic rocks of the Laurentian. The southwestern end of the amber mica-producing section is in Loughboro' Township, Frontenac County. From here, south and west, the Laurentian is overlaid by the limestone of Silurian age. On lot 11, concession 7, Loughboro' Township, is situated the Lacey Mine, which has proved a very steady producer and has probably produced more mica than any other property in the Province.

The first work was done on what has since been known as the Lacey Mine in 1884, when a shaft was sunk on the vein. This was owned at that time by Messrs. Smith and Lacey, who took out a large tonnage of an exceedingly good grade of mica. The pit was sunk to a depth of about 130 feet, and vein stoped out for a distance

SPECIMENS OF ONTARIO MICA

of about 130 feet along it, with an average width of vein of from 10 to 15 feet. This pit was abandoned in the early nineties, and the mineral right of the lot sold to the General Electric Company of Schenectady, N.Y. In 1899 a new discovery of mica was made about 200 feet southeast of the old workings. This has been worked continuously since that time and has been a large producer. It has been worked to a depth of 185 feet and longitudinally over 200 feet. The vein in some places is 20 to 25 feet in width. On the first level at a depth of 60 feet the drift has been run southeast on the vein a distance of 175 feet. On the fourth level at a depth of 117 feet two drifts run southeast, the easterly drift being 150 feet and the westerly drift 135 feet in length. Northwest of the shaft the mica has been stoped

Vertical Section of Lacey Mica Mine, Sydenham, Ont.

out for a distance of about 50 feet. On the second level a cross-cut has been driven a distance of 55 feet to cut a parallel ore body, which thus lies between the old and new workings. This body is about 75 feet in length, 60 feet in depth, and has an average width of about 8 feet.

The mica, which is a phlogopite, occurs in a vein matrix of calcite and pyroxene. The phlogopite is well crystallized, sometimes occurring in crystals 6 feet in diameter, and sometimes 4 to 5 feet in thickness. The wall matter surrounding the vein is essentially a mica pyroxene schist. The bedding of this rock cuts the vein at right angles. This is very marked on the fifth level of the mine, where the bedding occurs at an angle of about 20 degrees from the vertical and at right angles to the vein.

Lacey Mica Mine, Sydenham, Ont. Operated by the General Electric Co.

The mine is well equipped with two 60 horse-power return tubular boilers, six drill compressor and hoist.

About three miles from the Town of Elgin, on lot 7, in the 6th concession of Bastard Township, County of Leeds, the Brockville Mining Company are working a property which is of interest in that it occurs some distance from any other workable deposit, and also the mode of occurrence of the mica is different. The mica is a very dark amber, almost verging into a biotite. The vein is about 4 feet in width and dips at 30 degrees to the horizontal. The vein material is composed, as usual, of calcite and pyroxene, with the mica crystals, being crystallized throughout. The main difference between it and the larger mica deposits in the Province is that there is no (what the miners term) mica rock lying along each side of the vein. This mica rock is generally a mica pyroxene schist, which occurs between the vein and the granite or granite gneiss. At this particular deposit the vein cuts the country rock, which is a very dark hornblende granite, thus leaving the mica crystals lying right against the granite. On account of the hardness of the rock, the mica has been crushed considerably

Mica Mine near Elgin. Owned by the Brockville Mining Co.

on crystallization and the vein is more liable to be in the form of lenses.

The Hanlan Mine, situated on lot 11, in the 6th concession of North Burgess, is probably the best example of a true fissure vein of any amber mica mine in the Province. Here the vein has been mined for a depth of 120 feet, and a length of about 200 feet, without a break in it. The vein is quite uniform in width, averaging about 6 to 8 feet, while in some places it widens out to about 15 feet. The vein matrix, as is usual, consists of calcite and pyroxene, with occasional pockets of apatite. The mica in parts is well crystallized, while in adjacent parts it is quite badly crushed. The wall rock is a mica pyroxene schist, but not enough work has been done cross-cutting this to show whether there is any distinct bedding. In other respects it is quite similar to the corresponding mica pyroxene schist at the Lacey Mine. This vein strikes east and west, cutting the granite gneiss of Laurentian age, and dips to the south at an angle of about 75 degrees to the horizontal.

As an example of a deposit where the apatite predominates in the vein matrix, I shall briefly describe the mine known as the Smith Mine, owned by the Dominion Development & Improvement Company. This mine is situated on the east half of lot 13, in the 5th concession of North Burgess, and was originally opened up as a producer of apatite. After a pit had been sunk about 25 feet on the vein, mica crystals were found through the apatite. The apatite is soft and granular, thus giving the mica a favorable matrix in which to crystallize out freely. The vein in some places is 10 feet wide, consisting of apatite, calcite and mica. The vein dips at an angle of 50 degrees to the horizontal. On each side of the vein we find a mica pyroxene schist some few feet in thickness, which in turn cuts through the granite gneiss. This belt of mica pyroxene schist can be traced for some distance along the surface, where at different places a little mica has been taken out. The association of the pyroxene rock with the mica veins is very marked over the whole mica area. In fact, it is very rare to find a large, healthy deposit unless it is enclosed by this rock.

FINISHING HOUSE—LACEY MINE, SYDENHAM.
Operated by the General Electric Company.

At the present time the preparation of the mica for the trade has created quite an industry in Eastern Ontario, especially in Ottawa, which is quite favorably situated as the centre of the mica-producing sections of Ontario and Quebec. In Ottawa two of the large consumers, The Laurentide Mica Company (Westinghouse) and The General Electric Company, have built factories in which they employ from 500 to 600 girls in the preparation of the mica for the market. The preparation consists of cleaning or breaking off all the ragged or broken edges of the run of mine crystals, and splitting it down to about one-eighth of an inch in thickness, and grading it to the different marketable sizes.

This is then knife-trimmed and taken to the tables for thin splitting. The chief and essential characteristic of mica is its highly perfect basal cleavage, permitting the mineral to be split exceedingly thin. This characteristic is made use of in thin splitting. The purpose of the mica being thin split is to enable it to be built up into what was described above as micanite. Most of the mica mined in Ontario is shipped to the United States.

Canada has for some years been the second largest producer of mica in the world, India producing the greatest tonnage. The India mica is all white mica, or Muscovite, of which quality of mica Ontario produces none, although we have some pegmatite veins containing white mica, which have been but little explored.

Canada can thus be said to rank first in the production of phlogopite.

THE MARBLE BAY COPPER DEPOSIT

BY O. E. LEROY.

(By permission of the Director, Geological Survey of Canada. Toronto meeting, 1907.)

INTRODUCTION.

During a reconnaissance survey of part of the southern coast of British Columbia, in the summer of 1906, the writer had an opportunity of examining briefly the ore deposits occurring on Texada Island. One type of deposit is of particular interest, both on account of its being in a contact metamorphic zone and of its economic importance in containing valuable ores of copper. These deposits have previously been described in the reports of the Provincial Mineralogist, and in several papers by Mr. W. M. Brewer. In his later papers Mr. Brewer has drawn attention to certain deposits occurring on Gribbel Island, and in the White Horse District, Yukon Territory*, and shows that in mode of occurrence they are very similar to those on Texada Island.

The object of this paper in describing an example of this type is to again emphasize the economic importance of these deposits lying in widely separated areas, and to show that they are worthy of the careful consideration of those interested in mining.

GEOGRAPHICAL POSITION.

Texada Island, named by Elsa in 1791, lies in the Strait of Georgia, its south-east end being about 80 miles north of Victoria, and 47 miles from Vancouver. (See Fig. 1, Inset Map.) The town of Van Anda, where the chief mines are situated, is about 75 miles from Vancouver, and is a port of call of the Union Steam Ship Company. The island has a length of 30 miles with a maximum width of 6½ miles. High and mountainous throughout, especially in the eastern half, where Mount Shepherd attains a height of 2,900 feet, it presents to the observer when viewed at a distance the appearance of part of a submerged mountain chain. The shores are very rugged, with bold cliffs fringed in part with narrow boulder beaches. Sand and gravel beaches are few and there are only three harbors, Marble, Gillies and Blubber Bays, the two latter being somewhat exposed in certain winds.

GENERAL GEOLOGY.

The island is underlain by the Vancouver series of Dawson, part of which has been referred to the Triassic. There seems, however, to be an entire absence of fossils in the associated limestones, and part, if not all, of the series may belong to the Paleozoic era. The series admits of two divisions. The lower is composed of chlorite and hornblende schists, tuffs, amygdaloidal lavas, porphyrites and agglomerates which show over small areas obscure bedding. The upper division consists of limestone, which varies from a massive thick bedded unaltered rock to a fine grained pure white marble.

Subsequent to the deposition of the limestone there was considerable volcanic activity, and the whole of the Vancouver series was much disturbed by intrusions of diorite, gabbro, hornblende and augite porphyrites and diabases. The relations of these rocks with the limestones are well seen where they have intruded as dykes, sills and irregular masses faulting, and marbelizing the latter.

These igneous rocks, both older and younger than the limestones, have been much altered, and a large proportion of their present mineral content consists of secondary epidote, magnetite, chlorite, pyrite and calcite. They are widely developed and underlie the greater part of the island. The limestone, with the exception of a few small outliers, appears only at the north-west end, where the exposure has a length of 7½ miles, with a maximum width of two. In upper Jurassic times extensions of the great Coast Range batholith, consisting of granites and syenites, penetrated this older series and had a profound effect on them, producing schistose structure and shear zones in many of the igneous rocks, and converting the limestone to various crystalline types along with widespread faulting as the discordant strikes and dips now show.

The coast batholith was followed by a great series of basic dykes, principally diabases, and all the older rocks have been cut by them.

The Cretaceous has a limited exposure at Gillies Bay, consisting of feldspathic sandstones with calcite cement. The beds are probably basal, and are but slightly disturbed with low dips to seaward.

During the Glacial Period the island was eroded by the Strait of Georgia Glacier. A thin mantle of drift covers certain areas composed of sandy boulder clay, the boulders being principally varieties of granite from the main coast.

In the general depression which followed the island was much reduced in size, being some 400 feet lower with respect to sea-level than at present.

ECONOMIC GEOLOGY.

In the early nineties attention was first called to the occurrence of free gold in quartz veins, and later, deposits of rich copper sulphides were found in the limestone. These latter were not considered of any great importance at the time, but subsequent development has proved the contrary. Both divisions of the Vancouver series contain valuable ore bodies, which are found in the eruptive rocks, at their contact with the limestone, and in the limestone.

In the eruptive rocks, the ores occur in shear and fracture zones with quartz and country rock gangue.

Much movement is shown by the slickensided walls, and later cross fractures are filled with calcite. The ores are galena, zinc blende, copper and iron pyrites carrying as a rule low values in gold and silver. The ore is also very pockety, and solid ore alternates with barren zones. The width of the veins varies from 2 to 4 feet, and one mine only, the Surprise, has been proved to a depth of 360 feet. Other veins contain pyrite chiefly and have been noted for the rich showings of free gold in quartz. These, unfortunately, were only surface enrichments and had no depth, the pyrite immediately below being practically barren.

Contact deposits between the various igneous rocks and the limestone, include the large and important bodies of magnetite situated on the south side of the island and owned by the Puget Sound Iron Company. On this property there is also a series of copper deposits—chalcopyrite and carbonates—along the contact of the limestone with the altered porphyrites or the magnetite. The ore occurs in rudely lenticular bodies lying at various angles from vertical to horizontal, the limestone being almost invariably the hanging wall or roof.

The important deposits of bornite and chalcopyrite, to which particular reference will be made, are found wholly in the limestone. At present two mines are being worked—the Marble Bay and Cornell. The Copper Queen, which was the pioneer mine of the district, is lying idle. (Fig. 1).

THE MARBLE BAY MINE.

In 1897, an insignificant outcrop of copper and iron pyrites with some bornite was found a quarter of a mile east of Sturt Bay, on a Crown-granted lot, owned by Messrs. Christie and Palmer, of Toronto. A shaft was sunk on the ore and drifts run, but it was not until the 260-foot level was reached that the ore body assumed a definite character.

In 1902 the property was purchased by the Tacoma Steel Company for $150,000, and it was extremely gratifying to the company to have been able to pay the whole of the purchase price in three years out of the profits earned by the mine. The mine is now 760 feet deep and 715 feet below high tide. The ore body from the 260-foot level to the present workings has varied in length from 75 to 115 feet, and in width from a few inches to 45 feet. On the first floor of the 760 level, it is 87 feet long with a maximum width of 32 feet.

From the 140 to the 560 level the ore body pitched north at a high angle, but from there to the 760 it is practically vertical.

From the data collected this deposit may be described as an ore chute, occurring in a zone of brecciation in the crystalline limestone, this zone being approximately parallel to the strike. Divided into subordinate chutes above the 360 level, it has, below that, been continuous. The borders are broadly irregular, and small stringers are given off which run a few inches into the country rock. In the upper levels the walls were brecciated and weak, but in the lower they are firm, and very little work is necessary in the way of lagging. The ore is bornite with subordinate chalcopyrite, and a little pyrite, pyrrhotite and molybdenite. These occur in a gangue made up largely of pale green pyroxene—"green-felsite,"—and reddish brown garnet—"bull-felsite."—with calcite. The ore is either finely disseminated through the pyroxene, or occurs in large rather pure masses between the pyroxene and the limestone. Very little is found in the garnet. A considerable proportion of the pyroxene gangue is partially altered, and disintegrates rapidly on exposure to the air. There are also large areas of the pyroxene which are practically barren. A microscopic examination of a few prepared sections of the gangue shows that the pyroxene (variety omphacite) occurs in mosaics of clear individuals with turbid borders. The garnet, which shows zonary structure, and optical anomalies, is traversed by numerous cracks which are filled with turbid material, in part calcite. Towards the calcite, the garnet has a tendency to develop crystal outline. Bornite and chalcopyrite occur in small grains, solitary, or connected in groups by narrow stringers between the pyroxene individuals, inter-grown with them, or along cracks in them and the garnet. Calcite with the larger grains of the sulphides, well formed garnets-andradite—and vesuvianite, were the last to crystallize out, and filled all the interstitial spaces.

Subsequent to the formation of the ore body, it was cut by one of the later dykes of basic porphyrite. Between the seventh and eighth levels it varied in width from 4 to 6 feet, with ore on both sides. This dyke dipped to the south, and in its downward extension became much reduced in size. On the 760 level it is only 7 inches wide, and crosses the drift some distance south of the ore body. It is highly altered with a development of numerous fissures now filled with epidote, and pyrite. This intrusion caused considerable movement in parts of the ore body, and many small fissures were formed and subsequently filled with chlorite, pyrite and calcite. Some beautiful examples of slickensided surfaces are seen, especially where molybdenite occurs. The pyroxene and garnet have both been fractured, and under microscopic examination the former showed strain shadows, incipient and complete granulation, with considerable alteration. Bornite has been re-deposited along these lines of fracture, between individual grains, and along cleavage planes. It occurs in solitary and connected grains and parallel bands. Calcite of the first generation shows strain shadows, and the last phase in the formation of the deposit was the filling up of the small interstitial spaces with calcite. The order of crystallization was pyroxene and garnet, simultaneously, along with the greater part of the bornite, then the remainder of the bornite in larger masses associated with well-formed garnets, vesuvianite and calcite.

ORIGIN.

This deposit is closely connected with the intrusion of the coast granite, and is clearly of pneumatolytic origin, being an example of the Kristania type.

It is well known that molten magmas give off enormous quantities of aqueous vapors which in this case would have a profound effect on the limestone through which they would pass along zones of brecciation or bedding planes. The limestone has here been replaced by silicates rich in lime, and by sulphide ores with the consequent liberation of carbonic acid gas. With the exception of the lime and a small amount of magnesia, all the other constituents are foreign to the limestone, and must have been brought up from below with the aqueous vapors.

An approximate analysis of the pyroxene gangue resulted as follows: SiO_2 55.25, Fe_2O_3 and Al_2O_3 6.50, CaO 25.00, MgO 14.50.

Garnet (andradite) averages about 31%, and vesuvianite about 35% of lime oxide.

The deposition of ore and gangue went on simultaneously with the cooling of the granite magma, and the ore body was formed before the intrusion of the aplite dykes. These dykes have not been found as yet in the

Marble Bay mine, but they have been noted in two instances in the neighboring deposits.

ORE VALUES.

The ore throughout is essentially high grade and carries good values in gold and silver. The ore, which is finely disseminated through the pyroxene gangue, carries much higher values in gold and silver than the purer and more massive bornite and chalcopyrite. It has also been found that the percentage of copper has steadily increased with depth.

As it is necessary to mine considerable barren gangue which is intimately mixed with the productive, the ore is hand sorted before shipping and graded into coarse and fines. The waste, on account of its fluxing properties, is shipped in large part and sold to the smelter. At present the total production is sent to the Tacoma smelter for treatment.

In order to ascertain the average value of the ore, the smelter returns for the year beginning in June, 1905, and ending June, 1906, were examined with the following result:

Grade.	Gold oz. per ton.	Silver oz. per ton.	Copper per ct. (dry)	Net value per ton.
Coarse	0.498	4.138	6.765	$28.77
Fines	0.1678	1.569	1.602	6 88
Waste	Tr.–.08	0 15–0.9	0.22–0.8	0.50
Coarse	1.006	5.73	11.25	

The last entry of coarse grade refers to a shipment of 116 tons made in July, 1906.

About 13,000 tons are mined annually, and approximately for every ton of coarse, two tons of fines and two of waste are shipped. Through the courtesy of Mr. F. C. Robinson, of the Sheffield Smelting Works, I am enabled to publish a few interesting assays which he made of the ore and gangue. The samples were taken from a stope on the 660 level, and the gold and silver values are stated in ounces per long ton.

Assays			Analyses	I	II
Number.	Gold.	Silver.			
I.	0.40	18.60	Insoluble ..	31.60	43.10
II.	1.05	7.85	Copper	43.00	13.60
III.	0.008	0.86	Iron	10.30	9.90
IV.	0.025	0.07	Lime	Trace	....

I. Bornite and chalcopyrite (massive ore).

II. Pyroxene and garnet gangue with finely disseminated bornite.

III. Calcite after removing mineralized portions.

IV. Calcite and garnet after removing mineralized portions.

Numbers III. and IV. are interesting in showing the occurrence of gold and silver in what was apparently barren gangue. Free gold in distinguishable leaves and grains has been found occasionally, but it is not a common occurrence.

SIMILAR DEPOSITS.

The ore chutes of the Copper Queen and Cornell mines adjacent to the Marble Bay are associated with basic dykes, some of which are older than the ore bodies. These are very much decomposed and in places have altered to a serpentine which carries ore, and is occasionally traversed by small veins of greenish white asbestos. The former mine has been noted for certain occurrences of free gold and argentiferous tetrahedrite. The deposits in the White Horse District, Yukon Territory, differ from the above, in that they carry low values in gold and silver, and higher values in copper. Their mode of occurrence, however, seems to be identical.

CONCLUSION.

The past development of these mines on Texada Island has proved the ore bodies to a considerable depth, the Copper Queen being 740 feet deep, while a winze is now being sunk to the 860 level in the Marble Bay. As regards the permanence of these deposits, there seems to be very little doubt but that they will continue until the limestone granite contact is reached.

Magnetic Concentration of Iron Ores by the Grondal Process

By P. McN. Bennie, FitzGerald & Bennie Laboratories,
Niagara Falls.

(Toronto Meeting, 1907).

The writer had the pleasure of attending the Toronto meeting of the Canadian Mining Institute, in March, 1904, when a very interesting paper on Magnetic Separation was presented by Mr. F. T. Snyder. The technics of the magnetic separation of various materials were well covered in Mr. Snyder's paper, so that those features need hardly be again referred to.

In the present paper it is proposed to give an account of progress in magnetic separation with a specific process, and to draw some conclusions as to its possible bearing on the utilization of certain Canadian iron ores or to the economic benefit of the Dominion.

It is not the intention to enter closely into mechanical details of the various forms of apparatus used in the Gröndal Processes for grinding, separating and briquetting iron ores. The results obtained in actual practice are probably of superior interest, and for this purpose a typical series of products may be taken, as follows:

1. Ore from Herräng, Sweden, ground in the Gröndal Ball Mill, as prepared for subsequent magnetic separation by the Gröndal Process.

2. Tailing from this Herräng ore, after passing through the Gröndal Magnetic Separator.

3. Concentrate from Herräng ore, showing the perfection of the separation.

4. Briquette made from such concentrates by the Gröndal Briquetting Process.

The composition of these various materials, with reference to iron, sulphur and phosphorus content, is as follows:

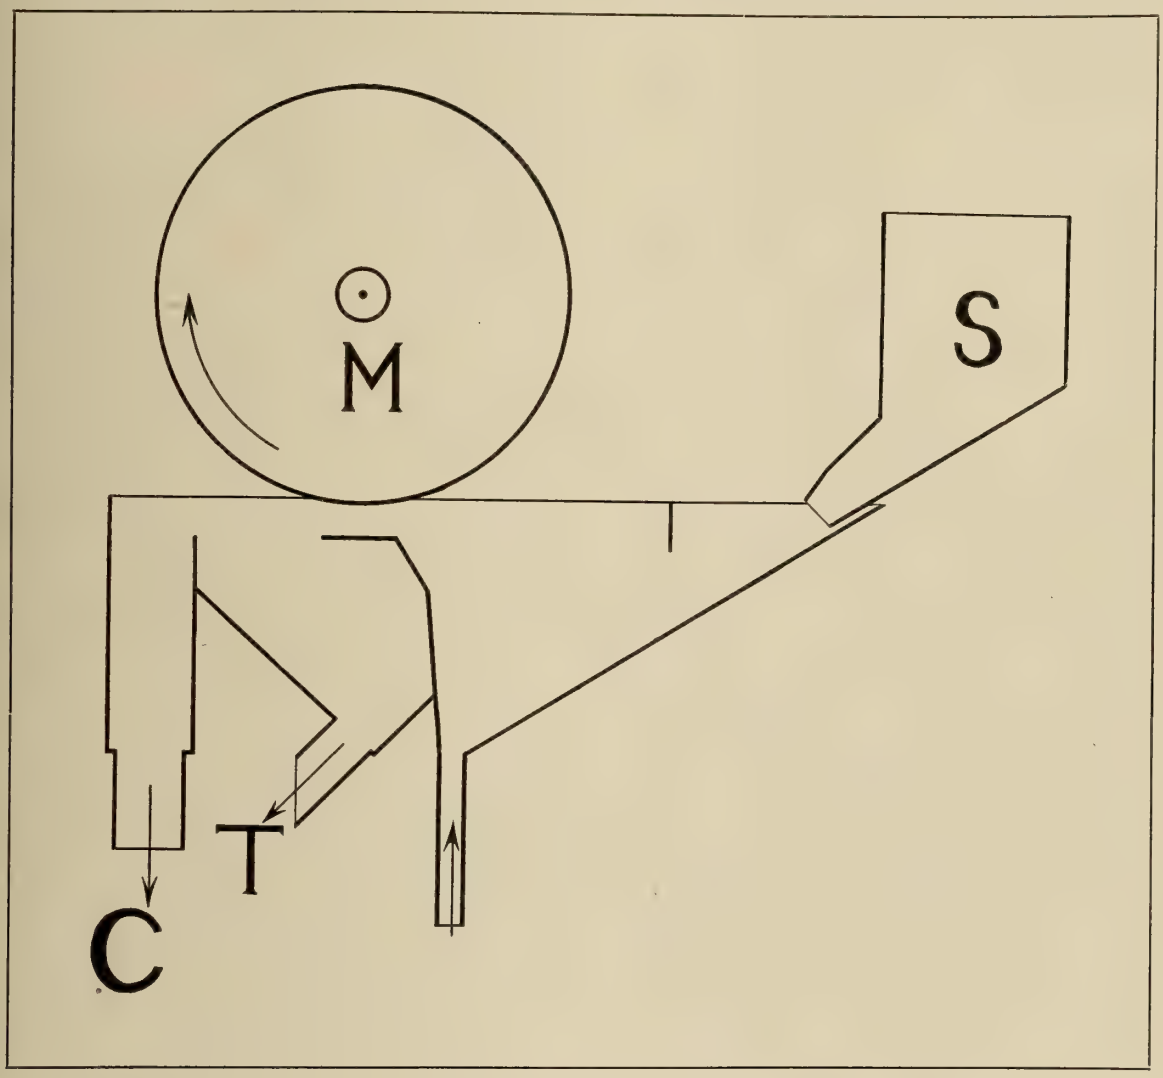
TABLE I.

Results of Treatment of Herräng Ore.

	Crude Ore	Concentrates	Slimes	Briquettes
	per cent.	per cent.	per cent.	per cent.
Iron	40.00	65.20	9.6	63.01
Sulphur ...	1.20	0.17	...	0.003
Phosphorus.	0.003	0.0025	...	0.0025

Porosity: Per cent. of volume of briquettes = 23.9.

DEVELOPMENT OF THE GRONDAL PROCESS.



About 20 years ago the question of iron ore supplies became serious, and at that time magnetic separation received considerable attention from Conkling, Ball and Norton, and others, with the idea of utilizing large bodies of magnetc iron ore which could only be made available by means of magnetic concentration.

Then came the rapid development of the immense bodies of Lake ore, of a quality which could advantageously be used in the blast furnace, and except in certain restricted districts, interest in magnetic ores was lost. About the same time there was some hope that the magnetic iron ore deposits in Ontario would receive serious development, and indeed a number of fairly large shipments were made to the United States. But the development of the Lake ore bodies practically closed that market, and work on the Ontario mines declined to insignificance. In fact the discovery of those same Lake Superior ore bodies has had an influence upon the metallurgical life of both Canada and the United States but little appreciated nowadays.

In European countries, however, especially in Sweden, conditions were different. The supply of suitable ores ready for blast furnace use in their natural condition was limited and low grade; in many cases highly phosphatic and sulphurous ores had to be used; consequently great efforts have been made to perfect concentrating methods. The attention of many prominent engineers and metallurgists has been turned, with more or less success, towards the solution of the difficult problems involved in turning to account these ore supplies.

Mr. Gustaf Gröndal's efforts in this direction, extending over a number of years, have been more successful, the appliances and machinery invented by him for crushing, concentrating and briquetting low grade and impure ores being now so perfected as to constitute a complete commercial process. By these methods a great many hitherto practically valueless iron ores can be turned to excellent account by reason of the richness and purity of the concentrates and briquettes produced, and the comparatively low cost of production.

Primarily the Gröndal processes permit of the economic use of the many, in some cases immense, deposits of iron ore which are found in various places throughout the world, and which are unsuitable in their native state, owing to some objectionable characteristic, for economic

blast furnace practice, and the production of good quality pig iron. Usually, the objection to their use will be found to be one of the following:

1. That the ore is too low in iron content.
2. That it contains impurities which cannot be eliminated in the blast furnace.
3. That it occurs in a mechanical condition unsuitable for blast furnace use, except to a limited extent, such as iron sands and small ores generally.

Among the ores which may be commercially utilized by the Gröndal Processes may be instanced:

1. Magnetites of all kinds, including magnetic iron sands, containing as low as 25 per cent. iron.
2. Magnetites containing a high percentage of phosphorus and copper not chemically combined with the iron.
3. Purple ore and pyrites residues.
4. Nearly all kinds of iron ores containing a high percentage of sulphur.
5. Flue dust.

The Grondal Concentrating Process.

The scheme of treatment is briefly as follows:

1. The ore is crushed dry to about ½ inch cube or thereabouts.
2. Wet treatment in a Gröndal Ball Mill, which reduces the ore from the crushed size to 10 to 100 mesh, as may be found necessary.
3. The ground pulp is passed through a Gröndal Magnetic Separator, where the non-magnetic particles are removed.
4. The concentrates are pressed into briquettes and heated in the Gröndal Briquetting Kiln, from which they issue as hard, porous, easily reducible, ferric oxide briquettes, with a minimum percentage of sulphur.

To take each operation in detail:

Any good type of commercial crusher may be used in the preliminary crushing of the ore. Usually either a Gates or Blake crusher is employed.

The broken ore is conveyed and distributed to the feed hopper on the Gröndal Ball Mills. The feeding arrangement consists of an ordinary roller feeder driven at a uniform speed and so constructed as to admit of accurate adjustment of feed. The ball mill consists of a hollow cylinder, 4 feet in diameter, and varying in width from 4 to 8 feet. It is reinforced with steel ribs and lined with manganese steel, or other steel alloy of good wearing quality. The mill is charged with about two tons of chilled cast iron balls, of about 6 inches diameter.

The ends are of cast iron with suitable openings provided with a screen at the discharge end. The degree of fineness of the ore is regulated by varying the amount of water introduced into the mill.

It is found that working with ores of average hardness the consumption of iron, represented mainly by the wear on the balls, amounts to about 2 pounds per ton of ore treated.

The mills require from 20 to 25 horsepower each, make from 25 to 30 revolutions per minute, and grind from 50 to 100 tons of ore per 24 hours, from ½ inch down to from 10 to 100 mesh in fineness.

In order to free the pulp from the bulk of the non-magnetic slimes, it is often advisable to pass the pulp coming from the ball mill through a slime box before charging it into the separator proper. The slime box consists of a V-shaped box, the pulp entering at the top and a stream of water at the bottom. The slime boxes are usually built in pairs, and between each pair is placed an electro-magnet with a hatchet-shaped pole piece. This electro-magnet is of such strength as just not to lift any magnetic particles out of the water. The velocities of the pulp and clear water are so arranged that the heavier particles settle at the bottom, from whence they are drawn off to the separator. The function of the magnet is to arrest magnetic particles in the fine slimes which collect on the surface of the water immediately under the pole piece, and from time to time drop to the bottom whence they are carried off with the main pump to the separators.

The accompanying diagram shows the principle of the separator proper. The pulp feed from slimes now passes to this part of the apparatus. This consists of a series of magnets with flat pole pieces arranged with their N and S poles alternately. The magnets are enclosed in a plain brass drum. This drum is made to rotate at a speed of from 80 to 100 revolutions per minute, and about one inch above the surface of the pulp, which traverses a pyramidal box divided into two compartments by a partition reaching nearly to the top of the box. The pulp enters at the top of the box, and a stream of water, entering at the bottom and rising up on the same side of the partition, carries all the pulp well over the edge of the latter and thus immediately under the drum. The magnets within the drum powerfully attract and bring the magnetic particles out of the stream of pulp and against the revolving brass drum. The remainder of the pulp drops down on the other side of the partition, and is carried off by the water through the waste outlet. The magnetic particles are lifted by the drum to the very edge of the magnetic field, where they are thrown off centrifugally. The capacity of the double-drum separator (which is the form commonly used) is from 70 to 100 tons of ore per 24 hours; it requires about 6 amperes at 120 volts, or say one horsepower, while less than ¼ horsepower will drive the drums.

A plant consisting of four ball mills, four double-drum separators, and having a capacity of fully 200 tons of concentrates per 24 hours, would require approximately 180 gallons of water per minute, and a power plant generating 150 e.h.p. would be ample for all the motive power required.

The concentration process reduces the percentage of phosphorus more or less, depending upon the mineral form in which it occurs in the ore. In most magnetites it is found in the form of apatite, in which case the phosphorus can be almost entirely eliminated. For example at Gellivare, Sweden, the phosphorus is reduced from 1.29 in the crude ore to 0.005 in the concentrates, and 0.006 in the briquettes. The percentage of iron is raised to a high figure, and at the same time the amount of slag-forming minerals is lowered. As a result the ore is more easily reduced in the furnace, and requires less fuel per ton of iron. The quality of the pig iron will be materially improved when using purer ore and less fuel than ordinarily.

Sometimes the ore mined is a mixture of magnetite and hematite. The dry magnetic concentrating methods hitherto employed give rather unsatisfactory results as regards the iron content of the tailing. With the Gröndal concentrating process, where the ore is already slimed up in water, a retreatment of the tailings on jigs or slime tables can be carried out with advantage, thus increasing the output of the plant without crushing or grinding any additional tonnage of ore.

The Gröndal concentrating process can be regarded as practically the only existing method for the economic treatment of low grade ores in which the magnetite is so finely and intimately mixed with the gangue that the

ore has to be crushed down to less than say 20 mesh before it can be separated. Take the case of the banded jasper ore in the Temagami district, which would require very fine grinding to effect an economic recovery of iron; the Gröndall Process could do this where no other could. But it is also obvious that such fine ores must be briquetted.

The Grondal Briquetting Process.

Concentrates produced by this process, iron sands, pyrites, residues, small ores generally, as well as ores containing a high percentage of sulphur, which are unsuited for use in the blast furnace, are next briquetted.

The material is conveyed to the briquetting process. These are drop presses—the height of the drop being from 6½ to 7½ inches, and the briquettes receive three blows, the falling weight being about 1,800 pounds. The briquettes may be of various sizes, but are usually made 6 in. x 6 in. x 3 in., weighing from 8 to 10 pounds each. Each press requires 3 e.h.p., and will make from 500 to 750 briquettes per hour. The pulverized ore is pressed into briquettes without any binding material whatever, the moisture in the ore being so adjusted as to obtain briquettes sufficiently firm to be removed from this press to the cars used in the furnace.

The briquettes are taken from the press and placed on the furnace cars. These are made of iron and covered with fire brick. Along each side of the car is a deep flange which dips into a channel filled with sand placed along the sides of the furnace, thus forming a gas-tight seal. The ends of adjacent cars are fitted with a groove and projecting rib respectively. By this means the surface of the cars forms a gas-tight partition and thus prevents the lower portion of the cars, frame, wheels, etc., from becoming heated. The cars measure 3 ft. 6 in., and hold from 15 to 16 hundredweight of briquettes arranged on edge in two tiers.

The Furnace.

The furnace is fired by gas derived preferably from gas producers, although blast furnace gas can be used. The combustion chamber is situated about one-third of the length from the intake end. The air needed for combustion is introduced below and traverses the row of cars, thus helping to keep the wheels and framework cool, and at the end of the furnace is diverted to the top of the row of cars, traversing the burnt briquettes, cooling them, and becoming itself heated before reaching the combustion chamber. The products of combustion pass over the entering cars, assist in drying and heating the briquettes, and finally escape through a stack at a temperature of only 150 deg. Centigrade. The furnace being thus constructed on the regenerative principle, has a very good thermal efficiency, radiation is small, and the chief loss of heat is due to the evaporation of the water contained in the briquettes (5 to 7 per cent.) A car of finished briquettes is drawn about every half hour, depending somewhat on the degree of desulphurization required. Recently, furnaces have been arranged so as to give a continuous movement to the cars, increasing the capacity of the furnace considerably.

The temperature in the combustion chamber of the briquetting furnace reaches 1,300 deg. to 1,400 deg. C. At this heat the particles agglutinate sufficiently to form a firm, hard briquette, able to stand rough handling and long transport. The briquettes, though hard, are very porous, and are consequently far more easily reduced in the blast furnace than ordinary lump ore. The briquette made from Herräng ore, previously mentioned, has a porosity of 23.9 per cent. of its volume.

When briquetting iron ore concentrates and using producer gas for fuel, the consumption of coal has been found to average 7 per cent. of the weight of briquettes burnt.

Grondal Briquettes.

The Gröndal Briquette is unique in that it does not contain an added binder, and, therefore, there is no foreign material such as lime, to be heated and slagged off. In the case of magnetic oxide concentrates the particles are completely peroxidized, owing to the very free supply of air given to the furnace during the process of burning the briquettes. Such peroxidized ore is very easily reduced in the furnace, thus introducing a certain fuel economy.

Treatment of Pyrites Residues.

Briquettes made by this process from pyrites residues and purple ore have proved to be entirely satisfactory in the open hearth steel furnace. At Cwmavon, ores containing 2 to 4 per cent. sulphur, and sometimes more, are being successfully treated by this process.

Capacity of Furnace.

The output of one furnace varies from 30 to 80 tons in 24 hours, according to the class of ore used, and the degree of desulphurization required; for in addition to its mechanical action this furnace acts as an exceptionally efficient calciner for removing practically all of the sulphur.

The following analyses of crude ore, concentrates and briquettes will give an idea of the results obtained by the use of the Gröndall Processes:

TABLE II.

Results of Gröndal Treatment.

	Iron.	Sulphur.	Phosphorus.
Herrang, Sweden.			
Shown in Table I.			
Gellivare, Sweden.			
Crude ore	58.96	0.036	1.29
Concentrates	72.38	0.003	0.005
Briquettes	69.49	0.002	0.006
Salengen, Norway.			
Crude ore	36.43	0.021	0.31o
Concentrates	71.76	0.015	0.008
Briquettes	.....	.....	.....
Pitkaranta, Finland.			
Crude ore	28.40	2.60	0.260
Concentrates	69.59	0.132	0.007
Briquettes	67.98	0.011	0.008
Cornwall, Penna.			
Crude ore	30.65	1.603	0.012
Concentrates	69.95	0.036	0.003
Briquettes	69.90	0.010	0.005

The results from Cornwall ore were obtained with a ten ton sample sent to Herräng about a year ago, as there is not yet a plant available on this side of the Atlantic.

Separation of Titanium.

At the FitzGerald & Bennie Laboratories, Niagara Falls, Ontario, a small separator of the Gröndal type was installed in June of last year, and some tests were made on the separation of titanium from ore, working with what are known as Moise Beach sands, from the St. Lawrence River. The following results were obtained:

Original ore	16.57 pct. TiO_2
Concentrate	4.21 "
Middling	19.48 "

It should be remarked that the concentrates were obtained by a single passage through the separator. Doubtless even better results could be obtained from finer grinding, and repassing through the separator.

Cost of Plant.

It is impossible to give anything but bare approximations as to cost of plant, which varies considerably with the local situation and conditions. The figures quoted are based upon cost of materials, and cost of erection, in the United States:

Concentrating plant for 400-500 tons of crude ore per day	$45,000
Briquetting plant for 200 tons of concentrates in 24 hours	65,000
	$110,000

For 100 tons of concentrate per day these figures would be about $27,000 and $39,000 respectively, a total of $66,000.

Cost of Concentrating.

The cost of concentrating will naturally vary with the character of the ore treated and the amount of iron contained in same. Assuming the treatment of an average magnetic iron ore, containing 40 per cent. iron, and the production of a concentrate carrying about 63 per cent. iron, the cost of concentrating varies from 30 to 45 cents per ton of concentrates. These figures refer to the mechanical treatment only, and exclude the cost of ore.

Cost of Briquetting.

The cost of briquetting is also an item varying with local conditions. A briquetting plant of 200 tons daily capacity would consist of four to seven furnaces, depending upon the ore, and to a large extent on the amount of sulphur to be removed. The cost per ton for briquetting can be taken, under normal conditions, as varying between 45 and 85 cents per ton.

At a small plant consisting of one furnace, producing 25 to 30 tons per day, the actual cost, including labor, coal, rent and taxes, but exclusive of depreciation and royalty, amounts to 85 cents. This plant is working on pyrites residues, and owing to its small size and nature of the work, the cost is high.

On the other hand, at a typical plant in Sweden, turning out 120 tons of briquettes daily, the cost of briquetting amounts to 77 cents per ton. At one of the Swedish plants of recent construction the cost has been reduced to 67 cents per ton.

Recently the briquetting furnace has been simplified and improved so as to materially decrease the cost of installation, and at the same time to lower the cost of briquetting.

Treatment fo Canadian Ores.

The present situation in Canada, and particularly in the Province of Ontario, is similar to that in the Scandinavian countries, in many ways. Not over blessed with ready fuel, and with iron ores that in many instances require concentration, yet it is well known that certain qualities of iron (Swedish pig, for example) are produced, which bring a premium on the market. There is no reason why Canada should not largely augment its production of high-grade pig iron, and have as great a demand for it as for the Swedish article.

There are many bodies of magnetic iron ore in Ontario, running from 35 to 50 per cent. iron, that would be so improved by proper treatment as to produce premium ores, for which there is now and probably will continue to be a brisk demand.

For ores that demand fine grinding to recover an economical percentage of iron content, the Gröndad briquette affords a means of converting unsalable ores into an article that will actually bring a premium, thus helping to pay for the cost of treatment. Only recently a blast furnace manager told me he would be glad to get 200 tons a day of such briquettes. Gröndal briquettes are now being shipped in considerable quantities from Sweden to Great Britain, where they command an instant market at prices above the average.

Electric-Thermic Processes.

Another feature certain to be of considerable economic value to Canada is the application of electro-thermic processes for producing high-grade pig iron and steel. Broadly speaking, the use of sufficient electrical energy to produce one ton of pig iron in the electric furnace means the displacement of about 1,600 pounds of fuel. Coal once used is gone forever, while water powers maintain themselves by a natural process, a fact of great economic importance to Canada. The fortunate existence practically side by side, of iron mines and extensive water powers, produce conditions very favorable to the electro-thermic process. The writer believes the Government would do well to foster the development of that branch of metallurgy as much as possible, to enable the country to realize on its natural and unique resources.

Many of the ores could doubtless be used direct, others would require concentration, and still others would have to be briquetted, but the economy of producing finished material wherever possible "on the spot" is obvious. Science and Art have now placed in the hands of those who will, means of utilizing these resources, and thus adding to the nation's wealth.

The monazite produced in the United States in 1906 all came from North and South Carolina. The output of crude sand amounted to approximately 2,000,000 pounds, averaging about 30 per cent. monazite. The grade of this sand was so variable and the prices realized on different lots were so irregular that cleaned sand has been used as an estimate of the quantity of monazite produced, an additional reason for so doing being furnished by the fact that the greater part of the crude material is cleaned by local mills before shipment, and the grade brought up to 80 per cent. or more of monazite. On a basis of 80 per cent. production, North Carolina produced 697,275 pounds of the mineral, valued at $125,510; and South Carolina 148,900 pounds, valued at $26,802; the total for the United States amounted to 846,175 pounds, valued at $152,312.

The production for 1905 amounted to 1,352,418 pounds, valued at $163,408. This amount represented in part crude and in part cleaned sand—a fact that explains the increase in quantity without correspoding increase in value.

The condition of the monazite market in the United States in 1906 was fairly strong, despite the fact that the price of thorium nitrate, which is manufactured principally from monazite, was reduced nearly one-half early in the year by the German thorium combine. Though made with the intention of killing all competition, this cut has resulted only in the temporary closing down or the bankruptcy of a few of the smaller companies.

THE RICHARDSON MINE

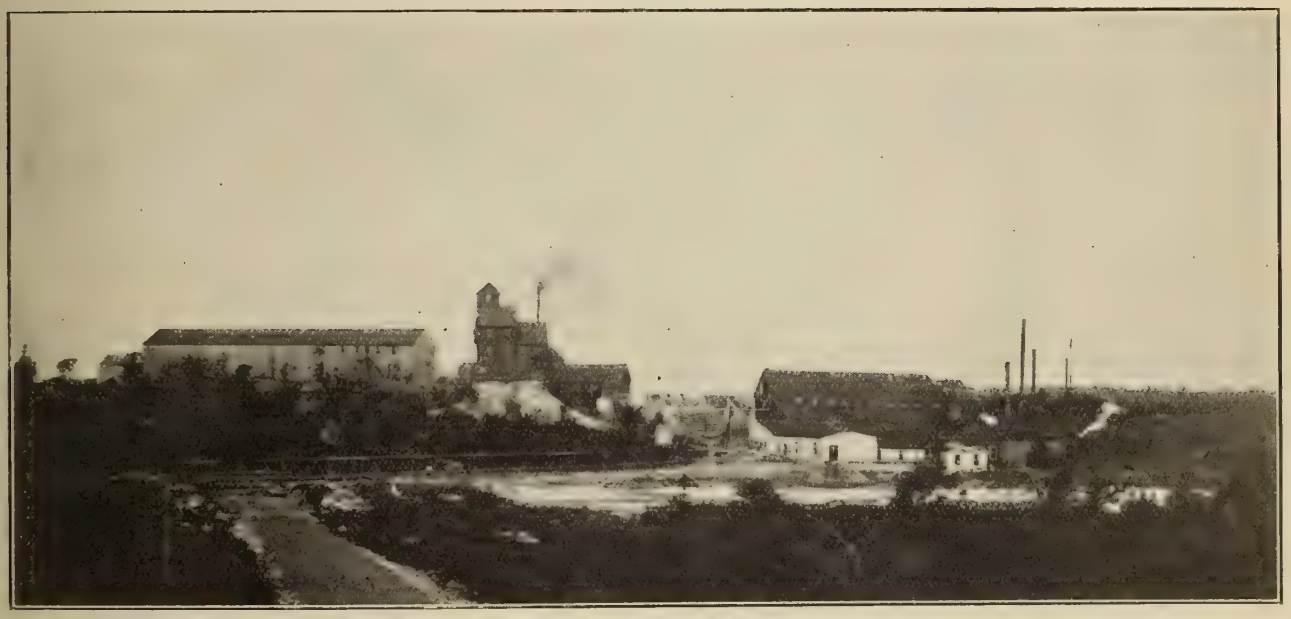
Upper Seal Harbor Gold District, Nova Scotia.

BY PERCY BROWN, M.E.

The Richardson Gold Mine is situated about two miles from the Village of Goldboro, Guysborough County, which is located on the east side of Isaacs Harbor, an important harbor on the Atlantic coast of Nova Scotia, some 80 miles east of Halifax.

The mine was discovered in 1892 by a prospector named Howard Richardson, who found rich quartz in the bed of a brook known as Gold Brook. This has given the name Goldbrook to the settlement which has sprung up in the vicinity of the mine.

Local capitalists became interested and a fifteen-stamp mill was erected in February, 1893. In July, 1894, this was enlarged to a twenty-stamp mill. In 1896 twenty stamps more were added and the plant modernized to a certain degree. The returns for these first four years are as follows:—



Year.	Tons. Crushed.	Yield. Ozs. Gold.
1893	5,408	2,054
1894	6,997	1,674
1895	10,293	1,677
1896	16,626	2,186
1897	25,150	3,004
1898	24,124	2,478

from 193.363 tons of quartz crushed, or a total value of nearly $600,000. It must be remembered that this value represents only the amount of free gold in the ore, and that large amounts went to waste can be seen by noting the amount of gold now being secured from the concentrates.

It is true that a large cyanide plant was erected to treat the tailings from the mill without concentration, but, while the percentage of recovery in the plant was satisfactory, yet the value of the mill tailings was too low to admit of economical treatment in this way.

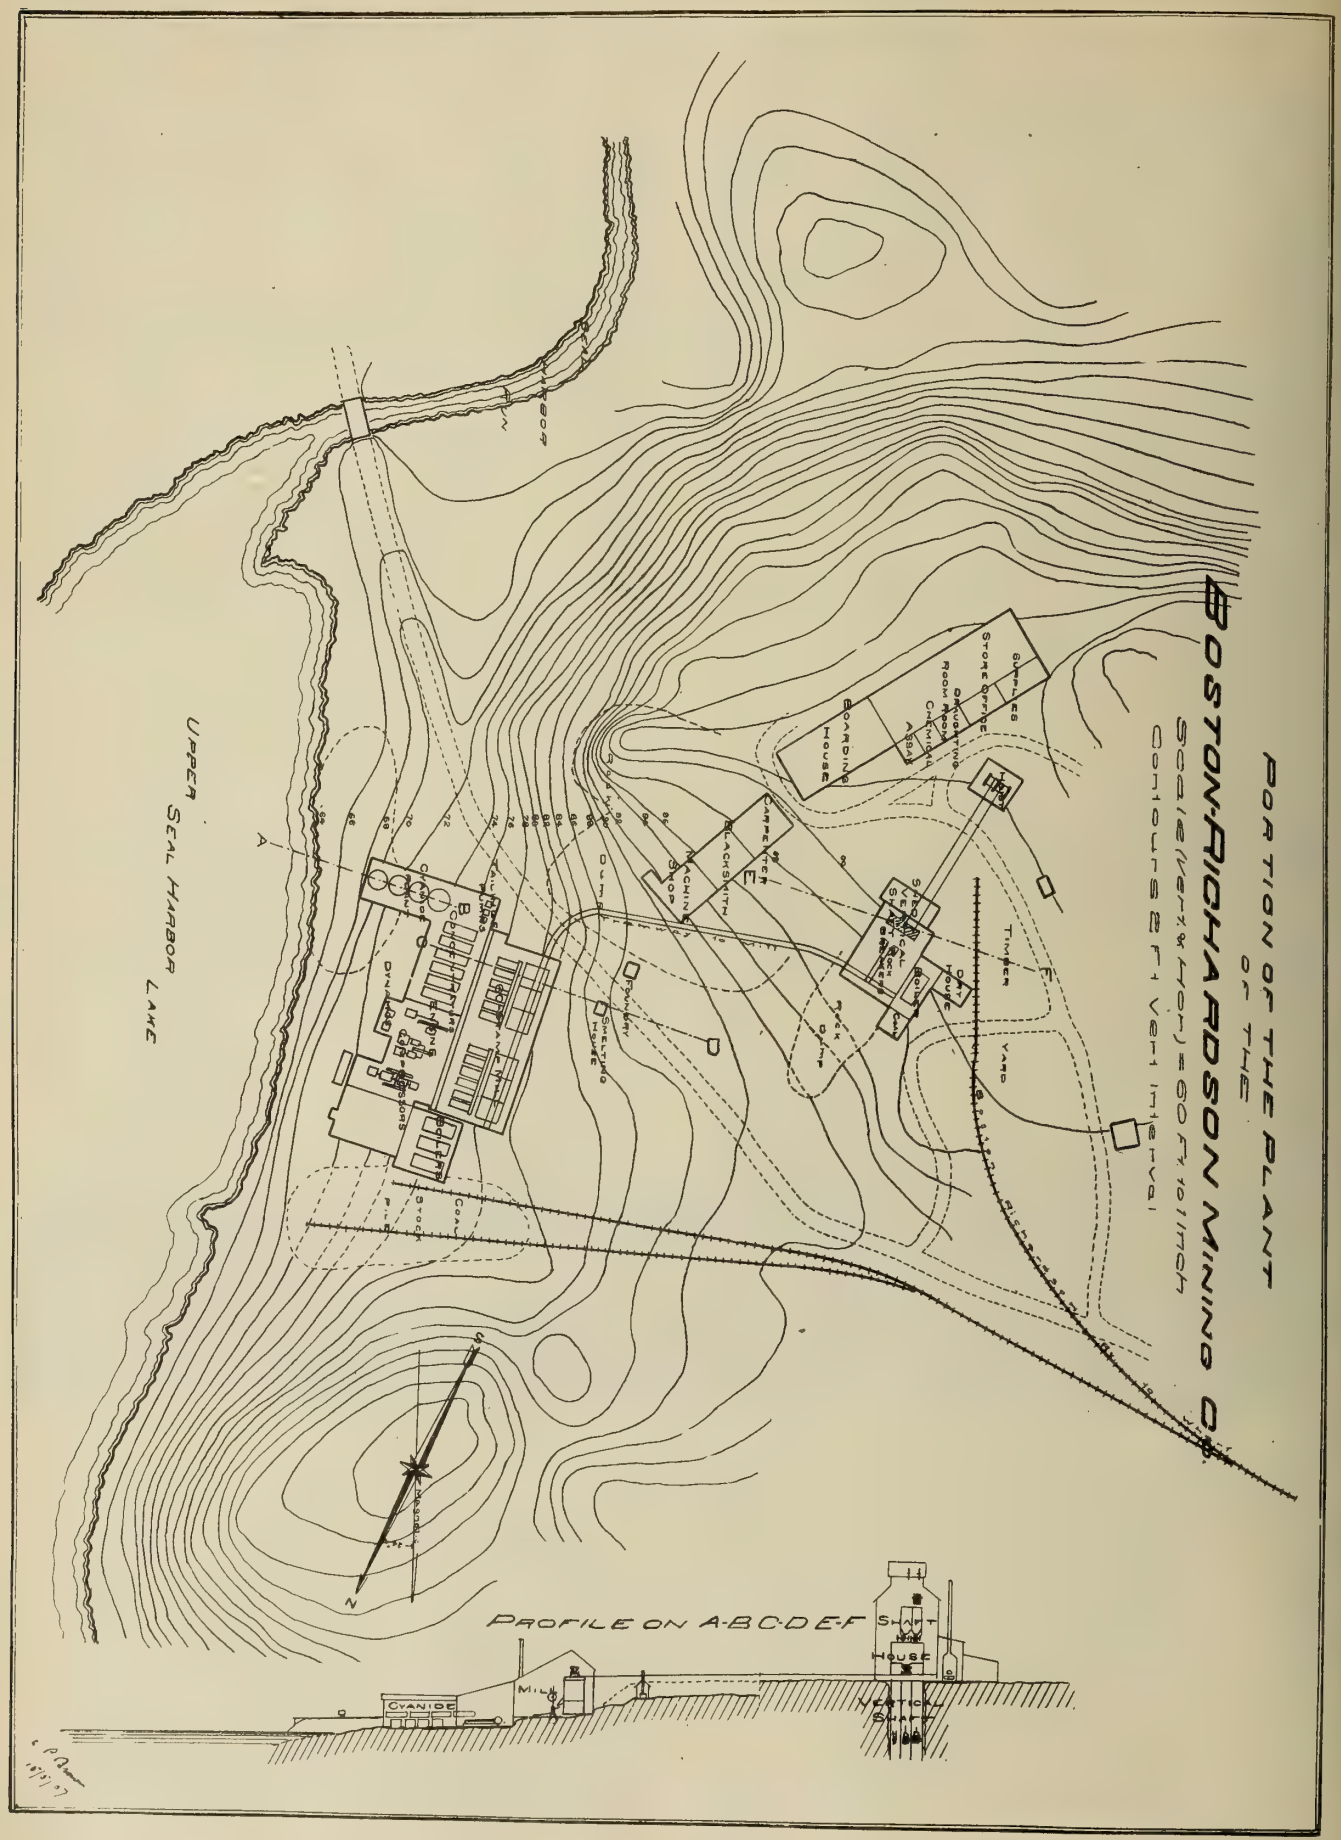
In 1903 the Richardson Mine was taken over by the present owners, The Boston Richardson Mining Company, who spent the first year of their ownership in carrying out a new system of development, namely, sinking a 400-foot vertical shaft, rebuilding the 60-stamp mill and putting the plant in its present shape.

The accompanying plan shows a portion of the plant and property of the Boston Richardson Mining Company. It does not show, however, the location of the other belts, similar to the Richardson, which are being opened about 1,000 feet east of the vertical shaft at what is known as East Goldbrook, or the very rich and promising, though probably smaller belts, cut near the

BOSTON RICHARDSON MINING COMPANY'S PLANT.—Looking West .

The ore body or belt consists of a mixture of bands of slate and quartz. Under the early management an attempt was made to sort the ore, throwing out the slate as worthless and milling the quartz. The result of this policy was that the mine was nearly closed down and the manager resigned. The new manager, not only milled the whole belt, but actually crushed the waste dump from former operations with most satisfactory results.

As a direct consequence of this policy the mill was enlarged to one of sixty stamps early in 1901.

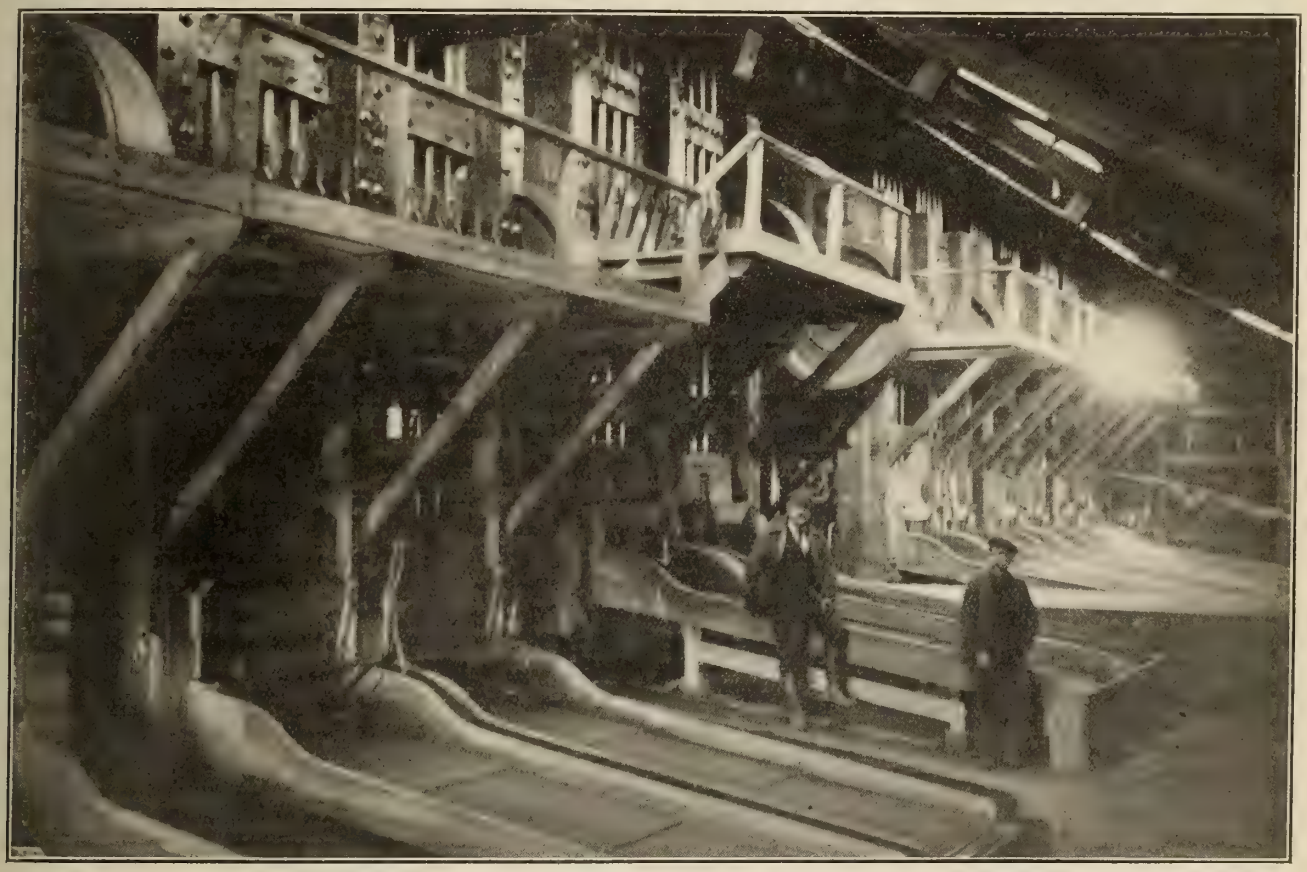


The total production of the mine from February, 1893, to December, 1902, as shown by the sworn returns at the Mines Office at Halifax, was 28.054 ozs. of gold

west end of the property, some 3,000 feet west of the vertical shaft, and known as West Goldbrook.

The geological conditions of the district are peculiar and will be the subject of a later paper. For the present it is sufficient to say that the outcrop or horizontal sections of the vein or belt has the shape of a horse-shoe.

The three main working shafts used in the original system of mining were sunk in this ore body and dipped to the north, east and south, respectively, coming to a common deck-head at the surface.



The old workings are situated about 800 feet west of the present vertical shaft, which cuts the apex of the belt, as it pitches eastward, at a depth of about 400

feet. From the bottom of this shaft levels have been driven westward on the north and south legs, the former being about 1,000 feet and the latter about 1,200 feet in length.

Raises have been driven upward towards the old works from these levels and the ore mined by a modern system of overhand or back stoping. In this connection it may be noted that the early management of the mine claimed they could not use the method of overhand stoping as the back would not stay up. The present management, although they have mined portions of the same ground, have not experienced this difficulty. The underground foreman says he finds the chief difficulty is that the back is too ready to stay up.

The ore is run into chutes, from which it is trammed to large bins at the bottom of the vertical shaft. It is hoisted from here to the surface in a self-dumping skip of two tons' capacity.

INTERIOR OF 60-STAMP MILL—BOSTON-RICHARDSON GOLD MINE.

The ore is dumped from the skip on to an inclined steel plate and grizzly, over which it is fed by hand to one of the two 9″ x 15″ Blake rock crushers. The crushed ore drops into a bin and is trammed to the mill in a side dumping car holding about 1½ tons. This work is so arranged that one man at the rock breaker and one man running the car can handle all the ore crushed by the 60 stamps in 24 hours during one shift of 10 hours. Four of the 10-stamp batteries in the mill are set on concrete foundations and two 10-stamp batteries on end wood. The results of the work here show conclusively that when concrete foundations are properly set and where rubber is used between anvil and mortar, that the concrete is more durable than wood.

The mill is equipped with suspended Challenge feeders. The stamps, newly shod, weigh 950 pounds each. They drop 7 to 7½ inches 95 to 98 times per minute. The height of discharge (top of die to bottom of screen) is about 6 inches. The screen now used is 18 by 24 mesh, No. 26 wire, twilled. Considerable experimental work has been done with regard to screens. Formerly one of plain wire, 30 mesh, No. 28 wire, was used; but this was discarded in favor of the one in use at present, as the first cost of this screen is about half as much as the other, it lasts almost twice as long, the efficiency of the stamps is greatly increased thereby and there is very little difference in the saving of gold.

The water is introduced at the back of the mortars and is so arranged that it strikes about half way up the die. No inside plates are used. The chuck blocks were originally provided with them, but their use has been discontinued. Silver-plated copper apron plates 12 feet in length are used and are found to keep in excellent condition as the amalgamators do not attempt to take off the amalgam too close. Under ordinary conditions the amalgam is removed twice a week. Mercury is fed to the batteries, the amount being judged by the "feel" of the plates. Five men are employed, 3 on day shift, 2 at night. The mill is cleaned up once a month in the usual way. Ten stamps only are cleaned up at one time, the rest of the mill running as usual.

From the apron plates the pulp passes to 6 Wilfley concentrators. The concentrates, which consist almost wholly of Arsenopyrite, are carried by a shaking sluice to a settling tank. From this they are shovelled to a ing box and thence to the treatment tank.

The method used is known as the Bromo-Cyanide process, and is a modification of that employed so successfully at Deloro, Ontario. The cyanide plant is very simple, and consists of:—

4 treatment vats 12 feet in diameter, 18 inches deep.
4 sump tanks, 6 feet diameter, 6 feet deep.
2 storage tanks, 6 feet diameter, 6 feet deep.
2 zinc boxes.
1 acid clean-up tank.

Two men, one on each shift, look after the concentrators and run the cyanide plant. One man is employed, on day shift, to load and unload the tanks.

It is the intention of the company to install at an early date a plant for the recovery of the arsenic.

The following table gives a summary of results for the past year:

Month.	Tons of Ore Milled.	Value Recovered in Mill.	Tons of Concentrates Treated.	Value Recovered in Cyanide Plant.	Total Value Recovered.
May, 1906	3,258	$8,041.00	82.02	$ 807.50	$ 8,848.50
June, 1906....	3,345	8,601.75	76.48	778.75	9,380.50
July, 1906....	2,964	7,072.84	78.25	722.16	7,795.00
August, 1906..	3,939	9,310.17	82.72	646.83	9,957.00
Sept., 1906 ...	3,441	9,082.87	32.78	439.13	9,522.00
October, 1906.	4,014	10,735.22	98.58	1,344.28	12,079.50
Nov., 1906 ...	4,326	9,186.72	132.11	1,847.78	11,034.50
Dec., 1906 ...	3,873	5,743.41	93.80	1,901.09	7,644.50
January, 1907.	3,024	6,493.08	134.03	1,933.24	8,426.32
February, 1907	3,283	7,517.23	143.03	2,610.72	10,127.95
March, 1907 ..	3,717	8,514.09	150.57	2,289.90	10,803.99
April, 1907 ..	3,837	9,612.03	185.12	2,044.29	11,656.32
	43,021	$99,910.41	1,289.49	$17,365.67	$117,276.08

The average cost of mining—operation and maintainance—during this time was *$135 per ton,* and it must be borne in mind that this cost covers, not merely the ore milled, which includes only about one-half the ore broken in the mine, but also the remainder which is left in the mine as filling until such time as the stopes in that portion of the mine are worked out. Thus at the present time there are over 20,000 tons of broken ore in the mine ready to be hoisted.

The above cost includes also the cost of all development and prospecting, sinking an incline shaft 22 feet x 10 feet for a depth of 400 feet from the 400-foot level to the 550-foot level, driving the greater portion of a 500-foot cross-cut and driving the levels and raises necessary to mining.

The average cost of Milling—operation and maintainance—for the year was *0.33 per ton.* The average cost of cyaniding for the past six months was $2.37 per ton of concentrates, or $0.08 per ton of ore milled. The following cost of supplies and scale of wages is given in order that the reader may intelligently compare the above costs with those in other places:

Coal, average cost, $4.00 per ton.
Dynamite, average cost, $0.20 per pound.
Wages—Drillmen, $1.75 per day.
Helpers, $1.50 per day.
Trammers and muckers, $1.50 and $1.35 per day.
Millmen, $40.00 to $65.00 per month.
Cyanide men, $2.00 per day.
Hoistmen, $2.00 per day.
Engineers, firemen and machinists, $1.65 per day.
Blacksmiths, $1.75 to $2.50 per day.
Carpenters, $1.60 to $1.75 per day.
Laborers, $1.35 per day.

The high price of coal may not be, as some of our authorities declare, the reason of the decline of the gold mining industry in Nova Scotia; but it certainly tends to greatly increase the cost of mining and milling.

The Boston Richardson Mining Company intend to greatly enlarge their milling capacity at an early date; indeed, ten extra stamps and accessories are now on the ground.

The Company also intend to change their system of power to electricity or gas, which will materially reduce costs.

My thanks are due to Mr. H. S. Badger, superintendent of the Boston Richardson Mine, for his kind assistance in the preparation of this paper.

PIG LEAD ANALYSES

The following is a list of analyses made by the Osaka (Japanese) Technical Analyzing Department. The Trail brand is electrolytic lead, produced by the Consolidated Mining & Smelting Company of Canada, Limited:—

Selby—Per cent. lead, 99.9579; per cent. insolubles, 0.0040; per cent. bismuth, 0,0300; per cent. cadium, trace; per cent. nickel, 0.0001; per cent. cobalt, none; per cent. silver, 0,0010; per cent. manganese, 0.008; per cent. copper, none; per cent. antimony, none; per cent. tin, 0.0004; per cent. arsenic, 0.0024; per cent. zinc, 0.0003; per cent. iron, 0.0027.

Trail—Per cent. lead, 99.9890; per cent. insolubles, trace; per cent. bismuth, none; per cent. cadium, none; per cent. nickel, trace; per cent. cobalt, none; per cent. silver, 0.0025; per cent. manganese, none; per cent. copper, 0.0003; per cent. antimony, none· per cent. tin, 0.0007; per cent. arsenic, 0.0020; per cent. zinc, 0.0002; per cent. iron, 0.0053.

Smelter—Per cent. lead, 99.9762; per cent. insolubles, trace; per cent. bismuth, 0.0046; per cent. cadium, 0.0002; per cent. nickel, trace; per cent. cobalt, trace; per cent. silver, trace; per cent. manganese, 0.0003; per cent. copper, none; per cent. antimony, 0.0137; per cent. tin, none; per cent. arsenic, 0.0090; per cent. zinc, trace; per cent. iron, 0.0039.

English Chemical—Per cent. lead, 99.9693; per cent. insolubles, trace; per cent. bismuth, trace; per cent. cadium, 0.0007; per cent. nickel, 0.0003; per cent. cobalt, trace; per cent. silver, 0.0020; per cent. manganese, none; per cent. copper, 0.0097; per cent. antimony, 0.0149; per cent. tin, none; per cent. arsenic, 0.0002; per cent. zinc, trace; per cent. iron, 0.0029.

B. H. P.—Per cent. lead, 99.9853; per cent. insolubles, trace; per cent. bismuth, none; per cent. cadium, trace; per cent. nickel, none; per cent. cobalt, none; per cent. cobalt, trace; per cent. silver, 0.0009; per cent. manganese, none; per cent. copper, none; per cent. antimony, 0.0108; per cent. tin, 0.0004; per cent. arsenic, none; per cent. zinc, 0.0001; per cent. iron, 0.0025.

Enthoven—Per cent. lead, 99.9851; per cent. insolubles, trace; per cent. bismuth, 0.0048; per cent. cadium, trace; per cent. nickel, trace; per cent cobalt, trace; per cent. silver, 0.0015; per cent. manganese, none; per cent. copper, none; per cent. antimony, 0.0160; per cent. tin, none; per cent arsenic, none; per cent. zinc, trace; per cent. iron, 0.026.

Note.—Selby and Smelter are American; Trail, Canadian; Enthoven and Chemical, English; B. H. P., Australian.

NOTES ON THE MINERAL FUEL SUPPLY OF CANADA

R. W. Ells, D.D.

(Abstract of paper read before the Royal Society of Canada.)

In discussing the question of mineral fuels, a number of substances other than coal proper must be considered. The coals themselves include several varieties, such as anthracite, which is found along the eastern flank of the Rocky Mountains, and to some extent on one of the Queen Charlotte group of islands in the Northern Pacific Ocean; the true or bituminous coals with their resulting coke, and the lignitic coals and lignites which are not capable of being coked, and which vary from brown to black and in quality from a fuel nearly equal to many of the true coals to others not far removed from peat. In addition to these, the minerals anthraxolite, oil shale, albertite and petroleum and natural gas must all be regarded as forms of fuel. They are often found in large quantities and at many widely separated points; while the immense stores of peat are bound to become valuable in a few years.

At points where the distance from coal fields is great, peat must become locally valuable. This is true of Quebec, Ontario and Eastern Manitoba.

The geological horizons of the several coal deposits found in Canada extend from the Devonian upward into the Tertiary. Of the other fuels, some of them range downward to our lowest rocks, anthraxolite, which is a form of carbon, being found in those of Huronian and Cambrian age. The geological horizons of the workable coals are, however, rather more limited, although even here the early ideas that the economic deposits of coal belonged especially to the Carboniferous time have long been set aside, by the fact that many of the highest grade coals of the West belong to comparatively recent rocks and extend through the Cretaceous to the middle Tertiary. These Western coals present several varieties in the same field, the difference being due apparently to various degrees of alteration of the original deposit of carbonaceous matter.

Anthraxolite is more closely related to the rock oils or petroleum than to the true coals It is found in widely separated horizons. In its mode of occurrence it differs entirely from coal, in that it is always found in the form of veins which traverse strata of different ages instetad of occurring as bedded deposits. From its presence in the rocks of the Laurentian and Huronian systems, as well as in the Cambrian and Silurian formations, it would, on the hypothesis that all bituminous substances are of organic origin, indicate that life in some form existed in the remotest periods of the earth's history.

Anthraxolite is the oldest mineral fuel. In Labrador it has been found in veins some inches wide, traversing the Cambrian rocks; in Quebec, along the St. Lawrence, near Point Levis, and on the Island of Orleans, it occurs in pockety masses in slates and sand stones of upper Cambrian age. It is also found in Ontario in black Cambrian slates; in granite as veins of very pure quality; and in limestone in association with veins of barite. Anthraxolite has no economic importance as a fuel.

Closely allied to anthraxolite in composititon are petroleum and asphalt, as also to some extent the peculiar form albertite, which was at one time largely mined in New Brunswick, and which also was exceptionally free from ash. As a class these minerals are quite distinct from the several varieties of coal proper, in composition and in origin.

In some areas where oil wells occur the oil has come to the surface and become thickened, forming what are known as gum-beds. This material was found in large masses in the Petrolia oil fields prior to tthe discovery of the oil itself in quantity. But in the case of the albertite of the Albert mines in New Brunswick, this thickening of the natural oils must have recurred through some cause other than exposure, since this mineral filled a fissure in bituminous slates to a depth of 1,500 feet, with a length of over half a mile.

In the matter of hard coal or anthracite, the people of Eastern Canada are to a large extent dependent upon the immense deposits which occur in the eastern portion of the United States; but in all other varieties it will be found that Canada has an unlimited supply, much of which is readily accessible. Anthracite, also, of excellent quality and of great extent, is found along the eastern slopes of the Rocky Mountains.

The existence of coal fields in Southwestern Newfoundland has been known for many years. These may possibly represent the extension eastward of the Sydney coal basin. The actual extetnt and value of these coal basins have never been definitely ascertained.

In Nova Scotia the coals are for the most part confined to the Carboniferous formation and the largest workable seams belong to the middle portion, or what is usually styled the productive coal measures. This formation is found at Sydney, on the eastern coast of Cape Breton, and in Richmond and Inverness, on the west side of the island; at Pictou, in the eastern part of Nova Scotia proper; and at Springhill and the Joggins in the northwest of the Province.

Seams of considerable size are found in tthe underlying portion of the Carboniferous, otherwise known as the millstone-grit formation, and occasionally the mineral occurs in the upper Carboniferous or Permian, where coals of no great thickness have been recognized in that part of the Counties of Colchester and Pictou.

All the coals at present worked in the Province are of the bituminous variety. Associated with the Pictou coals are occasional seams of rich bituminous oil shale, known as stellarite, from which oil can be distilled.

In the southern half of Nova Scotia, which is occupied by great areas of granite, slates, quarttzite, etc., no trace of coal is found.

The Sydney coal field extends along the eastern shore from Mira Bay on the southeast to Cape Dauphin at the entrance of Bras D'Or Lake. Mr. Hugh Fletcher estimates the area of the basin as about 200 square miles. The aggregate thickness of coal in the several workable seams varies from 13 1-2 feet in the Dauphin area to 44 1-2 feet in Sydney Harbor, the seams ranging from 3 to 9 feet in thickness. The dip is generally at a low angle seaward.

On the west side of the island of Cape Breton, in Inverness and Richmond Counties, large and important coal basins are located, the seams being thick and of good quality.

On the mainland the thick seams of the Pictou basin have been producers of coal for more than eighty years. In this area are comprised some of the largest seams

in Eastern America, the main seam in the Sttellarton area having a thickness of forty feet, with several others in the vicinity of very large size.

In the Cumberland basin, as seen at Springhill mines, there are a number of seams, many over ten feet thick. These have been worked for more than thirty years. In tthe western part of this basin, along the shore of Cobequid Bay, is the old colliery known as the Joggins mine, showing thin seams, the thickest only five feet. These seams extend along the margin of the Springhill basin, and along the outcrops are a number of small collieries.

(To be continued.)

CRYSTALLIZATION OF ASBESTOS

By W. J. Woolsey, Cobalt, Ont.

During the past winter I obtained hand samples of serpentine from the various producing localities in the Eastern Townships, Quebec, and had rock sections made for examination under the miscroscope.

Work on the various sections exhibited the characteristics commonly noted in the serpentines. One section, however, exhibited the phenomenon of crystallization of the chrysotile in a marked degree, as shown by the accompanying micro-photograph.

It will be observed that the crystallization extends from a cleavage plane outward in either direction. The concentration of the impurities to this centre accounts for the accumulation of foreign material so frequently found in the centre of the asbestos veins.

TRIPOLI DEPOSITS IN CALIFORNIA

The diatomaceous deposits so widely distributed in the coast ranges of California are found in such purity and such inexhaustible quantities in Northern Santa Barbara County as to give them great commercial value, and it is for this reason that a description of the occurrences is included by the United States Geological Survey in the Contributions to Economic Geology for 1906 (Bulletin No. 315). The paper was prepared by Messrs. Ralph Arnold and Robert Anderson as the result of field work in 1906 in the Lompoc and Guadalupe districts.

The deposits are variously known as infusorial earth, tripoli, diatomaceous earth, and, in Santa Barbara County, "chalk rock." The most appropriate of these names is diatomaceous earth, as the material is composed almost entirely of the skeletons of minute organisms called diatoms—one-celled plants that adapt themselves to a wide range of conditions of depth and temperature in fresh or salt water and secrete siliceous casings around their organic matter. They must have lived in great abundance in the sea that ages ago covered this part of the land, for the rock was built up of the little shells of these plants that dropped to the sea bottom. Examination with a hand lens always reveals a large number of the round forms of the diatom shells thickly imbedded in the shale. Many of these shells are in a good state of preservation, and in some of the material they can be plainly distinguished with the naked eye. The name "chalk rock" is inappropriate, for although the deposits resemble chalk in appearance, they are made of siliceous instead of calcareous material.

The uses to which the diatomaceous earth are put are constantly increasing, and the methods of application are developing. Formerly employed solely for abrasive purposes, it soon became useful in the manufacture of polishing powders, soaps, etc.; but its abrasive quality makes it a good absorbent and it is extensively used in the manufacture of dynamite from nitroglycerine. Being very light and a poor conductor of heat, it is valuable for use in the manufacture of packing for safe, steam pipes, and boilers, and of fireproof building materials. It also serves as a base for the manufacture of cement suitable for withstanding heat. It is a good filtering substance and is so used commercially. Some of the earth from the Lompoc region is said to be used in the refining of beet sugar. In the Lompoc region and also at Monterey, farther north on the California coast, it is used in the construction of buildings. The shale is easily quarried into smooth blocks which can be readily placed in position. The blocks are compact and yet elastic under changes of temperature, seem to possess sufficient strength, and are very resistant to weathering. As a building material it is finely adapted to a region subject to earthquakes, for the shock effect on a substance so light would probably be the minimum and a smaller amount of damage would result from falling materials. The Santa Barbara County deposits are rendered exceptionally valuable by their proximity to railroad and ocean transportation facilities.

The paper referred to includes descriptions of the various occurrence of the diatomaceous earths, a discussion of their physical and chemical properties, and statistics of production in the United States. It may be obtained by applying to the Director, United States Geological Survey, Washington, D.C.

MINING IN THE BOUNDARY DISTRICT

Mr. Frederic Keffer, the president of the Canadian Mining Institute, and engineer of the British Columbia Copper Company, contributes an interest article to the current number of *The Engineering Magazine*. on "Mining in the Boundary District." While, naturally, the information given is not all new, the subject is treated for, perhaps, the first time in a manner at once concise and comprehensive. Mr. Keffer points out that four general conditions have contributed to the successful mining and smelting of the low grade ores of the district, these being: (1) The enormous extent of the ore bodies, admitting of mining on a large scale; (2) the solidity and firmness of the ground which renders the opening of great stopes without the use of timbers feasible and safe; (3) the chemical composition of the ores, which, by rendering them self-fluxing, obviates the use of any barren fluxes; and lastly, the presence in the near neighborhood of coal areas, by which a cheap and abundant supply of fuel is made available. Had any one of these conditions been absent, it is questionable whether mining in the Boundary could have been profitably carried on. The district enjoys the advantage also of an abundant water and timber supply, while the mines generally are dry and require little pumping.

The mining methods employed are two, one by open pits or "glory holes," and the other by pillars and stopes. The former may only be employed where the overburden of soil rock is not too great, and is most effective in mines where the dip of the ore deposit is high. But, owing to the low dip of many of the deposits, glory hole work is necessarily limited, and, as square-set timbering in underground work is imposible on account of the prohibitive cost, the usual plan is to open stope above a roof supported by pillars of ore.

The writer notes that the great irregularity in form of the deposits necessitates that each section of the work, even in the same mine, must be treated individually, and plans made to suit the form and dip of the ore contained in that section.

In the British Columbia Copper Company's Mother Lode Mine the ore is all conveyed to the main shaft, where it is dumped into pockets. The cars mostly used have a capacity of from 2 to 2 1-2 tons, and are drawn by horses in trains of from 4 to 5 cars. The ore is drawn from the pockets into 5-ton skips, and hoisted to a bin at the surface, whence it passes to electrically driven Blake crushers. From the crushers the ore falls on to a conveying belt, which carries it to the railway bins. At the Granby Mines most of the haulage is done by electric motors and steam locomotives, bins being located at two tunnel entrances to the mine on the upper levels. Here the ore is crushed in crushers with jaw openings of 30 and 42 inches, and then passed to railway bins. The ore from the Dominion Copper Company's mines is delivered directly to the railway bins without crushing.

Steam power has been practically displaced in the Boundary by electricity, which is generated at Cascade and Bonnington Falls. The capacity of the former plant is 2,000 to 3,000 horse-power, while the larger plant at Bonnington is capable, it is estimated, of generating 60,000 horse-power at low water.

The progress of mining in the Boundary is indicated by a comparison of the tonnage of ore smelted in 1900, which was 62,389 tons, and the returns for last year, 1,276,589 tons.

RICHNESS OF COBALT ORES*

By Dr. Albert R. Ledoux, New York.

I have been asked by several members of the Institute what is the grade of Cobalt ores, as determined by my sampling works in Jersey City. Since January, 1905, we have handled at our works 366 carload lots of this ore, and 52 other lots—less than carloads—including what we call nuggets, the nuggets either coming separately consigned or as part of a carload. I do not feel at liberty to state the assays of any particular lots of nuggets, as there have been some delicate questions concerning the value of some of these "Bonanza shipments." These nuggets, as you are aware, are not pure silver, but run anywhere from 700 parts to 870 parts of silver in the thousand. There are more or less gangue and other minerals associated with the silver, and the metallic silver itself, visibly free from gangue, runs about 950 fine.

Leaving out of consideration the nuggets and native silver, and including only the lots of regular ore, a review of 394 lots sampled shows that the highest lot ran 7,402 ounces of silver to the ton, the next in order being 6,909, 6,413, 6,163 and 5,948 ounces per ton. In the 394 lots we found:

							Per cent.
Over	6,000 ozs.				4 lots	(say)	1
Between	5,000 ozs.	and	6,000 ozs.		3 lots	(say)	0.75
Between	4,000 ozs.	and	5,000 ozs.		12 lots	(say)	3
Between	3,000 ozs.	and	4,000 ozs.		17 lots	(say)	4.25
Between	2,000 ozs.	and	3,000 ozs.		30 lots	(say)	10
Between	1,000 ozs.	and	2,000 ozs.		72 lots	(say)	18.25
Between	900 ozs.	and	1,000 ozs.		11 lots	(say)	2.75
Between	800 ozs.	and	900 ozs.		7 lots	(say)	1.75
Between	700 ozs.	and	800 ozs.		12 lots	(say)	3
Between	600 ozs.	and	700 ozs.		21 lots	(say)	5.25
Between	500 ozs.	and	600 ozs.		10 lots	(say)	2.5
Between	400 ozs.	and	500 ozs.		13 lots	(say)	3.25
Between	300 ozs.	and	400 ozs.		20 lots	(say)	5
Between	200 ozs.	and	300 ozs.		44 lots	(say)	11.25
Between	100 ozs.	and	200 ozs.		66 lots	(say)	17
Less than	100 ozs.	and			43 lots	(say)	11

You are of course aware that while the greater part of shipments of cobalt have come to New York, some have gone abroad and many have gone to Copper Cliff.

It seems to me that this is a remarkable showing for a camp so young as Cobalt, the first car having reached our sampling works about the first of February, 1905.

Silver, of course, in point of value, is the more important element. The highest percentage of cobalt found in any one shipment is 11.96 per cent., the average being 5.99 per cent. The highest assay for nickel in any car is 12.49 per cent., the average being 3.66 per cent. The highest percentage of arsenic is 59.32 per cent., the average 27.12.

Discussion.

Mr. Campbell—Could you tell us, in the case of these nuggets and of the silver, what it was which makes them less than one thousand fine?

Dr. Ledoux—There are mixed up with the nuggets other minerals; sulphides, arsenides, etc., and the gangue matter. We have paid no attention as to what reduces the fineness of the native silver—we do not know what it is.

---

*The above formed the subject for a brief address by Dr. A. R. Ledoux, following the reading of papers on the Cobalt District at the Toronto meeting, 1907.

PRODUCTION OF COAL IN 1906

According to statistics compiled for the United States Geological Survey by Edward W. Parker, coal mining expert in charge, the total production of coal in the United States in 1906 was 414,039,581 short tons of 2,000 pounds, valued at $512,610,744. These figures, compared with those of the preceding year, when the output amounted to 392,919,341 short tons, valued at $476,756,963, show an increase of 21,120,240 short tons, or 5.4 per cent. in quantity, and of $35,853,781, or 7.5 per cent. in value.

Of the total production in 1906, Pennsylvania contributed 200,546,084 short tons, or 48.4 per cent., in quantity, and $262,182,935, or 51.1 per cent., in value, the larger percentage in the value being due, of course, to the higher value of anthracite, which is produced almost exclusively in that State.

The anthracite production of Pennsylvania in 1906 was 63,645,010 long tons (or 71,282,411 short tons), valued at $131,917,694, while the bituminous production was 129,263,673 short tons, valued at $130,265,241. The anthracite production of Pennsylvania in 1906 was 5,694,142 long tons (or 6,377,439 short tons) less than that of 1905, with a dcrease in value of $9,961,306, while the bituminous production showed an increase of 10,850,036 short tons in quantity and of $16,874,734 in value.

One of the interesting facts presented in the statistics of coal production last year is that West Virginia has supplanted Illinois as the second coal-producing State, West Virginia showing a total output of 43,276,485 short tons, while the production of Illinois was 41,497,435 short tons. This was due principally to the almost complete suspension of mining in Illinois (as in other States where labor union forces were strong) during all of April and a part of May, when the miners and operators were in conflict over the wage scale, whereas the majority of the operations in West Virginia were more actively worked, as a result of the suspension of work in the other districts.

Notwithstanding, however, the loss of from six to eight weeks in the States where mining operations were suspended, there was a general increase in production east of the Mississippi River, the only exceptions noted being in Michigan, Georgia, and North Carolina. In Illinois, where the question of the wage scale is most sharply contested, the production increased from a total of 38,434,363 short tons in 1905 to 41,497,435 short tons in 1906. Indiana's production of coal increased from 11,895,252 short tons in 1905 to 12,084,281 short tons the following year. Ohio's production increased from 25,552,950 short tons in 1905 to 27,729,843 short tons in 1906, while the bituminous production of Pennsylvania increased from 118,413,637 short tons in 1905 to 129,263,673 short tons in 1906.

In West Virginia, where there was no suspension of mining, the output of coal increased from 37,791,580 short tons in 1905 to 43,276,485 short tons in 1906.

Among the other coal-producing States in which there was an increased production in 1906 were Alabama, Colorado, Iowa, Kentucky, Maryland, Montana, New Mexico, Tennessee, Virginia, Washington, and Wyoming. In addition to the three States previously named in which decreases occurred, the following showed losses in tonnage: Arkansas, Indian Territory, Kansas, Michigan, Missouri, Texas, California, Oregon and Alaska. In California, Oregon, Arkansas, Indian Territory and Texas the decreases were due principally to the use of fuel oil. In Kansas, Michigan and Missouri the decreases were due, in the main, to the fact that in these States the industry did not recover from the idleness previously referred to.

PRODUCTION OF COAL IN 1906, BY STATES.

State.	Production.	Value.
Alabama	13,107,663	$17,467,886
Arkansas	1,864,518	2,999,774
California and Alaska	30,831	78,684
Colorado	10,114,074	12,738,509
Georgia and North Carolina	363,463	407,247
Idaho and Nevada	6,165	24,238
Illinois	41,497,435	44,742,440
Indiana	12,084,281	13,105,168
Indian Territory	2,859,450	5,481,053
Iowa	7,321,639	11,688,598
Kansas	6,010,858	8,935,195
Kentucky	9,673,536	9,794,823
Maryland	5,434,528	6,473,829
Michigan	1,336,338	2,402,529
Missouri	3,755,778	6,163,449
Montana	1,787,934	3,186,620
New Mexico	1,963,558	2,635,571
North Dakota	300,998	437,894
Ohio	27,729,843	30,386,297
Oregon	79,731	212,338
Pennsylvania:		
Anthracite	71,282,411	131,917,694
Bituminous	129,263,673	130,265,241
Tennessee	6,262,686	7,682,121
Texas	1,160,707	2,058,731
Utah	1,773,847	2,411,992
Virginia	4,275,815	4,207,521
Washington	3,276,184	5,908,434
West Virginia	43,276,485	40,777,382
Wyoming	6,138,152	8,019,486

The calorimeter is an instrument of value in the hands of a trained chemist. For any given class of coals it gives an excellent standard of comparison. But when a large number of determinations are to be performed on coals of widely differing composition, it is often necessary to correct and adjust results. This means that each fuel develops its own "error" and a correcting factor must be found for each. Results obtained by means of the calorimeter must not be considered absolute. Relatively they are correct. But unless refinements are introduced, making the work too tedious and elaborate for commercial purposes, it is not desirable that comparisons based upon calorimeter results should be instituted between coals of different characters.

The same general truth applies to commercial laboratory work. While the determination of some of the elements is simple and should always be accurate, there are operations, such as the volumetric determination of sulphur in pig iron, where a constant error is observable. Exactness is here sacrificed for speed. So long as the error is constant no harm need be done

GEOLOGICAL SURVEY OF CANADA

PROPOSED DISTRIBUTION OF FIELD PARTIES, SEASON 1907.

YUKON:

Messrs. McConnel and Maclaren.—An examination of the mineral areas of the southern portion of the territory, including the copper deposits of Whitehorse and the rich silver deposits of Conrad.

Mr. Cairnes—The mapping and investigation of the coal areas along the Yukon River, between Whitehorse and Tantalus.

Mr. Keele—An examination of the upper waters of the Pelly and Hoole and Kiza Rivers, extending over two seasons, the return journey to be made across the mountains, and thence to Dawson by the Mackenzie, Rat and Porcupine River route.

BRITISH COLUMBIA:

Mr. J. A. Bancroft—Continue the examination of the rocks and minerals northward from Texada Island, giving particular attention to the copper and iron deposits.

Mr. Leach—Continuation of the mapping and investigation of the coal and copper areas in the vicinity of the Bulkley Valley, Skeena River.

Mr. Camsell—Continuation of the mapping and geological investigation of the Similkameen valley.

Messrs. Brock and Boyd—Completion (in two or three weeks) of the Rossland, or continuation of the mapping and geological investigation of the Lardeau camp. If possible, investigations in the Slocan district.

ALBERTA:

Mr. Malloch—Continuation of the mapping of the Cascade, Palliser and Costigan coal fields in the Rocky Mountains, between the Red Deer and Clearwater Rivers.

SASKATCHEWAN:

Mr. McInnes—Examination of the country lying to the north of the Canadian Northern Railway, and extending to the north of the Saskatchewan River to 50° N. lat. The east and west boundaries being lines drawn through Prince Albert and The Pas.

ONTARIO:

Mr. Collins—Continuation of the study of the geology and economic minerals along the route of the N. T. Ry., in the western part of the Province.

Mr. W. A. Johnston—Continuation of the mapping and geology of the Simcoe sheet.

QUEBEC:

Mr. Morley Wilson.—Continuation of the mapping and geological investigation in the western portion of Pontiac County east of Lake Temiskaming.

Mr. W. J. Wilson—Continuation of the mapping and geological investigation of the belt along the N. T. Ry., eastward from the crossing of Bell River.

Mr. O'Sullivan—Mapping and geological investigation of the belt along the N. T. Ry., from La Tuque westward.

Mr. Dresser—Study of the serpentines of the Eastern Townships, with special reference to the mode of occurrence in them of the valuable deposits of chrome iron ore, asbestos and copper.

NEW BRUNSWICK:

Dr. Ells—Continuation of the revision of the geology of Southern New Brunswick.

Mr. Robert—Continuation of the mapping and geology in the environments of the City of St John.

NOVA SCOTIA:

Mr. Fletcher—Continuation of the mapping and geological investigation in Kings, Annapolis, Digby and Cumberland Counties.

Messrs. Faribault and O'Farrell—Continuation of the mapping and geology of the gold-bearing rocks in Lunenburg and Queen's Counties.

Dr. Young—Investigation of the granites and other irruptive rocks, with special reference to the occurrence of tin and other valuable minerals.

SPECIAL WORK.

Mr. Ingall—Investigation of the copper resources of Eastern Canada.

Mr. Denis—Superintendence of the selection of samples of coal at the mines for the practical coal tests. Study of each mining centre for information to accompany the report on the tests.

Prof. Macoun—Collection of specimens illustrating the forest wealth of Canada for the new Victoria Museum.

Messrs. Willimott and McKinnon—Collection of mineral specimens for High School collections and for the Victoria Museum.

Mr. R. A. A. Johnston—Special duty of rare minerals in various localities.

Dr. Ami—Study and collection of fossils in Nova Scotia and New Brunswick to determine geological horizons.

BOOK REVIEWS

THE METALLURGY OF THE COMMON METALS—gold, silver, iron, copper, lead and zinc—by Leonard S. Austin, Professor of Metallurgy and Ore-dressing, Michigan School of Mines, first edition. Published by *The Mining and Scientific Press*, San Francisco. Price $4, postage, 16 cents; 407 pages, 6 inches by 9 1-4 inches.

This volume outlines, in a manner at once comprehensive and connected, the metallurgy of the metals mentioned in the title. It is divided into ten sections. Part I. is general. The definition and classification of ores is followed by brief, singularly lucid paragraphs on the metallurgical treatment of ores, combustion, fuels, refractory materials, sampling, preparatory treatment of ore, and thermo-chemistry as applied to metallurgy. This whole section displays a wide general acquaintance with the basic principles of metallurgy. None but a man of ripe experience could crystallize into words definitions so succinct and so informing.

Part II. deals with the general principles of roasting and with certain specific applications of those principles. To the chemistry of roasting four pages are devoted. Heap and stall roasting of lump ore are taken up, and the mechanical roasting of ores in a pulverized condition is very carefully, though of course briefly, developed. One meritorious feature of this section and, indeed, of every section of the book, is the care taken in specifying figures of capacity and costs

Parts III. and IV. cover the metallurgy of gold and silver. Instructive diagrams of the stamp mill accompany these sections. The pages describing the cyaniding of gold and silver ores have been revised and modified by Mr. F. L. Bosqui, a most eminent authority on the

process. Both parts are profusely illustrated with diagrams and photagravures. Parts V., VI., VII., VIII. and IX. take up iron, copper, lead, zinc and refining, respectively. In each of them the practical is wedded to the theoretical. Perhaps the most valuable section is Part X., which is headed "Commercial." In logical sequence the various steps in the establishing of a metallurgical industry are taken up, from location of works to the marketing of ores and metals.

We have read Professor Austin's volume, not only with interest, but with decided pleasure. So skilfully has the kernel of each subject been extracted, and so simple and comprehensive is the author's presentation of each, that it is impossible not to feel instructed and edified after a perusal of this excellent though unpretentious book.

CORRESPONDENCE

Bruce Mines, Ont., June 8th, 1907.

The Editor THE CANADIAN MINING JOURNAL,
Toronto.

In your June number the article entitled "Reciprocity" appeals to the writer forcibly, and for the benefit of those who may fall into similar errors it may be of interest to place on record how easily mistakes can be made in the treatment of ores, especially those of an auriferous nature, which, in appearance, are similar to those from which former experience has been acquired, and yet when put to the test of milling the result is entirely different. The writer having erected two stamp mills in South America, and made a very good recovery by battery and plate amalgamation, afterwards in Australia handling ore which was cyanided after being stamped, had the management of a considerable area in the Philippine Islands placed in his charge—this was in 1893-96, before the American war.

After making several hundred fire assays, development work was commenced, and samples taken every week across each heading, a quantity equal to two pounds weight of ore being broken for each foot in width; after a little practice this was done very fairly, and, there not being any gouge, the samples were representative. After drying the ore, it was ground by hand on an Indian rubbing stone by means of another stone. The ore was washed in a "batea"—the native wooden pan—by an expert panner, and the resultant gold fused into a small bead in the half of a species of sea shell; this was done by means of a a bamboo blowpipe on a few bits of charcoal. The lime in the shell acted as a flue, and the resultant bead was about 820 fine. In those days we could not get any acids carried by the coasting steamers, hence parting the gold was out of the question.

A continuous series of samples, aggregating two tons, showed rather more than $15 per ton, and there was present some pyrites which carried good values.

Now having a three-quarter ounce proposition of apparently free milling ore, it was considered safe to erect a ten stamp mill, and we proceeded to select a site where the tailings could be accumulated for future treatment. I will not dwell upon the difficulties of handling the machinery and erecting it, but it was done, and a mill man sent from the United States, who had been in charge of the Father de Swet Mill at Homestake, S.D., but do what we would, or could, the recovery in the battteries and on the plates did not average more than $2.75. We put in blanket strakes and saved concentrates going from 5 to 15 ounces of gold.

After making a most careful examination of everything, we came to the conclusion that whilst the abrasive action of the grinding by hand liberated the gold so that it could be saved in panning, the pounding action of the stamps flattened the gold, and it was carried off by the water without coming in contact with the amalgamated surfaces, and this in spite of mercury traps, etc. Ever since this experience the writer has been very chary of advocating stamp mills not followed by cyanide.

To add to his annoyance a report was circulated, and finally reached the ears of the managing director, resident in Manila, that the gold had been recovered but stolen! Fortunately, mill records had been carefully kept, and all amalgam weighed and the gold smelted and weighed in the presence of two or more of the white employes.

Now, how this may be applied to the present day is evident. Much of the ore to be treated from the new discoveries of Larder Lake, etc., cause the same disappointment, and perhaps this warning will be of service to those who are loking forward to results based upon assays, and the opinion of the writer may be taken for what it is worth, viz., that in many instances, especially for friable ores, the improved Huntingdon mill, or any other type in which grinding or abrasive action as opposed to stamping, will yield better results for those working on a small scale who wish to get quick returns with a minimum of expenditure. It should be remembered that the primitive form of the arrastra has produced many million dollars worth of bullion.

Yours obediently,

H. J. CARNEGIE WILLIAMS.

EXCHANGES

The Mining Investor, June 3rd, contains a caustic letter from "Critic."

The British Columbia Mining Record for April is, as usual, entirely readable and reliable.

The Coal Trade Journal, May 29th, announces that it has removed its offices to Nos. 20, 22 and 24 Vesey street, New York.

The Mining and Scientific Press, May 25th, gives a third instalment of "Letters of a Self-Made Miner to His New Foreman."

The Mining World, June 1st, gives a sketch of the oil fields of Colorado. The second installment of "British Columbia Placers: Past and Present" makes most interesting reading.

The Engineering Magazine for June contains several articles dealing with power and production. The system of mining low grade copper ores in the Boundary District, B.C., is described by Mr. Frederick Keffer, president of the Canadian Mining Institute.

The April number of *Economic Geology* has been received. In it are a number of most valuable articles. Especial mention may be made of the following: "The Composition of Coals," "Magmatic Emanations," and "Recent Improvements in the Utilization of Coal."

In *The Engineering and Mining Journal* for June 1st are articles on "Zinc Oxide and Zinc Lead Pigment Manufacture," and on the "Novel Equipment of Tywarnhaite Copper Mine." The latter paper describes an installation of dynamos driven by power from producer gas engines and the vacuum process of concentrating low grade copper ore.

The Industrial Advocate, May, prints a letter from Mr. Louis N. Fuller, general manager of the Dominion Mining & Smelting Company, of Pictou, N.S. Mr. Fuller rightly urges the claims of his enterprise for Government help in the direction of low freight rates. Each number of the *Advocate* contains valuable information corncerning the gold mines of Nova Scotia.

The Colliery Gaurdian, May 24th, in concluding a strong editorial touching the "Report of the Eight-Hour Day Committee," characterizes the movement as "but one phase of that rather selfish class individualism which has always been a characteristic feature of the coal miners of Great Britain." This issue contains also a second instalment of a paper on "Coal Analysis from the Commercial Point of View."

The Mining Journal (London), May 25th, comments editorially upon the recently issued annual report of the Nova Scotian Department of Mines. Of gold mining in that Province The Mining Journal justly remarks: "On the other hand, gold mining has been in progress since the early sixties, yet the rate of production is less than that which the small community of Australian settlers in New Guinea have reached in a few years. The report, even making allowance for inadequate resources, is certainly not an encouragement to outside capital, as it should surely be possible to collect similar returns from all sources, collate them and present complete and harmonious figures for such data as are afforded to the public." We need add nothing to our contemporary's criticism. It is, unfortunately, as true as it is incisive.

The Iron and Coal Trades Review for May 24th contains a translation of an article from Glückauf entitled "Judging Coke from its Appearance. The difference in the structure of coke made from various coal and under different conditions is well illustrated by means of photographs. Incidentally, a photograph of a speciment labelled "Metallic coke from unwashed coal produced in Canada" appears in the course of the article. It is credited with 38.48 per cent. ash, and the text explains that this coke comes from Sydney, Cape Breton, where it is used with entire success. Of course, this is utterly incorrect. There is no Nova Scotian coke that contains anything approximateing the absurd figures given in the matter of ash. Such a fuel, indeed, would be a commercial impossibility. The Sydney coke, on the other hand, rarely exceeds 10 per cent. in ash content, and is usually below that figure. We have mentioned this at some length, because a totally wrong impression is unintentionally given by the writer of the article referred to.

SPECIAL CORRESPONDENCE

Nova Scotia.

In common with the rest of the Dominion, Cape Breton has experienced a very backward spring, and the month of May was remarkable for the exceptional ice conditions that have prevailed in the Gulf of St. Lawrence, the Cabot Straits, and along the shores of Cape Breton. The drift ice is stated to have been heavier than at any time during the past thirty years, and both Louisburg and Sydney have been blocked for days together; in fact, Sydney Harbor was full of ice on the 3rd of June. In consequence, the shipments of the Dominion Coal Company have been much restricted, being almost 70,000 tons behind the corresponding month of 1906. The mines, however, did not lose any time from this cause. The output and shipments for May this year are approximately as follows, the corresponding figures for 1906 being also given.

Output and shipments for the month of May (approximate):—

Output.	1907. Tons.	1906. Tons.
No. 1	47,314	49,778
No. 2	57,592	52,186
No. 3	34,380	33,291
No. 4	41,538	50,761
No. 5	70,031	55,686
No. 6	18,362	7,859
No. 7	.....	15,024
No. 8	22,090	22,761
No. 9	34,964	36,431
	326,271	323,777

Shipments, 1907, 284,330 tons; 1906, 357,509 tons.

Glace Bay.

The Emery Seam, containing 4 feet 2 inches of good clear coal, underlaid by 5 inches of fire-clay, has been proved by a Calyx drill hole put down by the Dominion Coal Company on their property near No. 6 Mine at Big Glace Bay. The seam was met with at a depth from the surface of 222 feet. A previous borehole in this neighborhood was sunk in the near vicinity of a small dislocation, and did not show the exact thickness of the seam, as proved at other points. The present section shows the continuity of the measures under Big Glace Bay Pond, and there can be no doubt that the Emery Seam will prove a good second to the Phalen Seam at all of the Coal Company's mines. In all probability it will become entirely a longwall seam, and has a future before it.

Quebec.

An engineer who has just returned from a visit to the Eastern Townships, speaks in very glowing terms not only of the gratifying results attending the operation of the established mines, of which the general public hears litttle or nothing, but of the great potentialities of the section as a copper-producing area. Last year no less a sum than, in round figures, a million and a half dollars, was distributed in dividends, this representing the profits of five properties only. Of these mines, two are producing copper, the ore averaging perhaps $30 a ton for all values. The Nichols Chemical Company utilize their ores primarily for the manufacture of sulphuric acid, of which a large and increasing production is made; while another concern, the Eustis Company, is earning very handsome returns on the shipment of copper ore, carrying also fair gold and silver values. There is probably no district in Canada where, having regard to the capital originally invested, so good a showing has been made as in the Eastern Townships.

A press despatch announces the sale of the Eagle Mining Company's Golconda Mine, situated at Ascot, near Little Magog Lake, to a New York syndicate, for $60,000.

The Shawinigan Water & Power Company's transmission line from Shawinigan to Thetford, a distance of 97 miles, has been completed, and was recently carried to Black Lake, six miles distant from Thetford. It is now proposed to extend the line to Chrysotile. The first mine in the district to use electric power

was the American Asbestos Company at Black Lake, at whose property a plant was installed towards the close of 1904, and power supplied by the St. Francis Electric Power Company. Both the Bell Company and Messrs. King Bros.' mills are operated by electricity, and the Beaver Asbestos Company's property is now being equipped with an electric plant. It is anticipated that a majority of the asbestos and chrome iron mines of the district will utilize electricity for power requirements in the near future.

A small experimental plant has been installed by Mr. Kerr, of Boston, at one of the properties owned by the Black Lake Chrome & Asbestos Company, near Coleraine Sttation. A larger plant, it is expected, will be provided later, development having satisfactorily demonstrated the potentialities of the area.

At the mine and mill near Chrysotile some thirty men are employed under the direction of Mr. John Penhale. This property has meanwhile been acquired by Providence, R.I., manufacturers.

The foundations for the large 300 ton mill, in course of erection at the property of the Dominion Asbestos Company at Black Lake, are now in place, and it is expected that the mill itself will be completed in readiness for operation before October next.

The Dominion Asbestos Company has acquired from the Standard Asbestos Company some two hundred and seventy-five acres of valuable asbestos-bearing territory.

At the Standard Asbestos Company's property eighty men are employed in and about the mine and mill; and recently a new cyclone pulverizer and ore dryer was installed to provide for an increased production of mill fibre.

Production of crude asbestos is being made from the Manhattan and the Montreal and Glasgow Mines, which have been purchased by the American Asbestos Company. The milling material is being treated in the large mill erected by the company some years ago. Meanwhile the Montreal and Glasgow Company's old mill is being dismantled. This mill is of historic interest, as it was the first to be built in the district for the mechanical separation of asbestos.

All the big mines at Thetford, the Johnson, Bell, King's and Beaver, are being worked to full capacity; and some new, rich ground has been unexpectedly opened up at the Bell asbestos mine, while driving the incline tunnel to connect the mill with the big quarry.

Considerable activity is expected to be shown in the near future in the East Broughton district, where recently a number of promising properties have been acquired by companies. Among others, the property adjoining that owned by the Quebec Asbestos Company on the east, has been purchased by the Frontenac Asbestos Company, who purpose shortly erecting a mill thereon.

New rich territory is reported to have been opened up on the Quebec Asbestos Company's mine, while the asbestos fibre now being produced is of excellent quality.

The additions and improvements to the Broughton Asbestos Company's milling plant are now about completed, and when operations commence production should be at least twice as great as formerly.

The asbestos area between the Quebec Asbestos and the Broughton Asbestos Company's mines has been acquired by a Mr. P. Augers and associates, who are erecting a mill designed to treat 250 tons of rock per day. The machinery is to be in readiness for the commencement of operations by September next.

Cobalt.

Professor Mickle is in town, and, with the inspectors, is arranging the summer work. It is the purpose to confine their attention at the present to the Montreal River district. A recorder's office has been opened in Latchford, with Professor A. McPhail, of the School of Mines, Kingston, in charge. An assay office will be opened in connection, for the convenience of the mining inspectors.

The firm of Evans & Laidlaw, mining engineers and assayers, Cobalt, have opened offices at Latchford and Larder Lake.

Since the snow has gone and trenching in earnest has begun, almost every day new finds are reported. Last week one of the largest veins in the camp was uncovered on the Nipissing, from which a nugget weighing over seven hundred pounds was taken.

The same vein has also been traced into the McKinley-Darragh property.

The Buffalo has uncovered some more high grade veins.

Work is progressing rapidly on the Peterson Lake property. It is the intention of this company to lower the lake some fifteen feet, and, as it is very shallow, a great deal of rock will thus become exposed. Already a number of veins have been uncovered on the shore allowance.

Professor Miller is in town, accompanied by Mr. Cyril Knight, geologist. They intend to devote their attention to geology of the Montreal River district, while Professor Brock, of Queen's University, will work out the rock formation in the Larder Lake region.

BRITISH COLUMBIA.

Atlin.

Atlin miners are much incensed at J. M. Ruffner, manager of the Pine Creek Power Company and the North Columbia Gold Mining Company, two district compaines jointly operated, for bringing in Japanese. Mr. Ruffner insists that he could not obtain sufficient white labor, so had to employ Japanese. Several meetings have been held, with the result that it has been determined to form a Miners' Protective Association, with the following objects: To oppose the invasion of the camp by Japanese; to induce white men to decline to work for any company employing Japanese, and to help those caused hardship thereby; and to so influence all dealers and merchants as to prevent them from catering for the trade of any company so long as it shall employ Japanese.

The suits of the Pine Creek Flume Company against the Pine Creek Power Company, and North Columbia Gold Mining Company, respectively, relative to the right to enter upon and work claims of an area of 36 acres, are now before the British columbia courts.

Information has been received from Paris to the effect that the Otter Hydraulic Gold Mines Company had been formed in that city for the purpose of hydraulic mining on Otter Creek. It is stated locally that the ground to be worked covers five miles, and is situated in the neighborhood of Otter Creek and Surprise Lake.

East Kootenay.

Work has been resumed at the Crow's Nest Pass collieries. The number of miners is not yet nearly sufficient for the increasing demands for coal, but efforts are being made to secure more for both collieries of the Crow's Nest Pass Company, viz., at Coal Creek and Michel. Coke is again being shipped to Kootenay and Boundary smelters, which will soon be in receipt of plenty to keep them going at full capacity.

A new mine is being opened up between Coal Creek and Fernie by the Crow's Nest Pass Coal Company, which is also giving attention to the cannel coal also occurring near Coal Creek.

At both lead-silver mines—the St. Eugene and Sullivan—operations are being continued with vigor, and a large output of ore is being maintained. At the St. Eugene particularly there is much activity, with increasingly large bodies of ore being developed to induce the Consolidated Mining & Smelting Company, owning this big lead-silver mine, to enlarge its production.

ROSSLAND.

After lengthy negotiations looking to that end, an amalgamation of the Giant and California interests has been effected, and the recently incorporated Giant-California Mining Company has commenced operations under the direction of Mr. W. Yolen Williams, who, prior to devoting all his time and energies to the opening up of the Granby Company's big mines at Phoenix, Boundary district, had the supervision of the work done on the California mine, which is situated west of mines of the Le Roi and Le Roi No. 2 Companies, which, during the last year or two, have been so successfully operated in Rossland camp. When the Giant was being worked several years ago, some 4,300 tons of ore were shipped from it, so that the value of its ore in bulk is known. The ore showings in both mines are good, so it is believed the new enterprise will be successful, especially under the conditions that it has ore bodies believed from experience to be payable, and the equally important essential of competent and careful management.

The installation of the big hoist has been completed at the Centre Star mine, and the group of which this mine is the centre is at last furnished with ample hoisting facilities. The hoist is a Nordberg 1,150 horse-power engine, having cylinders 28 x 60, drums 10 feet diameter x 5 foot face, and capacity 1,350 tons in ten hours from a depth of 3,000 feet, using 4 1-2 ton skips in balance. Ordinary speed when hoisting is 2,500 feet per minute. Brakes, reversing gear and clutches are operated by auxiliary engines. Corliss valve is controlled by a governor. Hoisting cable is of 1 1-4 inch steel. The engine is set on massive cement-concrete foundations, and is housed in a frame building 53 x 56 feet, erected for its protection.

BOUNDARY.

The output of ore from Boundary district mines during the month of April totalled 117,907 tons, in the following proportions:—

	Tons.
Granby Company's mines	70,518
British Columbia Copper Company's mines	22,890
Dominion Copper Company's mines	13,289
Snowshoe mine	11,030
Small high grade mines	180
Total	117,907

The average tonnage for four months of 1907 to April 30th, inclusive, is as under:—

Month.	Tons.
January	60,003
February	53,965
March	100,219
April	117,907
Total	332,094

The West Kootenay Power & Light Company, with head office in Rossland, has purchased the hydro-electric plant and other assets of the Cascade Water Power & Light Company. The former company has for years been engaged in generating electric power at Lower Bonnington Falls, on the Kootenay River, eleven miles below Nelson, and has supplied power and light to the Towns of Nelson and Rossland, and to mines and smelters in the Nelson and Trail Creek districts. The Cascade Company has made developing power for four or five years at Cascade, on Kettle River, and has supplied power and light to several Boundary district towns, mines and the Granby smelter at Grand Forks. Last year the West Kootenay Company commenced to carry out contracts it had succeeded in making in the Boundary with some of the larger users of electric power, viz., the smelters, but failed to obtain legislative sanction to its action in entering territory the exclusive right to operate in which had been granted to the Cascade Company. As the West Kootenay Company, now that its new generating station at Upper Bonnington Falls is completed, is in a position to supply much more power than is at present required, while the Cascade Company at times had difficulty in meeting district requirements, the purchase lately concluded appears to have been in the best interests of both the companies concerned and the district at large.

COAST.

Dr. Porter, Professor of Mining, and Dr. Stansfield, Professor of Metallurgy at McGill University, accompanied by some of the students of the McGill Summer Mining School, which had just completed a field course in the Kootenay and Boundary districts, arrived in Victoria on May 24th on a few days' visit to the capital. Dr. Stansfield took advantage of the opportunity to go up to Ladysmith and look over the Tyee Copper Company's copper smelter there. He was shown around by the superintendent, Mr. W. J. Watson, a former McGill student.

Mr. R. R. Hedley has been in Victoria conferring with the Provincial Mineralogist, Mr. W. F. Robertson, as to the most effective method of gathering information concerning the mining and smelting industries of the West, in furtherance of the plan of the Dominion Department of Mines to obtain for publication reliable data relative to mines, mills, smelters etc. It is stated that Mr. Hedley is to collect the required information in British Columbia, Alberta, Saskatchewan and Manitoba. This work is an undertaking involving a considerable amount of time and trouble, as will be realized more fully before much progress with it shall have been made. Its great practical usefulness is, thaugh, ample warrant for its having been authorized.

GENERAL MINING NEWS

NOVA SCOTIA.

During the investigation of the miners' trouble at Springhill, N.S., a question arose as to the application of the Lemieux Act, to a subsidiary branch of the mine operations in which only six men are employed, and the Minister was asked for an interpretation of the law as applicable to the case. The Hon. Mr. Lemiux replied as follows: "My understanding of the intention of section 21, of Industrial Disputes Investigation Act, is of the numbers of employes directly or indirectly affected by a dispute is ten or more, the dispute may be referred to a board, though the persons to whom it may directly relate are fewer in number than ten. If the failure to effect a settlement in regard to a matter affecting directly only six men is likely to result in ten or more being either immediately or subsequently affected, the reference of such a dispute would, in my opinion, come very properly within the provision of the Act."

It is reported that negotiations are in progress for the sale of the Nova Scotia's Stteel & Coal Company's general stores and dwelling houses at Sydney Mines to a local syndicate. The value of the property is roughly estimated at half a million dollars.

Iron ore mining at Torbrook, Annapolis County, is very active. Mr. F. Burrows, the local manager, is beginning to sink the new shaft on the Martin Farm, and is conducting railway construction work.

Coal shipments from Cape Breton collieries to Montreal are already 100,000 tons short of what they were this time last year. This amount can hardly be made up before winter sets in again.

The Dominion Iron & Steel Company created a new record in the matter of blast furnace output for the month of May. The month's total output of pig iron from the three stacks now in blast totalled 28,128 tons, as against the previous record of 23,003 tons.

The first exportation of copper matte in the history of the Maritime Provinces was made on May 20th from the Pictou smelter. Twenty-five thousand and sixty-three pounds were shipped tto New York.

Sydney Mines, May 30th.—On account of the extraordinary ice conditions prevailing in North Sydney Harbor, the collieries of the Nova Scotia Steel & Coal Company are temporarily closed. This put 2,500 men out of work. About 100,000 tons of coal are banked ready for shipment.

The Maritime Coal, Railway & Power Company have acquired the property of the Canada Coal & Railway Company in Cumberland County.

Sphinghill.—On May 30th the Conciliation Board met in Truro. Mr. Archibald represented the Cumberland Coal & Railway Company. Mr. Justice Graham was chairman. Two questions were up for settlement. On one of these the board agreed, deciding in favor of the men. No agreement could be reached on the second point by the three arbitrators. The session was therefore postponed until June 27th. The point gained by the men had to do with the pay of workers at counter level crossings on No. 14 chute. The rate of pay was raised from $1.23 per day to $2.44. The second point hinges upon the men's claim of 4 cents for areas of an inch by a yard. The chairman held that in 1894 an agreement was made for 2 cents a box, and that this is still binding. Each of the three members of the board holds a different view.

Ontario.

Operations on Loon Lake Iron Mines are soon to be commenced.

At the O'Brien Mine, Cobalt, two men were killed by an explosion of dynamite on June 3rd.

The Algoma Steel Company announces that it will commence at once the erection of a large blast furnace. The furnace is to cost $1,000,000, and will be the largest in Canada. Coke ovens will also be erected. The building of a new furnace has become essential because of the high price of American pig iron.

The Mining Recorder's Office for the Montreal River Division was opened on May 30th. Mr. Alex. McPhail is in charge.

An air compressor is being installed at the Government workings on the Gilies Limit.

In a south cross-cut, at a point 250 feet southwest from the original 49 strike, a new vein, rich in silver, has been discovered on the Nipissing.

The Evans Mine is making a shipment of cobalt ore to Wales. A French syndicate controls a reduction plant there.

On Monday, May 26th, a prospector named Peter Leclair was killed by the T. & N. O. yard engine at Cobalt.

The Rat Portage Diamond Drill Company have commenced drilling on the Hamilton property at Stobie Falls.

The Clover Leaf Copper Mine, near Grassy Lake, in the Larder Lake District, is owned by a Pennsylvania syndicate. It has produced about 150 tons of fair ore. The ore has never been shipped. Adjoining this property a Toronto syndicate has purchased a number of claims and will operate them this summer.

The Gamey property of 40 acres, near the Coniagas Mine, has been purchased by the Cobalt Central Mining Company.

Alberta.

A Commission has been appointed to investigate the car shortage and to inquire into the conditions existing among the coal miners of the Province. The Commission consists of the Hon. A. L. Sifton, Chief Justice of the Supreme Court, chairman; Mr. Louis Stockett, manager of the Bankhead coal mines, and Mr. Hansom, a working miner, belonging to Coleman. Sittings will be held in all the leading coal mining centres of the Province.

The coal mine operators of Bankhead have advanced the price of coal at the mines by 15 per cent. This is rendered necessary, they claim, by the advanced rates of miners' pay.

Mr. Chas. P. Hill, manager of the Hillcrest Coal Mine at Hillcrest, Alberta, refused to sign an agreement taking back into his employ the striking miners. Mr. Hill claims that the new wage schedule leaves him absolutely no room for profit.

In Edmonton rumors are still flying around concerning the discovery of gold in the Yellowhead Pass of the Rocky Mountains.

The miners employed by the Alberta Railway & Coal Company have made application to the Federal authorities for the appointment of a board of investigation and conciliation to enquire into alleged grievances, which are stated to be the general condition of employment, wages and hours of work. The Minister of Labor has consented to appoint a board, and the company has been notified to name its representatives.

British Columbia.

On the Rose Gulch Hydraulic Company's property, adjoining the Cariboo Consolidated, in Cariboo District, newly discovered ground breasts out fully six feet of pay dirt, with a width of 75 feet. One monitor only is at work on the new property.

The Rambler-Cariboo Mine will begin shipping ore in the first week of June. Ore has not yet been struck on the 1,400 foot level.

The Bowen Island Copper Company has sunk a prospecting shaft, 60 feet, in what appears to be a strong, true fissure vein, containing a good grade of chalcopyrite. A drift has been run 50 feet on the lead. A working shaft will now be sunk. This property is within twenty miles of the City of Vancouver.

The British Columbia Copper Company, Greenwood, was able to tide over the coke shortage of last month. Superintendent McIntosh has now about 200 men employed at the Mother Lode, in Deadwood Camp. The new crusher for this company's mine at Oro Denoro is being installed.

The Tip Top Mine, east of Greenwood, has been purchased at a cash price, reported to be about $10,000.

Dr. J. Bonsall Porter, with a large party of McGill mining students, has visited the principal mining camps of British Columbia. Many of the students will remain here for the summer. They have secured temporary positions.

The Sullivan Group Mining Company, Kimberly B.C., with mines at Kimberly and a 125 ton smelter at Marysville, seven miles distant from the mine, owns and operates the Heberlin process for roasting ore before smelting. The smelter capacity is soon to be increased to 150 tons daily. During April the smelter turned out 521 tons of bullion, worth $50,000.

A new ten drill air compressor has been started at the Ymir Mine.

The demand for coal continues to be far in excess of the supply at the Vancouver Island and Puget Sonud coal mines.

Boundary District miners, smelter men and laborers have been given substantial raises in pay. All underground men get a fifty cent raise. Surface men will get 10 per cent. increase on present pay. Smelter day laborers will receive $3 per day of nine hours. In other departments an increase of from 25 to 50 cents is granted.

Suit has been brought against F. Augustus Heinze by the Canadian Pacific Railway. Mr. Heinze owns 600,000 acres of timber lands and coal fields in British Columbia. The C. P. R. is trying to compel Mr. Heinze to take title of his land in order that the railroad may then proceed with the development of other properties after Mr. Heinze has definitely designated the exact boundaries of his own.

The Golden Eagle Mine is reported to have been sold to a Vancouver syndicate for $60,000. The Golden Eagle is in the North Fork district and was originally owned by Christopher Tobiason. Five years ago an English syndicate took a bond of the property for $75,000, but the bond lapsed.

Mr. D. R. Irving left Victoria on May 18th to take charge of the operations of the Berry Creek Hydraulic Mining Company.

The extensive iron ore deposits of Texada Island are to be reopened. Mr. James A. Moore, of Seattle, is behind the movement. The ore is to be shipped from Gillies' Bay, where a deep-water wharf is being built, to the Irondale smelter on Puget Sound.

On May 22nd a large seam of coal was discovered near Wellington. The seam is seven feet deep.

Hydraulicking was commenced near Barkerville, Cariboo, on May 4th.

At No. 4 Mine, one of the largest of the Wellington Colliery Company's mines at Union, B.C., a serious fire broke out on June 1st. The mine, which employs about 700 miners, will have to be flooded. The mine is approached by a slope.

YUKON.

Mr. A. J. Beaudette, Territorial Engineer for the Yukon, in a report gives the following particulars and costs of thawing ground for dredging operations on Bonanza Creek:—Wood used per 24 hours, 5 1-2 cords; cost of wood per cord, $13.50; labor, 2 shifts, 3 men per shift, $40; cubic yards thawed per 24 hours, 400; cost per cubic yard for thawing, 28.5 cents. Notwithstanding this substantial addition to dredging costs in the Yukon, due to the frozen condition of the gravel throughout the season, dredging operations in the Territory have so far yielded fair returns.

Catalogues and Other Publications Received

The Allis-Chalmers-Bullock's Bulletin No. 201 deals with "Lidgerwood Hoisting Engines for Mining Purposes."

The catalogue of R. H. Buchanan & Company, 234 Craig street west, Montreal, has been received. This firm makes a specialty of pumps and pumping machinery. They handle the Pulsometer steam pumps and the Rider-Ericsson hot air pumping engines.

An attractive catalogue, received from the Cleveland Car Company, West Park, Ohio, presents much information and many illustrations pertaining to industrial and narrow gauge railway equipment. Many designs in trunnion, two-way, bottom, end, one-side, either-side, rotary and other varieties of dump cars are manufactured by this firm.

Bulletins 741, 756, 703, 103, 106, 712, have been received from the Jenckes Machine Company, Limited, Sherbrooke, Que. In these the Jenckes Company's hoisting engines, standard iron cars, "special cableway" engines, vertical tubular boilers, locomotive type boilers and "special" hoisting engines are illustrated and described. Their hoisting engines are of especial interest.

Surveying and Other Instruments of Precision (semi-centennial edition, 1857-1907), issued by Hearn & Harrison, opticians, 10-12 Notre Dame street east, Montreal. This catalogue illustrates and describes the microscopes, telescopes, hydrometers, thermometers, hygrometers, surveying, meteorological and nautical instruments, drawing instruments and accessories manufactured and imported by this celebrated firm.

Catalogue G, from the Blaisdell Company, engineers and manufacturers, 334 Pacific Electric Building, Los Angeles, California; New York office, 2600 Park Row Building, describes the Blaisdell Pressure Filter. This filter is devised for dewatering mill pulp and separating cyanide solution and wash water from the slime. It consists of three parts; a series of filter leaves; a pressure cylinder, and pumps for vacuum, slime, water and solution, with pipes and valves. The process is continuous. One operator on each shift can control one or more filters and handle a large tonnage. Skilled labor is unnecessary, owing to the simplicity of the installation. The filter is adapated to any variety of slime. The various sizes range in capacity from 12 tons of dry slime per day to 500 tons per day. The manufacturers invite prospective purhcasers to send 50 pound sample of dry slimes for testing at their plant, with a view to ascertaining their requirements.

From the Power & Mining Machinery Company, Cudahy, Wisconsin, have been received a number of catalogues and pamphlets. In their catalogue No. 5 there is presented a description of gold and silver milling machinery. A very useful set of general specifications for a ten-stamp gold mill is given on pages 73-75. Catalogue No. 6 deals with "Roasting, Smelting and Refining." The first part of the catalogue takes up the "Preparation of Ores for the Smelter." Then follow descriptions of the standard machinery, furnaces and complete equipment used in roasting, smelting and refining for the recovery of precious metals. Gas power plants are also handled by this firm. In the same catalogue the American-Crossby Suction Producer Plant is described. It is recommended for requirements up to 500 horse-power, where charcoal, coke or anthracite pea coal may be purchased at reasonable figures. For powers of 500 horse-power and greater, the Loomis-Pettibone Gas Generating System in connection with gas engines is recommended.

PERSONAL AND GENERAL

Mr. N. Timmins, of Cobalt, was in Sudbury during the latter part of May.

Mr. B. F. Pearson, of Halifax, N.S., one of the chief promoters of the North Atlantic Collieries Company, spent a few days in Toronto recently.

Mr. W. Stanley Lecky, head of Messrs. Mussens, Limited, mining machinery department, has returned to Montreal after an absence of some weeks in England.

Mr. W. Yolen Williams, formerly mine manager for the Granby Company at Phoenix, has been appointed superintendent of the Giant-California Company, Rossland, B.C.

Mr. J. A. Dresser has been retained by the Director of the Geological Survey to do special geological work for the Department this season in the Eastern Townships.

Mr. A. P. Low, Director of the Geological Survey of Canada, has been appointed Deputy Minister of Mines. Mr. Low will retain the former post in addition to his new duties.

Mr. A. A. Hassan, mining geologist and consulting engineer, is making the King Edward Hotel, Toronto, his temporary headquarters while engaged in examining various districts around and near Cobalt.

The imports of nickel in ore and matte to the United States in 1906 were 15,156 tons, containing approximately 18,500,000 pounds of metallic nickel, valued at $1,816,631. These figures show a material increase over the returns for 1905.

Mr. Erik Nystrom, of the staff of the Mines Branch, has received instructions to investigate the peat industries of Holland, Norway, Sweden, Denmark, Finland and Germany, and prepare a full report on the subject for the Department. He sails for Europe immediately.

The forty-sixth general meeting of the Institution of Mining Engineers will be held in London on June 13th and 14th. We note that Mr. J. B. Tyrrell's paper on "Development of Placer Gold Mining in the Klondike District, Canada," will be open for discussion.

Dr. J. Bonsall Porter returned to Montreal on the 2nd inst. after an absence of some weeks in the West in charge of the annual McGill summer mining excursion. The excursion was an exceptionally successful one, visits being paid to Cobalt, Lethbridge, Frank, and the several mining districts of British Columbia.

Mr. A. A. Hayward, at one time manager of the famous Golden Lode Mine in Nova Scotia, and a past president of the Nova Scotia Mining Society, paid a visit to Toronto early in June. Mr. Hayward is a mine manager with an excellent record behind him. It is probable that he will make Toronto his permanent residence.

One of the recipients of the Carnegie Research Scholarships awarded recently by the Council of the Iron & Steel Institute, is Mr. C. A. Edwards, a Canadian by birth, who, however, gained his experience of foundry practice at Horwich, England, at the works of the Lancashire & Yorkshire Railway. Mr. Edwards is joint author of the Eighth Report to the Alloys Research Committee, and was recently appointed Research Fellow and Demonstrator in the Metallurgical Department of the University of Manchester, under Professor Carpenter.

STATISTICS AND RETURNS

Cobalt ore shipments for the week ending June 1st, 1907:—

	Pounds.
May 27th—O'Brien Mine, to Perth Amboy, N.J.	65,200
May 27th—Coniagas Mine to Perth Amboy, N.J.	54,300
May 28th—Coniagas Mine to Perth Amboy, N.J.	63,000
May 30th—Coniagas Mine to Perth Amboy, N.J.	62,000
May 27th—Nipissing Mine to New York	65,480
May 28th—Nipissing Mine to New York	64,790
May 30th—Nipissing Mine to New York	55,400
May 30th—Temiskaming and Hudson Bay Mine to Copper Cliff, Ont.	55,500
May 31st—Trethewey Mine to Perth Amboy, N.J.	63,200
	545,870

ROSSLAND ORE SHIPMENTS.

Shipments for the week ending June 1st: Centre Star, 1,960 tons; Le Roi, 2 910 tons; Le Roi No. 2, 2,455 tons; White Bear, 70 tons, milled, 350 tons. Total for the week, 5,745 tons, and for the year to date, 105,414 tons.

CROW'S NEST PASS OUTPUT.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ended May 31st was 21,504 tons, a daily average of 3,584 tons. For the corresponding week of last year the output was 20,835 tons, a daily average of 3,573 tons.

DOMINION STEEL.

It is reported that the output of the Dominion Iron & Steel Company at Sydney this season will be at the rate of 30,000 tons pig iron per month, as compared with 20,000 per month last year.

Shipments from the Springhill collieries of the Cumberland Railway & Coal Company for May amounted to 36,559 tons.

Shipments for week ending May 18th:—Centre Star, 2,185; Le Roi, 3,455; Le Roi Two, 315; White Bear, 95; White Bear (milled), 350. Total for week, 6,380, and for the year to date, 94,912. Trail smelter received 2,723 tons during the week, and Northport smelter, 3,455 tons.

Nelson, May 18.—The following are the ore shipments and smelter receipts in Southeastern British Columbia districts for the past week and year to date in tons:—

Shipments: East of Columbia River, week 2,509, year 44,785; Rossland, week 6,814, year 97,323; Boundary, week 3,620, year 370,392; total, week 12,943, year 512,500.

Smelter receipts: Grand Forks, week nil, year 207,822; Greenwood, week 3,500, year 96,777; Boundary Falls, week nil, year 94,147; Nelson, week 387, year 7,092; Trail, week 3,723, year 85,185; Northport, week 3,207, year 32,185; Marysville, week 600, year 12,000. Total, week 11,567, year 4z5,546.

BOUNDARY ORE OUTPUT.

Phoenix, May 23.—A compilation of figures regarding the ore output of the mines of the Boundary for the month was the best for more than half a year in the district, although May is falling down badly, on account of the coke shortage. Shipments from several mines of the Boundary that have been sending out ore are figured as follows, in tons:—

Granby mines		70,518
British Columbia Copper Company—		
Mother Lode	21,040	
Emma	1,470	
British Columbia Mine	40	
Morrison	340	
		22,890
Dominion Copper Company—		
Brooklyn	4,469	
Rawhide	5,024	
Sunset	2,626	
Mountain Rose	357	
Idaho	813	
		13,289
Snowshoe		11,030
Providence		110
Elkhorn		30
Strathmore		20
Duncan		20
April total		117,907

The Granby's record for April exceeded that for any month since last fall, and the British Columbia Copper Company's record is the highest in the history of the company. That of the Snowshoe, also, is a large one for that mine. As the British Columbia Copper Company is the only smelter having coke this month, the other two have been idle, and the May story will be a very small one.

The Boundary output by months, in tons, has been as follows:—

January	60,003
February	53,965
March	100,219
April	117,907
Total	332,094

WEEK'S ORE SHIPMENTS.

Week ending June 1st.

Boundary shipments—

Mine.	Week.	Year.
Granby	1,431	207,932
Mother Lode	4,520	84,217
Brooklyn	1,376	25,115
Idaho	300	1,196
Rawhide	1,275	26,756
Mountain Rose	105	1,942
Elkhorn	25	47
Other mines	.....	44,590
Total	9,032	385,795

Rossland shipments—

Mine.	Week.	Year.
Centre Star	1,608	36,142
Le Roi	1,608	54,808
Le Roi No. 2	517	9,397
White Bear	102	1,094
Other mines	.....	5,570

Kootenay-Slocan shipments—

Mine.	Week.	Year.
Sullivan	600	13,200
La Plata, milled	425	9,350
Queen, milled	185	4,070
Eva, milled	230	920
Whitewater, milled	300	750
Queen Victoria	2z7	1,858
Silver King	142	910
St. Eugene	445	6,280
La Plata	48	1,422
North Star	41	484
Silver Cup	32	407
Vancouver	42	324
Hunter V	56	2,079
Other mines	.....	8,469
Total	2,868	50,623

The total shipments from the mines in the above districts for the past week were 16,128 tons, and, for the year to date, 643,329 tons.

Week ending May 25th:—

Boundary shipments—

Mine.	Week.	Year.
Mother Lode	6,350	79,691
Solly	22	64
Other mines	.....	297,763
Total	6,372	376,763

Rossland shipments—

Mine.	Week.	Year.
Centre Star	1,447	34,534
Le Roi	3,012	52,807
Le Roi No. 2	535	8,880
White Bear, milled	350	2,200
White Bear	116	992
Other mines	.....	3,370
Total	5,460	102,783

Kootenay-Slocan shipments—

Mine.	Week.	Year.
Sullivan	600	12,600
La Plata, milled	425	8,925
Queen, milled	185	690
Whitewater, milled	300	450
Hunter V	79	2,023
Queen Victoria	126	1,561
St. Eugene	512	5,835
La Plata	54	1,374
Vancouver	41	282
Silver Cup	41	375
Payne	18	18
Whitewater Deep	64	259
North Star	164	343
Last Chance	31	325
Other mines	.....	7,710
Total	2,870	47,655

The total shipments for the mines in the above districts for the past week were 14,702 tons, and for the year to date 527,201 tons.

RAND GOLD OUTPUT.

The output of gold from the Transvaal mines in May, as estimated by Kaffir houses in London, was 500,000 ounces fine. This represents a decrease of 37,000 ounces from the April out-turn, but interference and forecast are difficult, owing to the strike in the Rand.

The value of the May output, roughly, is $10,625,000, as compared with $11,405,550 in April, $11,684,860 in December, the record month, and $9,795,310 in May a year ago. If this estimate proves correct, last month's output will have been the lightest of any month since last July, when 491,793 ounces were turned out. Prior to the Boer war, the high record of Transvaal production was $8,604,000 in August, 1899.

COMPANY NOTES

Tyee Copper (B.C.).—The report for April state: Smelter ran 13 days and smelted—Tyee ore, 880 tons; Customs ore, 2,121 tons; total, 3,001 tons. Matte produced from same, 269 tons. Gross value of contents (copper, silver and gold), after deducting costs of refining and purchase of Customs ore, $7,658.

Nearly the whole of the second vein allotment of British Columbia Copper Company stock was taken up by stockholders in the ratio of 30 per cent. of holdings. In January the management increased the company's capital from $2,000,000 to $3,000,000 by an issue of 200,000 shares, par value $5 each. At the present time there are 96,640 shares of unissued stock.

Le Roi No. 2 (B.C.).—In a recent report to the London office the manager states that he is confident that he has discovered the H vein on the 900 foot level. As yet the values are not as high as they were at the 700 foot level, where they averaged 2.75 ounces gold, but the new discovery is regarded as most promising. In view of this report the shares have advanced 3-16 on the London Market.

A gigantic gain in profits for 1906, dsepite a material falling off in production of metal, was shown yesterday by the Anaconda Copper Mining Company, in its annual report. The total production was z4,963,835 pounds, or 479,895 pounds less than in 1905. The company's gross profits from its sales of copper, silver and gold, however, aggregated $20,955,532, or $3,526,434 more than sales during the previous year. Its total receipts amounted to $26,968,870, or $3,234667 more than in 1906, while its total disbursements involved $18,384,870, $238,220 more, leaving a total net income of $8,842,669, or $3,123,341 more than the net earnings for the previous year. This net income represented 29.47 per cent. earned on the company's $30,000,000 of capital stock. Dividend disbursements at the rate of 28 per cent. involved $6,000,000, or $3,450,000 more than in 1905, leaving a surplus for the year of $1,942,669, or $326,159 less than at the close of the previous year. The company's profit and loss surplus, which amounted to $9,183,241, was equivalent to 30.61 per cent. on the outstanding stock.

NEW COMPANIES

The Vancouver Coal & Prospecting Company, Limited, capital twenty thousand dollars, divided into twenty thousand shares of one dollar each; Victoria, B.C.

The Combined Goldfields, Limited, the share capital to be three million dollars, divided into three million shares of one dollar each. Head office, Toronto, Ont.

The Eastern & Cobalt Mining Company, Limited, share capital to be one million dollars, divided into one million shares of one dollar each. Head office, Cobalt, Ont.

The East Bay Larder Lake Gold Mines, Limited, share capital to be one million dollars, divided into one million shares of one dollar eeach. Head office, Toronto, Ont.

The Empire Larder Lake Gold Mines, Limited, share capital to be one million dollars, divided into one million shares of one dollar each. Head office, Toronto, Ont.

The Rush Larder Lake Mining Company, Limited, share capital to be one million dollars, divided into one million shares of one dollar each. Head office, Toronto, Ont.

The Ontario Copper Company, Limited, share capital to be three million dollars, divided into six hundred thousand shares of five dollars each. Head office, Toronto Ont.

The Martin Larder Gold Mines, Limited, the share capital of the company to be one million dollars, divided into one million shares of one dollar each. Head office, Toronto, Ont.

The Anglo-Canadian Petroleum Company, Limited, incorporated under the laws of the Imperial Parliament of Great Britain and Ireland. Capital to be used in Ontario not to exceed $250,000.

The Maple Leaf Mines, Limited, non-personal liability, capital two hundred and fifty thousand dollars, divided into two hundred and fifty thousand shares of one dollar each; Victoria, B.C.

The James Township Silver Mines, Limited, share capital to be one mililon five hundred thousand dollars, divided into one million five hundred thousand shares of one doller each. Head office, Toronto, Ont.

The Ontario Exploration Company, Limited, share capital one million dollars, to be divided into one million shares of one dollar each, of which fifty thousand shares are to be preference shares. Head office, Bracebridge, Ont.

The Portland Canal Mining & Development Company, Limited, capital one hundred thousand dollars, divided into three hundred and twenty-five thousand shares of twenty-five cents each, and fifty thousand shares of twelve and one-half cents each; Victoria, B.C.

The Lake Superior Iron & Steel Company, Limited, the share capital of the company to be one million dollars, divided into ten thousand shares of one hundred dollars each. Head office, Sault Ste. Marie, in the District of Algoma, Ont. One of the objects of this incorporation is to manufacture and deal in iron, steel, nickel, and any other ore products of the mine and products thereof. Another is to manufacture charcoal and by-products, coke and by-products, and to deal in wood and the products thereof.

The following extra-provincial companies have been registered in British Columbia:—

The Bella Coola Copper Company, Limited, capital two million dollars, in shares of one dollar each, head office Spokane.

The Jewel Syndicate, Limited, capital twenty-five thousand pounds, in shares of one pound each, head office in Scotland.

The Falls Copper Mining Company, Limited, capital one million five hundred thousand dollars, in shares of one dollar each, head office Spokane.

The Alberta Fuel Company, Limited, capital one hundred thousand dollars, in shares of one dollar each, head office Spokane, State of Washington.

The Copper Mountain Mining Company (specially limited), capital five hundred thousand dollars, in shares of one dollar each; head office, Phoenix, Arizona.

METAL, ORE AND MINERAL MARKET

Aluminium, No. 1 grade ingots—46 cents per lb.

Antimony—15 to 18 1-2 cents per lb.

Arsenic, white—7 1-2 to 7 7-8 cents per lb.

Barytes, crude—$11.25 to $14.50 per short ton.

Bismuth—$1.50 to $1.75 per lb.

Cadmium—$1.40 per lb.

Carbons, for drills—$78 to $85 per carat.

Carborundum, powdered—8 cents per lb.

Chromium, metal pure—80 cents per lb.

Cobalt, f.o.b. Cobalt, Ont., unrefined—35 to 50 cents per lb.

Corundum—7 to 7 1-2 cents per lb.

Feldspar, ground—$9.75 to $10 per short ton.

Flourspar, lump—$10 per short ton.

Graphite, domestic—$50 to $150 per short ton.

Gypsum, lump—$4.50 per long ton.

Infusorial earth, ground—$15 to $30 per ton.

Lead—5.75 cents per lb.

Manganese, pure metal—75 cents per lb.

Mica, ground—$80 per short ton.

Mica, scrap—$15 per short ton.

Molybdenum, pure—$1.70 per lb.

Molybdenite ore, 95 per cent. pure—$4.50 to $5 per unit.

Nickel—45 to 60 cents per lb.

Platinum, ordinary metal—$27 per ounce.

Pyrite, 38 per cent. to 45 per cent. sulphur, lump.

Quicksilver—$41 to $42 per 75 lb. flask.

Talc—$18 to $23 per ton.

Tungsten, pure metal—$1.25 per lb.

Tungsten ore, 60 per cent. pure—$400 per ton.

Tin—41 1-2 cents per lb.

Zinc Sheets—$8.60 per 100 lbs.

MARKET NOTES.

Northern pig iron, No. 1, ranges from $27 to $27.50. Bessemer malleable, $26 to $27.50. Bessemer ore, old range, $5. Bessemer, Mesabi, $4.75. Non-Bessemer, old range, $4.30.

Copper market is still unchanged. Lake copper, 24 1-4 to 25 cents per lb.; electrolytic, 23 to 23 1-2 cents per lb. The London market is unsettled, with a tendency towards lower prices. Standard, £99 1s. for spot.

Tin—There has been a marked fall in the price of this metal, apparently due to increased supplies. New York, 41 1-2 cents per lb; London, £187 per long ton for spot.

Lead—A decreasing demand has brought lead down to 5.75 cents per pound. The London market holds at £20.

Silver is moving upward. New York, 67 1-4 cents per ounce; London, 31d. Mexican dollars, 52 1-8 cents.

Spelter is steadier. New York, 6.47 1-2 cents per lb.; London, £24 10s. per long ton.

Cobalt, refined metal, $2.40 per lb.

The economic value of monazite lies in the incandescent properties of the oxides of the rare earths—cerium, lanthanum, didymium and thorium—which it contains. The cerium goes to the drug trade; the thorium, together with limited quantities of lanthanum and didymium, is used in the manufacture of mantles for Welsbach and other incandescent lights.

The zircon produced in 1906—all from Henderson County, N.C.—amounted at 1,100 pounds, valued at $248.

Mines and Minerals for June contains a leading article on "Montana Coal Mines." "An article on "Cobalt" is concluded from the May number.

DOBLE TANGENTIAL WATER WHEELS

Driving an air compressor to operate a mine at Lardeau, B. C. An ideal form of power for mining operations where water is available. These wheels are now in operation under heads of 25 feet up to 2,200 feet, and in capacities up to 9,000 horse power. See Bulletin No. 7.

Hydraulic and Mill Machinery, Boilers, Pumps, Water Tanks, Penstocks, Steel Rivetted Pipe. Complete Power Plants Built and Installed.

THE WORTHINGTON PRESSURE PUMP

here shown is specially designed for oil-pipe lines, mining purposes and other services requiring the delivery of liquids under heavy pressure. See Catalogue. W 30.

McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

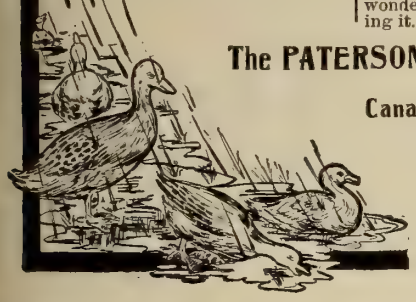
A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $200 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

THE REGISTRAR,
McGill University, Montreal.

Amatite

SHEDS WATER LIKE A DUCK'S BACK



The Mineral Surfaced Roofing

Ever heard of Amatite? Well, if you haven't we want to tell you something about it. First of all remember the name---Am a-tite.

It's worth your while because it is the real mineral surface roofing that every-one who sees buys. It's the winner in Ready-Roofings, and a vast improvement over the other styles. It's ready-to-lay---any one can do the work.

It's rainproof, wind and weather-proof---outwears all other kinds, is less expensive, and, most important --- it never requires painting or repairs.

That is a pretty broad claim, but we can back it up to the letter. But don't take our word for it. Send in your name and address to-day and we will send you the proof -- an illustrated booklet and free Sample. Once you see the roofing itself you will not wonder why everyone is buying it. Write to-day.

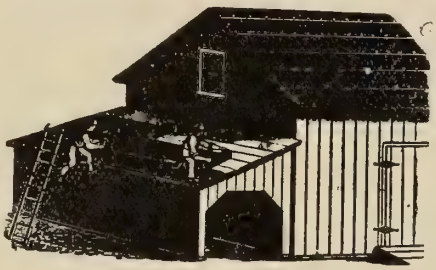
Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905. Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.



We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

Our Analyses Speak for Themselves.

R. C. DRINNEN, Superintendent.
C. C. S. LINDSEY, General Manager.

THE CANADIAN MINING JOURNAL has been favored with many enquiries, from its subscribers and others, for a reliable map of the Cobalt district. To meet this demand the Journal decided to publish a specially prepared map which would not only indicate the location of all mineral claims up to date, but would embody the latest geological data. In carrying out this design, expense was not spared. A map has been prepared in which all locations up to date of publication are indicated. The geological horizons are plainly delimited by a five colour legend. The map is issued in attractive form backed with canvas to resist wear, and folded in a shape which makes it ready of reference and easily portable in a coat pocket.

The above is a reduced reproduction in black and white. Orders for this map will be promptly filled at the office of---

The Canadian Mining Journal

Confederation Life Building - - Toronto, Ont.

PRICE OF MAP - - - $1.00 including postage.

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre ;

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions : The full price must be paid in cash ; specimens must be produced and accompanied by an affidavit ; a survey at the cost of the applicant must be made on unsurveyed lands ; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to :

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

TEMAGAMI

A Land of Lakes and Rivers

GRAND TRUNK RAILWAY SYSTEM

A Peerless Region for the Tourist, Camper, Canoeist, Angler and Sportsman

Underwood

If you use a typewriter at all, doubtless you use a visible writer—the other kind is obsolete. It may be that you have recently purchased some Underwood imitation for which strong claims were made; for instance, that the writing would remain in perfect and permanent alignment.

Everyone recognizes that the prime requisite of a typewriter is good work, and that good work necessitates accurate alignment. But no visible writer can possess this essential unless it has a guide at the printing point. The Underwood has the guide.

If you have a new Underwood-imitation, use it for six months. If it holds its alignment without the aid of the repair-man we will present you with the best typewriter made—an Underwood. Make the test; you stand to lose nothing, and—we feel quite safe.

United Typewriter Company, Limited

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Send us your name and address and we will gladly mail you one of our catalogues and put you on the list for a subsequent one. Our catalogues contain complete price lists of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for every body who has buying to do and money to spend. Write for it now so as we can have your name on the list in time.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. NEW ORE CRUSHER AT WORK

WILL CRUSH 1,500 TONS OF KNOB HILL ORE EVERY 10 HOURS.

OPERATED BY ELECTRICITY SUPPLIED BY CASCADE POWER CO.

Phoenix, Jan. 23.—(Special to The Daily News.)—This week all the electric wire connections having been made, the new ore crusher, ordered last May by the Granby company, was started in operation. It has been ready for some time and only awaited the coming of the electric current from Cascade.

The initial run of the huge machine was eminently satisfactory to superintendent Williams, who will have it operated 10 hours daily, in which time it will crush 1,500 tons of Knob Hill ore. Later another machine of the same type will probably be installed at the Old Ironsides' ore bins.

The crusher is of the Blake-Farrell type and is the largest machine of its kind in Canada. The chilled steel jaws will take a piece of rock 36x42 inches in size, more than a cubic yard, and is fitted with swing jaw and pitman. It was furnished by the Jenckes Machine company, of Sherbrooke, Que. The freight on one of the several cars in the shipment was over $2,000

To operate the crusher a 100 horse power electric motor was secured from the Canadian General Electric company.

Largest Crusher in Canada

The newspaper clipping reproduced herewith refers to a 42" x 30" Crusher built by us for the Granby Smelter at Phoenix, B.C., being the first of four similar, counting one now under construction, built for this same company. The four Crushers have a total capacity of six thousand tons of rock every ten hours. They are the largest Crushers of the Jaw type in Canada.

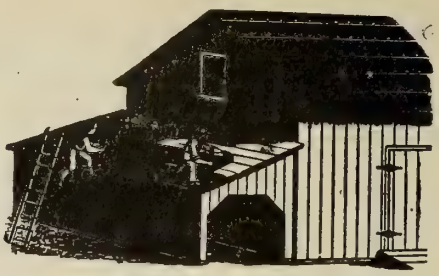
NOTHING FOR NECESSITIES—NOTHING FOR REPAIRS



When you buy Amatite everything is included in the FIRST COST.
There is no cost for EXTRAS, because nails and cement for laps are furnished free with every roll.
There is no MAINTENANCE cost, because its mineral surface makes painting and coating absolutely unnecessary.
There is no REPAIR COST, because Amatite is so constructed that it needs no attention after it is once laid on the roof.
There is no LABOR cost, because Amatite is so easy to lay that you can do the work yourself.
The first cost is the only cost—THE FINAL COST.
Amatite is the only Ready Roofing embodying every good point that a roof
Heat and cold, rain and snow, reids and chemicals do not affect it and in addition to this its mineral surface makes it one of the best fire-retardents known. It is roofing at its best.

Free Sample *A Booklet telling more about it and a Free Sample will be sent upon request. Send at once and see for yourself how much better Amatite is than the "paint me every two years or leak" roofings.*

Sole Agents for Canada: CANADIAN MINING JOURNAL, Confederation Life Bldg., Toronto

THE CANADIAN MINING JOURNAL has been favored with many enquiries, from its subscribers and others, for a reliable map of the Cobalt district. To meet this demand the Journal decided to publish a specially prepared map which would not only indicate the location of all mineral claims up to date, but would embody the latest geological data. In carrying out this design, expense was not spared. A map has been prepared in which all locations up to date of publication are indicated. The geological horizons are plainly delimited by a five colour legend. The map is issued in attractive form backed with canvas to resist wear, and folded in a shape which makes it ready of reference and easily portable in a coat pocket.

The above is a reduced reproduction in black and white. Orders for this map will be promptly filled at the office of---

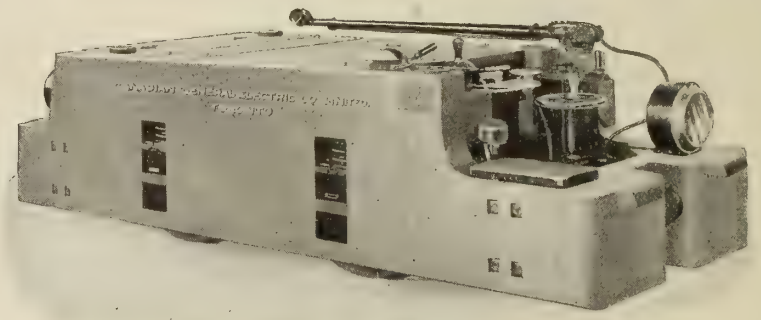
McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.



A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

COBALT LAKE

The Cobalt Lake Mining Company, whose property is described in this issue, is confronted with an engineering problem which is neither so complex nor so hopeless as is generally supposed. The ore lying under the lake bottom is to be won. Shafts are being sunk within a few feet of the east shore of the lake, and when these have attained a suitable depth, drifts will be started from them under the lake. Contrary to the expectations of many critics, no difficulty has been experienced with water. The shafts make only a few gallons per day. Surface prospecting has been proceeded with, but more attention has been paid to shaft sinking, and we have no doubt that encouraging results will reward underground development. Briefly, if the Cobalt Lake Mining Company were capitalized at a reasonable figure there would be very little cause to hold anything but a very cheerful view of its prospects. Unfortunately, it was thought necessary, in organizing the company after the purchase of the lake, to set its capital at $5,000,000. Of the stock issued a large amount went in commissions and brokerage. Large blocks were assigned to certain persons for no apparent consideration whatever. Had the capitalization included merely the purchase price and the amount actually necessary to develope the mine, Cobalt Lake would have been a most desirable proposition. As it stands to-day it is problematical, though by no means hopeless. Fortunately, a vigorous and comprehensive policy has been adopted in developing the property. No shipments have been made, because it was frankly recognized that regular shipments cannot be counted upon until a relatively large amount of preparatory work has been performed. Any other policy would spell ruin.

So far as the peculiar difficulties of mining are concerned they have been carefully studied, and, we believe, successfully attacked. But considerable as these difficulties are, they do not handicap the enterprise to the same extent as does its egregious capitalization.

Incidentally, the Ontario Government has been criticized for its share in the original sale. No doubt the Government has erred on several occasions in affairs pertaining to Cobalt. Under the circumstances it is surprising that more mistakes were not made. But we consider the Government perfectly justifiable in this transaction. It advertised Cobalt Lake as for sale to the highest bidder. To the highest bidder, complying with necessary conditions, Cobalt Lake was sold. The purchase price was not excessive, when the tremendous contemporaneous inflation of values is considered. Nor would the first cost of the property militate against its successful working had not subsequent manipulation

raised the capitalization far beyond the safe or necessary limit.

If Cobalt Lake succeeds, it will succeed in spite of the unwisdom of its promoters. If it fails the blame cannot be laid upon the Provincial Government, nor upon its sane and efficient executive.

DISSIPATION OF ENERGY

Although in the ordinary iron blast furnace we have one of the most economical forms of the utilization of the energy stored up in coal, still even in its operation there are many very serious losses of energy. No scheme has yet been devised whereby the heat contained in the molten slag can be utilized. Sporadic attempts have been made to this end, but no method has been evolved whose application is of general value. Similarly in the quenching of the pig iron after it has been moulded, a considerable loss of heat energy occurs. But in the production of coke for use in the furnace the loss of energy is most marked. In the case of bee hive ovens the whole of the volatile hydrocarbons are entirely lost. The incandescent coke is quenched in the oven, and again energy is dissipated to the winds. With the by-product ovens, the most serious loss occurs in this quenching. The red hot coke is pushed out of the rectangular ovens and is quenched on a platform with a stream of water. In view of the efficiency of all the other operations of these ovens, this wasteful method is anomalous. It is surprising, indeed, that it has not been superseded long ago. That the utilization of this hitherto wasted heat energy is practicable is demonstrated by Mr. Charles E. Arnold in an article on "Quenching of Coke," in the May number of *The Chemical Engineer.*

In principle his plan is simplicity itself: "The hot coke is pushed from the oven directly into the cooling apparatus, which communicates directly with any oven which is ready to be 'pushed.' The coke having been received into the compartment, the doors are closed and the outside air entirely excluded. The small amount of air in the compartment is soon deoxygenized, and the hot gases (nitrogen, carbon monoxide and carbon dioxide) are drawn away from the coke, blown through a cooling compartment and again in contact with the coke. This circulation is kept up for a short time, when the coke can be discharged into the air without danger of combustion.

"The heat from the coke has been carried by inert gases to the iron coil, which conduct it to the water or other cooling medium circulating within said coils, thus making every unit of heat given up by the coke available for regeneration for a multitude of purposes." The still unremedied leakages of energy might very profitably become subjects of attention from the various Technical Colleges.

PROPHETS WITHOUT HONOR

The conferring of honorary degrees is a pleasant and profitable function. It is expected of our larger universities that they will see to it that those on whom they bestow recognition shall not only be in themselves worthy and distinguished men, but that they shall have been directly or indirectly of signal service to the community or to the country at large. Thus it is appropriate that the professional man whose work, whether literary or scientific, or specifically technical, has actually benefited his fellows or has ameliorated the hardships incidental to any class or classes of society or, in fine, has tended in any way to improve the conditions of life, should receive official recognition from the universities. But our universities are educational institutions supptored by the people, for the people. Doubtless the larger foundations serve a dignified and useful purpose in conserving the ideals and maintaining the best traditions of the Canadian people. But their first duty is to fit our young men to earn a livelihood and to recognize and encourage men, Canadians primarily, who are doing and have done something to advance the material welfare of their native land. In glancing over the names of those upon whom in late years the University of Toronto has conferred honorary degrees, we find men of letters, politicians, doctors and lawyers. Many of these are distinguished foreigners, whose relation to Ontario's welfare it is hard to guess. We do not question their worthiness. But we wish to suggest, not without humility, that the Province of Ontario and, indeed, the Dominion of Canada, owes far more to the geologist, to the mining engineer, to the civil engineer, and to the technical man generally, than to any of the classes that Ontario's largest University has chosen to honor. We would further suggest that the University of Toronto need not look far afield to find creditable recipients for the honors of which she has the bestowal. The world is moving.

LABOUR

It would be well for the Federal authorities to take prompt measures to relieve the dearth of labor in the West. In British Columbia and the new Provinces the the production of coal could be greatly increased were there a sufficiency of labor. The operators of metalliferous mines in British Columbia have been forced to grant substantial increases of wages to their employes to prevent them from leaving for other parts. These distressing conditions will, in the case of the coal mines contribute towards another fuel famine next winter Metalliferous mining in British Columbia is but now recovering from a long period of depression. It is essential that these industries be watched and guarded. The Federal Government employs emigration agents in Europe, and it has ample sources of information. The streams of immigration are, to a certain extent, dirigible

It should be quite feasible not only to select the proper class of workers across the ocean, but to place them exactly where they are needed.

THE PAYNE MINE

The once famous Payne Mine was sold at public auction in Montreal to Senator Forget for $60,000. The bidding started at $800. In its time the Payne paid over $1,000,000 in dividends. The property consists of four small claims on Payne Mountain on the slope toward Carpenter Creek. The Payne was stupidly and grossly mismanaged. It is safe to predict that in due course it will once more become a producer.

The original company was organized in 1891, and was capitalized at $2,500,00 in $1 shares. From 1899 the shares fell steadily until a few years later they dropped to 10 cents. They then disappeared from the market.

PROGRESS

The large amount of mining machinery under order or being installed in the Cobalt camp is an encouraging symptom. In itself it is indicative of progress and may be taken as tangible evidence that the mine owners in general have faith in their properties. The needs of the camp have created a temporary famine in ore mining machinery. Air compressors and other machinery ordered six months ago from the manufacturers are still undelivered. These delays are especially costly to mines groaning under heavy share capital. Every effort is being put forth to catch up with the unexpected volume of business. It is quite apparent, however, that the manufacturers have been caught unprepared.

EDITORIAL NOTES

The new mining law in Germany has passed its third reading and been referred to the Upper House. The most important provision reserves the right of exploration in certain areas to the State, with the power to transfer the working rights to others against indemnity and with a temporary title.

Of recent years (one might almost say of recent months) gas producers and gas engines have been improved so markedly and their application widened to such an extent, that the cost of power has been cut in two. Peat and lignite are now possible and profitable sources of commercialy saleable energy. A peat bog may now become a rival of Niagara. There is already a growing tendency to develop power at the coal mines and transmit it electrically. The effects of this movement wil be entirely beneficial. The enormous waste, which is the usual concomitant of the usual methods of raising steam, will be obviated and a much higher efficiency in developing power will indirectly conserve our coal resources.

In our respected contemporary, *The Mining and Scientific Press*, there appeared recently an article entitled "On Technical Writing." Many of the pet phrases current among mining men were heartlessly impaled as specimens of "bad" English or as inaccuracies. While we concur entirely with the spirit of the article referred to, we may be allowed to remark that in another respect the composition of many technical men is faulty. To ourselves the laws of punctuation have always appeared to be a blot upon our civilization. The writer who seeks to punctuate by rules need have no other ambition in life. However, the remedy is at hand. A Toronto writer, Dr. J. D. Logan, in a quietly revolutionary little book, "Quantitative Punctuation," has breathed upon the hitherto sacred "laws" and they are not. We seriously recommend "Quantitative Punctuation" to all young technical writers.

It is now generally admitted by the best authorities that the spontaneous ignition of coal is attributable to the action of the occuded oxygen in the coal. Freshly-mined coal absorbs oxygen freely. Since the coal in some degree retains is original porous structure, these pores are filled with methane and carbon dioxide, gases associated with its origin. Freshly-mined coal, on exposure to the atmosphere gives up these gases and absorbs oxygen. In large pieces of coal this action is superficial; but it is tremendously increased as new surfaces are exposed by breakage. This phenomenon in itself can not bring about ignition. There must be at some point an extrinsic factor which causes a local rise in temperature.

Moisture is a very potent factor in promoting the chemical action of the occluded oxygen. Iron sulphide, despite the popular idea that it is the principal agent in causing spontaneous ignition, plays but a subsidiary part

We referred in a previous issue to the mischief wrought by unqualified or spurious assayers. A mining boom always brings with it a swarm of pseudo-assayers, imitation mining engineers and professional crooks. Cobalt has been afflicted with all three varieties. But as she takes her place as a steadily productive camp, she will give a more and more attentive ear to the reputable, honorable men of experience. To-day the better and cleaner element is in the ascendency. When Cobalt has attained her majority she will look with disgust upon the frisky fakirs of to-day, and a full page advertisement will cause her pain.

British Columbia Copper Company's Mother Lode Mine, Boundary District of British Columbia.

By E. Jacobs.*

Copper mining in British Columbia has steadily advanced in importance during recent years, and this to such an extent that the value of the copper produced was considerably in excess of that of any other mineral included in the Province's total production of nearly $25,000,000. While not the largest producer in the Province, the British Columbia Copper Company ranks second only to the Granby Consolidated Mining, Smelting and Power Company as regards total production of copper to date. It is therefore fairly entitled to rank as representative of the copper mining industry of the Canadian West, hence the choice of its largest mine—the Mother Lode—as the subject for an article illustrative of that industry.

Before giving information concerning the Mother Lode mine a digression will be made for the purpose of showing the relative positions of British Columbia generally and the Boundary district of that Province particularly as producers of copper in comparison with that of all the remaining parts of the Dominion combined. Incidentally, the proportion of copper in last year's total mineral production in Canada will be shown as under:

Important Position Occupied by Copper.

Next to gold among the metallic minerals produced in Canada is copper, the production of which in 1906 was, according to the preliminary estimate of mineral production made public last March by the Mines Section of the Geological Survey of Canada, in value more than one-fourth of the total of metalliferous minerals produced, and more than one-eighth of the total mineral production—metallic and non-metallic—of the Dominion for the year. The respective totals were given as under:

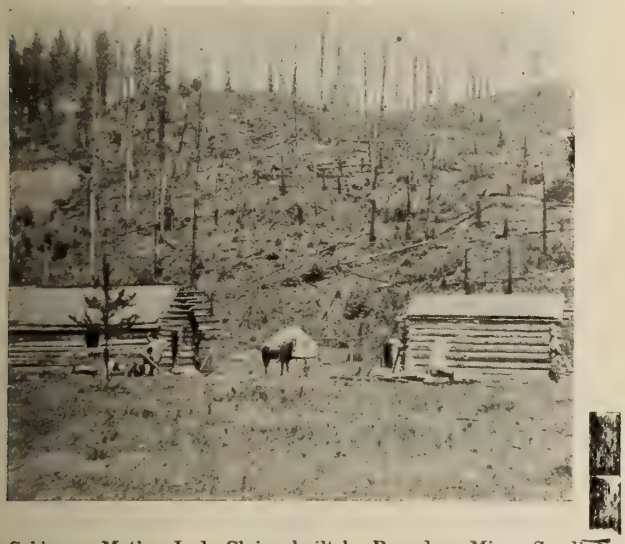
	Value, 1906.
Copper	$10,994,095
All metallic minerals	42,979,629
Total mineral production	80,000,048

Ten years ago the position stood thus:

	Value, 1896.
Copper	$ 1,021,960
All metallic minerals	8,030,633
Total mineral production	22,474,256

MOTHER LODE HILL IN FALL OF 1896.

These figures show that the production of copper has increased in much greater proportion than other minerals, in what ratio is easily calculated from the foregoing figures.



Another comparison shows that by far the greater part of the increase in the production of copper has been made in the Province of British Columbia. The figures for that Province and the remainder of the Dominion, respectively, are as follows:

Production of	Value in 1896.	(1906. (Unrevised.)
British Columbia	$ 190,926	$ 8,675,100
Remainder of Dominion	831,034	2,318,995
Total	$1,021,960	$10,994,095

These figures indicate most unmistakably that, in regard to the production of copper, British Columbia occupies a place of pride in the Dominion.

*Editor *British Columbia Mining Record.*

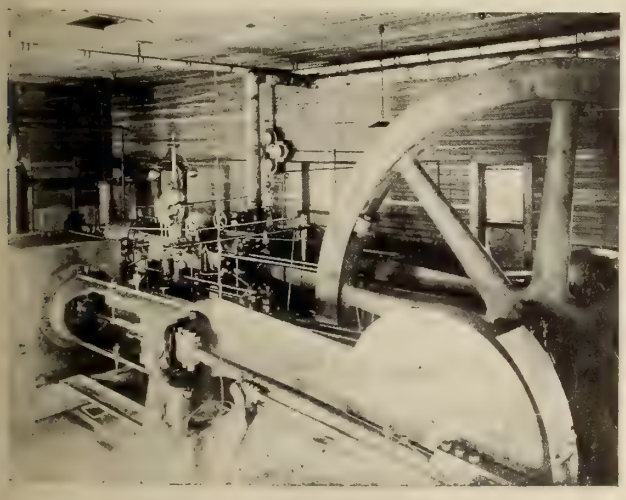
Prior to 1894 there was no copper produced in British Columbia, or if there was the quantity was so small as not to have found place in the official records of mineral production. A comencement was made in 1894, when copper to the value of $16,234 was produced, partly by Nelson and partly by Rossland mines. Thereafter these mines continued to be the only producers of copper in the Province until, in 1900, mines in the Boundary section of Yale district commenced producing and quickly became important producers. By this time Nelson's production had decreased considerably. The

First Cabins on Mother Lode Claim, built by Boundary Mines Syndicat in 1896.

leading position since taken by Boundary copper mines over those of other copper-producing sections of the Province is exemplified in the following table, showing the total production of copper ore in British Columbia in all years to 1906, inclusive:

District.	Lb. of Copper.
Nelson	12,300,00
Rossland	63,825,000
Boundary	135,500,000
Coast	30,000,000
Other parts of Province	1,790,000
Total	243,415,000

During seven years (to end of 1906) Boundary mines produced 4,609 tons of ores, practically all of it copper ore of a low grade. The proportions of this total contributed by the several mines of the four copper mining companies operating in the district are as under:



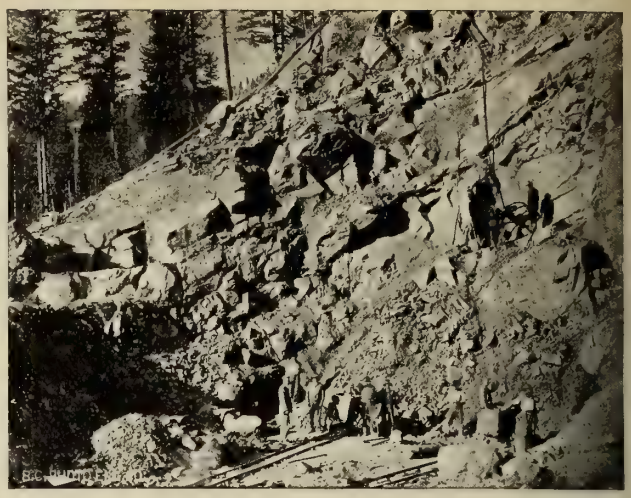
Company.	Tons.
Granby	3,005,000
British Columbia Copper	1,073,000
Dominion	390,000
Consolidated M. & S. of Canada	102,000

The remainder of the production of this district was chiefly from small silver-gold mines.

The British Columbia Copper Company, Limited, with head office in New York City, is working six mines in the Boundary district, four of which are in British Columbia and two in the adjoining State of Washington, just south of the international boundary line. Of these the Mother Lode is the largest. It is typical of the big copper mines of the district and, though not so extensive as the combined mines of the Granby Consolidated Company in Phoenix camp, distant about seven miles from the Mother Lode, is a decidedly important and valuable mine, having a producing capacity, as now opened and equipped, of about 1,000 tons of ore per diem, and with further development in progress in preparation for a still larger output

The Mother Lode is situated in Deadwood camp, about three miles west of the Town of Greenwood. The mineral was located on May 28th, 1891. The surrounding hills were but thinly timbered, and the big copper-stained bluff or "blowout," then a prominent feature, could be seen from such a distance that the prospectors had no difficulty in finding "mineral in place" to warrant their making the location. The accompanying view of the Mother Lode hill, reproduced from a photograph taken by Mr. Keffer in 1896, gives a fair idea of the surface appearance the claim presented shortly after the work of prospecting the big showing of mineralized rock occurring on it had been fairly commenced.

Prior to 1896 there had been no work done on the Mother Lode other than the very limited amount necessary to fulfil the annual assessment requirements. In that year the claim was bonded by Col. John Weir, representing himself and Messrs. F. L. Underwood and Jas. F. Tichenor, all of New York City. Mr. Frederic Keffer, now president of the Canadian Mining Institute, was placed in charge of the property immediately after the bond was obtained and thereafter he developed it for the Boundary Mines Syndicate, formed by the three gentlemen first above named. When Mr. Keffer commenced work there was not a tunnel nor a shaft 25



40-Drill Air Compressor. Installed in 1902.

Canadian Rand Hoisting Engine. Installed in 1902.

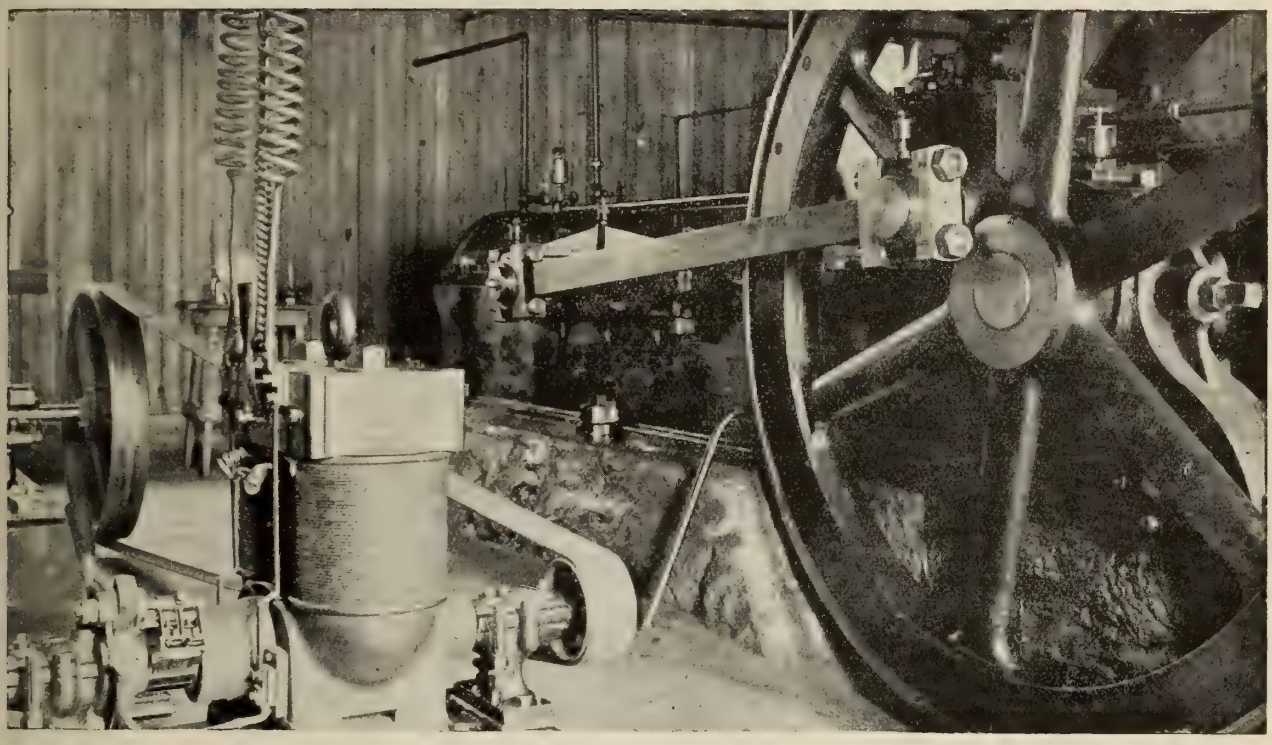
feet in length or depth on the claim; to-day he is still in charge and during the intervening periods of between ten and eleven years there has been done under his direction development work that in sinking and raising, drifting and cross-cuting, has aggregated fully 21,000 lineal feet (about four miles), leaving out of account much other work done in underground stoping and surface quarrying in the big ore bodies opened up here.

In March, 1897, prospecting operations having meanwhile proved the occurrence on the Mother Lode and adjoining mineral claims of unusually large bodies of ore, the British Columbia Copper Company, Limited, was organized in New York, to acquire and work the Mother Lode group, consisting of the Mother Lode and five adjoining fractional claims previously purchased, the whole giving an area of about 80 acres. A power plant was installed and the systematic development of the mine undertaken. The plant consisted of two 60 horse-power steam boilers, 10-drill Ingersoll-Sergeant air compressor with complement of drills, station sinking pumps, Ligderwood hoisting engine with 30 inch drum, and all else requisite to make a complete plant. The weight of this machinery, etc., was about 85 tons, and it was no light undertaking to haul it in wagons from the railway at Marcus, Washington (at that time the nearest railway station), to the mine, a distance by road of 65 miles. A two-compartment shaft was sunk and levels opened at 200 and 300 feet depth.

Open Quarry as it appeared in 1902.

Three years later it became necessary to provide a much larger power plant, so an air compressor having a capacity of 30 to 40 machine drills, and supplied with steam from two 100 horse-power boilers; a Canadian Rand double cylinder hoisting engine, with cylinders 22 x 42 inches and drums of 6 feet diameter, with two 80 horse-power boilers to furnish steam for operating; two large rock crushers, and much other machinery, were installed. Ore bins having a holding capacity of about 3,000 tons were erected, and bunk and boarding house accommodation was provided for more than 100 men, beside cottages for married employes. Recently electricity was substituted for steam to drive the heavier machinery.

GENERAL VIEW OF MOTHER LODE MINE IN 1902.



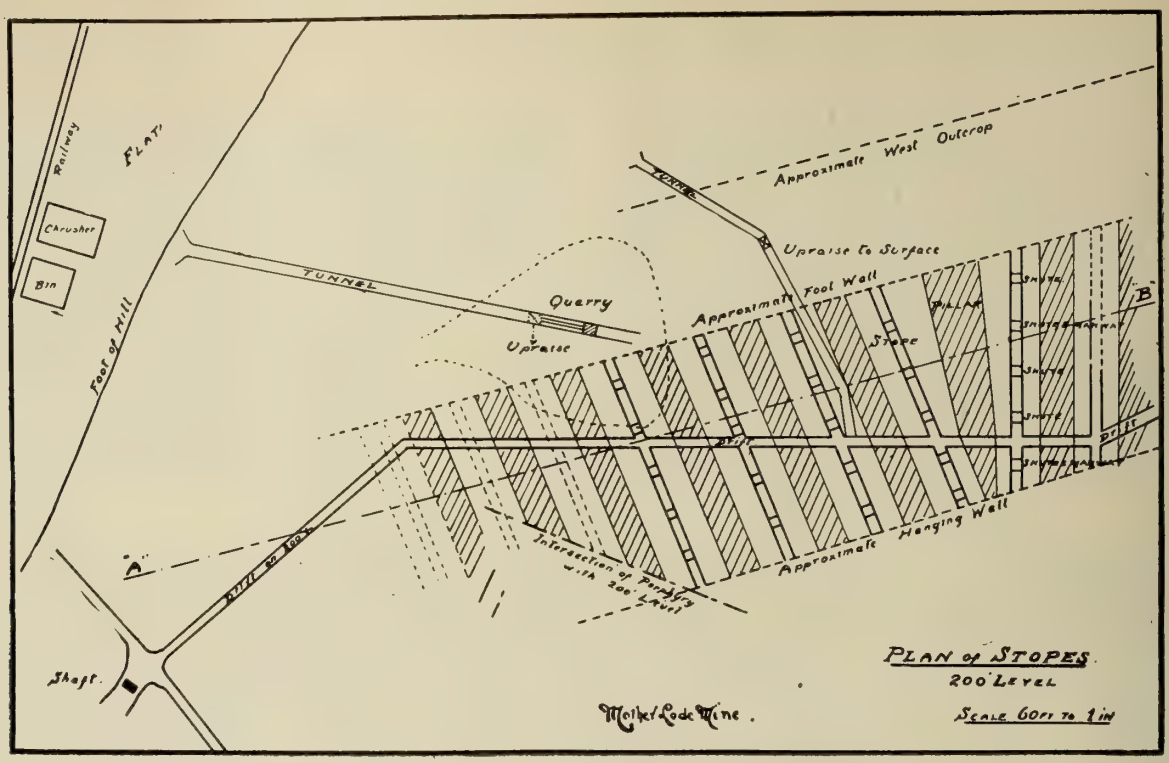
Open Quarry as it appeared in 1902.

The several different methods followed in working the mine, after the company had erected smelting works and it became necessary to regularly maintain a comparatively large output of ore, were dealt with in two papers contributed by Mr. Keffer to the "Journal of the Canadian Mining Institute" in 1902 (p. 213, and 1904, p. 42), respectively. One plan, known as the "pillar and stope" method, which continues to be of interest to mining men, was thus described by Mr. Keffer:

"The ore body was divided into stopes 30 to 40 feet wide, the length of the stope being the distance across the ore body. The cross-cuts already existing were used, and others cut where needed under the centre of each stope. From these cross-cuts upraises were made 30 feet apart. These were made 10 to 12 feet high, and were then connected by second and parallel cross-cuts. From these latter the stopes were opened out the intended width, and then carried vertically upward, the short upraises being cribbed and fitted with gates for loading. Between the stopes, pillars 20 to 25 feet in thickness

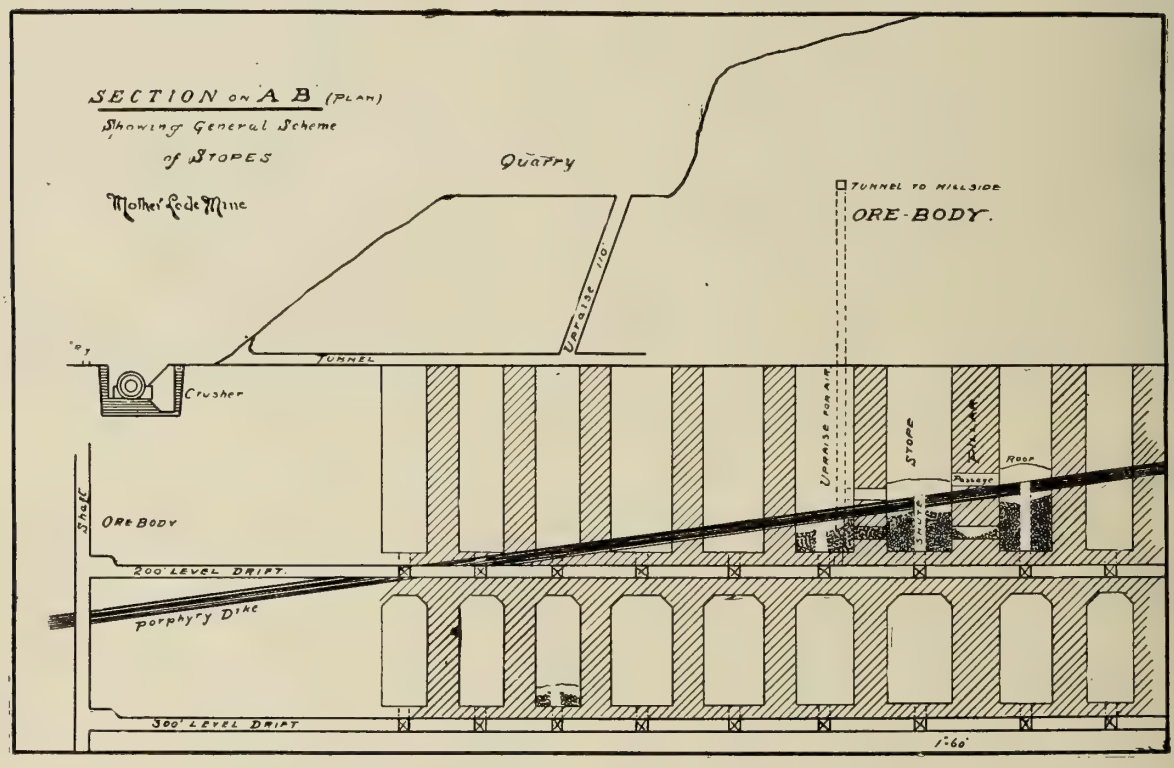
were left, these being frequently pierced to allow intercommunication and ventilation." The accompanying plan and section illustrate the general arrangement of the workings.

Afterwards the quarrying system, briefly noted by Mr. Keffer in his first paper, was so greatly extended as to admit of the hoisting of ore from the underground workings of the mine being discontinued for two or three years. Last year, however, in preparation for the considerably larger output that would be required to provide for the much-increased treatment capacity of the company's smelting works consequent upon the installation of three 600 to 700 ton blast furnaces, underground development was resumed in the mine. The main shaft was enlarged to a four-compartment shaft and deepened to 475 feet; a level was opened at 400 feet depth, and a second connection between the 300 and 400 foot levels was made by means of a winze. Much exploratory work was done by diamond drill with gratifying results, new drift, and its width as much as 200 feet. The foot wall is for the most part limestone, and the wall an altered diabasic rock. Sometimes there is a sharp demarcation between thelode and its walls, but in other instances the boundary is obscure. The ores themselves (so far as found) may be classed into three general groups: (1) A calcite carrying copper pyrites and iron pyrites, these sulphides sometimes being massive and sometimes scattered in small crystals throughout the rock. Some quartzite is also often present; (2) a silicate of lime, iron, magnesia and alumina, carrying both copper and iron pyrites, massive or scattered, and often also carrying quartz, or garnets, or serpentine, or often all three. Now and then a small amount of zinc blende occurs in this class of ore. (3) An excessively hard magnetic oxide of iron, with silica and copper pyrites; not often much iron pyrites. All these carry gold, and the calcitic and silicious varieties also carry small amounts of silver, about 1 or 2 ounces."



TEN-DRILL AIR COMPRESSOR. INSTALLED IN 1898.

bodies of ore of a shipping grade having been located. Beside preparing for stoping ore on all three levels—200, 300 and 400 feet—much work was done on an intermediate level opened at about 100 feet below the surface in a big body of sulphide ore. As a result of these developments underground, and of further additions to plant and machinery, the daily shipping capacity of the mine has been increased to about 1,000 tons of ore, crushed to a size suitable for charging into the blast furnaces at the smelter without further preparation.



Concerning the character and extent of the Mother Lode ore bodies, Mr. Keffer, in his first above mentioned paper, said: "The croppings are in places soft oxides of iron from decomposition of ore-bearing rock, and in others unaltered magnetic iron oxides very solid and compact, carrying copper pyrites, iron pyrites, more or less quartzose material, and also carrying gold. The extent of the lode is surprisingly great, its length being some 1,100 feet to where it disappears under the heavy

After two or three years' experience of these ores had demonstrated their smelting characteristics, Mr. Keffer wrote:

"From a smelting standpoint, the ores of the larger Boundary properties have, as a rule, grown less basic as the workings have been extended and deepened. That is to say, the proportion of iron oxide ores to the whole ore body has sensibly diminished, there being no great change in the amount of other base. Whether or not this reduced proportion of base to acid ore is to be permanent, it is (at any rate in the case of the Mother Lode mine) impossible to predict. Long experience in mining these deposits has shown that it is not possible to make safe predictions as to occurrence of zones of mineralization, new ore bodies frequently having been found in unexpected places. On the 200 foot level of this mine there has been found considerably less oxide of iron ore than in either the quarries or the 300 foot level. The iron oxides of this latter level are uniformly of higher

PLAN OF STOPES, MOTHER LODE MINE, 1902.

SECTION OF STOPES, MOTHER LODE MINE, 1902.

grade than those of the quarries carrying more copper and gold, and they do not appear to be directly connected with the upper deposits, although this is not absolutely proven . . .

"The change in the basic character of the ore is illustrated by the following average slag analyses, taken over corresponding periods of 1901, 1902 and 1903. The small tonnage of foreign ores treated affects the assays somewhat, but not materially:

Year.	Silica.	Per cent. Iron.	Lime.	Total.
1901	33.2	28.5	20.6	82.3
1902	40.5	22.2	20.2	82 0
1903	42.7	20.4	20.2	83.3

GENERAL VIEW OF MOTHER LODE MINE IN 1907.

"With slags runnings in silica from 40 to 43 per cent. and matte at 40 to 45 per cent. copper, it is found that the furnaces can be maintained in good running condition, and slag losses kept within proper limits. To guard against possible scarcity of iron fluxes it has, therefore, become the general practice to conserve the iron ores of the mines, using only sufficient to keep slags within bounds above indicated."

The Geology and Ore Deposits of Franklin Camp, B.C.

By R. W. Brock, Ottawa, Ont.

(Toronto Meeting, 1907.)

The steady increase in the mineral production of British Columbia, which, last year, is estimated to have exceeded $26,000,000, the dividends now being paid. not by one concern, but by a considerable percentage of the operating mines, the continued increase in the demand for copper and the corresponding great advance in its price, the opening up of new territory by railway construction, the general prosperity throughout the commercial world, have all contributed to a revival of outside interest in mining in this Province, and to restore that confidence which, since the collapse of the '97 boom had been withdrawn. This renewal of interest will find expression in the reopening of properties now lying dormant in the older districts and in the birth of new camps. Portents of this are not lacking. One of the first districts to benefit by this improvement in conditions is what may be termed the hinterland of Grand Forks.

The Town of Grand Forks is situated in Yale district, at the Forks of the Kettle River, the eastern entrance into the Boundary Creek District. Its chief industry is the large smelting works of the Granby Company, which treats all the ores from their Phoenix mines, located on the mountains a few miles to the west of the town.

A short distance up the north fork of Kettle are several small mineralized areas that were partially developed some years ago, but which have been neglected the last few years. Farther up stream, on the east branch of the north fork, forty-three miles from Grand Forks, is Franklin Camp. It was located by Franklin MacFarlane, for many years a trapper on this stream. His discoveries and those of some friends attracted prospectors, and in 1900 a little colony of them were busy in this camp. During the same summer a reconnaissance survey, which included Franklin Camp, was made on behalf of the Geological Survey by the writer and Mr. W. W. Leach. The results of this survey were embodied in the West Kootenay map sheets, published by the Department.

But the camp had come into notice too late to be benefited by the boom. Moreover, it was three days' journey by pack train from Grand Forks; there was no immediate prospect of transportation facilities, and none was prepared under these conditions to buy surface showings at boom prices. During the last two seasons, however, some attention has been paid to the district north of Grand Forks. Last summer a wagon road was constructed to the camp, bringing it within eight hours' stage journey from the railway, and work was begun on a branch railway from Grand Forks up the North Fork to Franklin. Several townsites had been platted, and hotel and store accommodation provided.

Some of the salient points in the geology and tography are shown on the map, taken from the West Kootenay sheet of the Geological Survey. Many of the geological boundaries represented are only approximate, as when the reconnaissance was made the country was to a large extent timbered. Since that time the district has been burnt over and the rocks and ledges are now much better exposed; but as my visit last summer was restricted to one day, nothing could be done toward revising the

boundaries. The present paper is based largely on observations made during the reconnaissance.

The geology of the camp is somewhat complicated. The oldest recognized rocks are sedimentary, often greatly metamorphosed. Among these the most conspicuous, when not too highly altered, is limestone. It is metamorphosed to crystalline limestone and lime silicate hornfelds. The latter is sometimes a green and sometimes a compact, broken-up, light-colored, porcelain-like material, resembling a baked argillite. When alteration to silicates has been uneven and incomplete, a breccia-like or conglomerate-like rock results, with the green silicates sometimes as the matrix, with limestone rests and sometimes as the nodules, with an unaltered limestone matrix. The limestone and its alteration products occupy a larger area than represented by the limestone coloring on the map. Some argillites occur in this series, and closely associated are some greenstones. Large masses of gray Nelson granodiorite is intrusive in these basal rocks. Both these formations are intruded by small masses of a gabbro-like rock and a porphyritic syenite distinguished by its long reddish feldspar crystals. Towards the west, forming the West Branch divide, is a light acid granite (Valhalla Granite) intrusive in the above series, and to the east a pink, alkali-syenite, also later than and intrusive in the above formations. Numerous porphyry dykes from these intrusives traverse the older rocks.

At many points overlying the previous formations is a series of Tertiary rocks. These consist of quartzite-like, gritty tuffs with coarse conglomerate bands, conglomerates and ash beds, and overlying these again, lava flows with some inter-leaved ash rocks. The conglomerates hold pebbles and boulders of the older rocks, particularly of the granodiorite, limestone, greenstone and an older, finer-grained conglomerate These range in size from a half inch to two feet in diameter. The conglomerate appears to cover a greater area than represented on the map, reaching in places to the North Fork bottom. It is cut by dikes from the alkali syenite and from the volcanic rocks.

The lava beds, which occupy the higher levels, show in places basaltic jointing. Some beds are rich in gas pores, the latter often containing agate, calcite or zeolites. The intrusive rocks have profoundly altered the older formations over considerable areas, and incidentally ore deposits have been developed in the latter.

The deposits so far uncovered present several more or less distinct types.

1. Those in which the gangue consists of country rock altered to green lime-silicates, such as hornblende, epidote, garnet (generally reddish), with quartz and calcite. Such deposits, since they are especially apt to occur in the (altered) limestone may be, for convenience, called the limestone type.

Deposits of this class differ in the relative amounts of their metallic minerals, and, using this as a basis, may be sub-divided into—

(a) Pyritic Type—The metallic minerals consist predominantly of pyrite and chalcopyrite.

(b) Magnetitic Type—The metallic minerals consist predominantly of magnetite, with some copper and iron sulphides.

(c) Galena Type—The metallic minerals consist of galena, blende and chalcopyrite—this type occurs on the McKinley near type a and b; the silicate minerals are not prominent in the exposures on this lead, the crystalline limestone often abutting against the sulphides.

2. Chalcopyrite, or pyrite deposits with molybdenite, calcite and quartz in crushed zones, fractures, fissures or near contacts. Replacements or substitution of the minerals of the country rock by ore is usually conspicuous. Granodiorite or porphyritic syenite formed the country rock in all deposits of this type seen by the writer. For convenience, then, these may be referred to as the granite type.

3. Quartz veins, in which quartz is the dominant mineral accompanied by galena, blende, pyrite, chalcopyrite, molybdenite, arsenopyrite, etc.

The most extensively developed claim is the McKinley, on which approximately $30,000 has been expended in surface improvements, trenching, tunnelling and diamond drilling. On the north slope of McKinley Mountain in a band of crystalline limestone, running north across Franklin Creek to Franklin Mountain, four leads have been discovered. The strike of the leads has not been definitely determined, but they appear to be lying transversely to the direction of the limestone band—here about 300 feet wide. Along these leads the limestone is more or less changed to epidote, hornblende and garnet. The lowest lead, exposed by an open cut, shows a heavy development of magnetite, with some pyrite and chalcopyrite. The latter, while somewhat disseminated in small specks, show a tendency to accumulate in veinlets in the magnetite. Diamond drilling, which was in progress on this showing, was said to be demonstrating a fair sized body of ore.

The second ledge outcrops for a width of about 30 feet, but the dip is at a low angle southwest. It shows a heavy development of galena and blende as well as chalcopyrite. The lime silicates are only sparingly developed here, the crystalline limestone being often in direct contact with the galena. Only open cuts have been made in this lead. The grade of ore is stated to be high, particularly in silver. The third ledge, in which the chief work has been done, holds iron and copper pyrites, with a considerable amount of the gangue minerals. It is supposed to be about 40 feet wide, dips 45 degrees south, and has been traced for 300 feet.

The main working is a tunnel. About 100 feet in, a cross-cut has been run westward 104 feet, the last 80 feet of which is in ore. Two hundred and fourteen feet in the tunnel 15 feet of ore is encountered (No. 4 lead). This ore is like that of No. 3, except that it contains less pyrite and more chalcopyrite.

Average assays of the largest ledge are said to run about 2.5 per cent. copper and about $2.00 in gold and silver.

The McKinley Company are also testing the Banner claim on Franklin Mountain by diamond drilling. This claim has not been seen by the writer since 1900. At that time a strong, very wide lead of quartz, mineralized with galena blende and chalcopyrite were exposed.

On the Maple Leaf claim, on the northeast slope of Franklin Mountain, copper ore occurs in the reddish porphyrite syenite near and along its contact with the basal formation. The mineralization is confined almost exclusively to the intrusive rock. Fractures in this syenite are filled with seams of chalcopyrite and pyrite, or with green malachite resulting from the alteration of the copper ore by atmospheric weathering or surface water, and in addition there is marked selective replacement of the minerals of the syenite by the sulphides. The colored constituents are more readily replaced, so that where the action has not been excessive the prominent feldspar crystals may be found lying in a sulphide base. Where the replacement has been more extensive, the feldspars are attacked, and finally the whole mass of rock becomes sulphides. At several points along the contact, which is generally covered with wash, wide stretches of the more or less mineralized syenite have

been uncovered. About 400 fet back from the contact, an open cut has exposed a lode 4 feet wide of fairly well mineralized rock.

The Gloucester group, now being worked under bond by the Dominion Copper Company, was not visited. On the G. H. claim of this group is a ledge of magnetite, with a little pyrite and chalcopyrite. In places it is at least forty feet wide, and it has been traced several hundred feet. It seems to lie wholly in the grey granodiorite. On the Gloucester was a good showing of copper ore, with pyrite, molybdenite, calcite, and quartz, with grey granodiorite on one side at least, but the country rock is badly altered. Development here is made more difficult by some faults which have been encountered.

On the south slope of Tenderloin Mountain, several copper lodes were seen during the survey of the district. They occurred in the grey granodiorite, in fractures, or crushed zones. In the latter, the rock is sometimes crushed to a sort of nodular structure, the more highly triturated material of the rock wrapping round the ball-like rests of unbroken material. In these crushed zones, particularly along well-marked fracture planes, the mineralization by copper and iron sulphides is quite heavy.

In addition to the claims mentioned, a large number are held, on which deposits of one or more of the types mentioned, have been discovered. Most of the claims spoken of lie within an area 3 x 1 1-2 miles, and an area 8 miles long by 1 to 4 miles wide—covering both sides of the river, would embrace most of the discoveries so far made. There are possibilities, however, in this camp over a somewhat longer and a much broader area—all that ground lying within the encircling, recent acid or alkali eruption rocks, for all the older rocks of the camp, the altered basal rocks, the granodiorite, gabbro and porphyritic syenite are mineralized and lode-bearing. Lodes of the first type are likely to occur in the continuation of the limestone band northward from the McKinley, and in other limestone or altered limestone areas. Contacts seem promising points for prospecting, and in addition to the contacts, shear or crush zones in the massive rocks. From what has been seen of the acid granite, and the pink alkali syenite (Rossland alkali syenite) and the Tertiary lavas, both here and elsewhere in this Province, it is altogether unlikely that workable deposits, at all events of the described types, will be found in these rocks, but the older formations along their contacts, and along dykes from them is good ground to prospect.

In its geology and the nature of its ore deposits it bears a strong resemblance to the Boundary Creek district. The main rock formations are common to both, as are deposits of types 1a and b, and 3, the main difference being that in the Boundary sulphur is less plentiful, so that pyrrhotite is found in place of pyrite, and iron oxides are more prominent.

Deposits of Type 1 are connected with contact metamorphism by intrusive rocks—and are to be explained by the influence of heat, together with mineral-charged water or vapors given off by the cooling intrusive magma upon the country rocks. Such emanations ascend as best they are able by all sorts of channels, among which fissures and fracture planes are likely to be important. The rock along these channels usually exhibits characteristic alteration, produced by these mineralizers, and is often replaced by the mineral matter carried by them for some distance on either side of the channel—especially when complex fractures enable the solutions to wander into the rock and expose a great number of surfaces of attack. It will be evident that contact metamorphic action will not be confined to the immediate contact of the intrusive rock (indeed may be absent there) but may be irregularly distributed, according to the physical and chemical characters of the neighboring country rock, the distance below the surface, temperature and other precipitating conditions. There may be expected to be transitions between contact metamorphic deposits and ordinary lodes or veins, and such have been found in a number of places. Deposits of Type 2 are probably to be regarded as such—as are also the deposits of the Rossland Camp, now being mined. Deposits of the contact metamorphic type seem to be widespread in Southern British Columbia, not only in Boundary and Franklin, but in other districts as well, and will, no doubt, be recorded from a great many localities.

From descriptions of copper and magnetite deposits in the Similkameen, Kamloops and the coast, it would appear to the writer that examples occur in these localities. On the outskirts of the Rossland Camp the same type occurs, and transitional types to ordinary lodes and veins are widely distributed.

It has not been absolutely determined for Franklin Camp what intrusive rock has been responsible for the metamorphism and mineralization. The possibilities are the granodiorite, the alkali syenite, and the undiscovered or unrecognized plugs or dykes which gave vent to the lavas. The first is in closer proximity to the deposits in large exposed areas, but the second is well represented by large dykes; of the third, as no information is at hand, nothing may be said. The granodiorite is itself deformed and mineralized; the alkali syenite at certain points in this section is responsible for mineralization and seems to have been injected just prior to the great period of ore formation. Both these rocks are present in the districts of Southern British Columbia visited by the writer, which are characterized by this class of deposits. At present, the balance of the evidence seems to be rather in favor of the alkali syenite as the metamorphosing rock. In the Boundary district the large syenite porphyry dykes seem to have been furnished by the mineralizers. (1) In a recent monagraph (2) Lindgren ascribes the origin of the Clifton-Morenci contact deposits to porphyry dykes.

The contact metamorphic deposits, while distinguished by Von Goddick in 1879, have only in recent years been recognized as an important type, found in a large number of copper-gold districts, but an extensive literature on the subject is now being rapidly accumulated.(3)

Of the more important deposits of this class may be mentioned some of the Clifton-Morenci copper deposits, Arizona (4), the copper deposits of Cananea, Mexico (5), and the gold-copper deposits of many other parts of Mexico. In Eastern Ontario, the writer has recognized examples of this type.

Since limestone has been found to be the country rock of most of the contact metamorphic deposits hitherto described and consequently seems to be the rock most susceptible to this mode of alteration, and since in its impurities it contains many of the elements necessary to form with the lime the observed gangue minerals, the inference has been widely drawn that such deposits are peculiar to limestone contacts. This fact has been included in various definitions of this type of deposit. Many authorities (Rosenbusch, Barrell, Zirkel Klockmann) hold that the results are due to the alteration of impure limestones through heat alone, and that there has been no addition of material, by waters and vapors, at all events none to go towards the formation of the typical gangue minerals. Others, as Michel Levy, Vogt, Lindgren, Kemp and Blake, bring forward facts to show that some of the material of these minerals has been in-

troduced by emanations from the intrusive lava. In the Boundary Creek District the evidence is wholly in support of the latter view, (6) and the same seems to be true in Franklin Camp.

In many places the limestone is altered to marble, except in the mineral-bearing zones. These mineralized zones have not the accordance in strike, nor the regularity in distribution that impure bands in a limestone would possess. The ores must certainly have been introduced, and there is good reason for believing that the iron and silica of the silicates have been as well. Moreover, these deposits are not confined in these districts to limestone as a country rock.(7) In the Boundary Creek district the writer has shown that even the granodiorite is mineralized to some extent in this way, and that in it garnet zones are developed. A full description of this formation of garnet in granodiorite will be given in a paper shortly to be published. Kemp, in a recent paper (8), describes the formation of a similar mineral-bearing garnet zone in granite porphyry at White Knok, Idaho. In Franklin Camp, the magnetite ore of the Gloucester group, according to notes taken in 1900, occurs in the granodiorite, and some of the copper ores of the camp also have this as their country rock.

The development work already done in Franklin Camp is limited and shallow, so that it is not known how the values, particularly the copper values, will hold out in depth, nor is it yet demonstrated that a large tonnage of low grade ore can be maintained. To prove these points requires extensive development and time. While good values have been found on some of the lodes, it will probably be on low grade ore that the success of the Camp must depend. The results on the McKinley, so far, seem to be encouraging.

While nothing can yet be said of the extent and value of the mineralization, while it is yet too early to state that any one of the prospects is going to be a good mine, it may be said that the camp posesses many of the earmarks of a mineral-bearing district and that in kind, whether or not in degree, in the nature of its ores whether or not in extent, it takes its places in a goodly company of mining camps, among which its neighbor, the Boundary Creek district, is not the least important.

The expensive development work required in this camp will be greatly facilitated by the railway, and when this reaches the camp, its possibilities will no doubt be tested as they deserve to be.

THE BRITISH IRON AND STEEL INSTITUTE.

PRESIDENTIAL ADDRESS.

By Sir Hugh Bell, Bart.

A little more than a hundred years ago, when the nineteenth century was still in its salad days, my grandfather, the son of a Cumberland yeoman, came to the Tyne to enter the service of a well-known firm of Newcastle merchants, into which he was shortly afterwards admitted as a partner. He was born in Cumberland, near Woodside, the seat of the Losh family, and no doubt Mr. Losh, the senior partner, was instrumental in bringing the young man to "The Quayside," a term which indicated the business quarter of the cannie town as clearly as "the City" does that of the English metropolis.

That I, the grandson, occupy by your kindness the distinguished position of your president, and, in that capacity, am called upon to deliver an address this morning, makes it not inappropriate that I should choose as my subject a review of the position of the great trade in which we are engaged as it was then and as it is today, a century after the occurrence which identified the fortunes of my family with the maunfacture of iron.

I am only too sensible that it is because of my parentage that the choice of the Council has fallen on me, and that it is as the son of Sir Lowthian Bell that I have been selected to follow a most distinguished series of men who have adorned the chair I now unworthily fill. This affords an additional reason why I should choose for the subject of my address a sketch of the iron trade in the last hundred years, for his life, begun in 1816 and ended nearly ninety years later, almost covers the period I propose to pass briefly in review; to do so exhaustively would mean a great and profoundly interesting volume.

Let me then ask you to recall the position of the world in 1807, when the young Thomas Bell entered the firm of Losh & Company, so that we may understand from what platform we started.

The eighteenth century had closed on a world under arms. The titanic struggle which we identify with the name of Napoleon was at its height, and the new century opened amidst the din of battle. The power of the Colossus who was attempting to overstride Europe was undimmed, and rumors of invasion of "the little isle set in the silver sea," which strove to withstand the overwhelming onslaught of his armies were everywhere current.

The men of that day might well contemplate the future with anxietv bordering on terror. But before the first decade had closed an event occurred which, to those who had eves to see, put a term to the dreams of universal dominion, which had dazzled the imagination of the great Corsican. In October, 1805, Trafalgar Bay had witnessed a sight which virtuallv ended the conflict, though nearly ten years elapsed before the war of the giants ended and Europe was left free to effect the great commercial development which, in one of its aspects, I propose to lay before you.

For while Europe was one vast battle-field, and men's

energies were being devoted to arms and their capital to armaments, the fertile brains of inventors were busy. Great discoveries were being made, or, what is more important for our purpose, were being turned to useful ends.

Two centuries earlier men had become aware that a great instrument stood ready for those who knew how to use it, but the common opinion which gives to James Watt (1736-1819) the credit of the steam engine, and forgets Giovanni Branca (1601), Solomon de Caus (1615), the Marquis of Worcester (1663), Denis Papin (1690), and even Thomas Savery (1698), is doing that rough substantial justice which the popular view rarely fails to distribute. Though the great Scotchman was unquestionably aware of the importance of his improvements, which, in fact, made steam the powerful agent we know, even he would be surprised could he see how far his successors have surpassed him in its economical use, and what purposes they have made it serve. For Watt died in 1819, when the steamboat was in its earliest infancy and steam traction on land was hardly begun.

The propulsion of ships by steam dates from the end of the eighteenth century, but John Fitch's invention brought him nothing but misery, and led to his suicide in 1798. The Iron and Steel Institute is of so cosmopolitan a character that it would be unseemly to assert for Great Britain claims which may be contested. I will, therefore, not seek to award the merit of the practical employment of steam in ships as between my namesake Henry Bell (1767-1830) and Robert Fulton (1765-1815), though I might claim the credit for "Britain" in either case, since the American was born at "Little Britain," in Pennsylvania, while Bell hailed from Torphichen Mill, in Great Britain. The two purposes to which I have referred give us the reason why the nineteenth century should have witnessed the great industrial developments, to a rapid sketch of which my address is devoted.

While men were dependent on such puny instruments as those which had served their purposes since civilization dawned on the world, we may rather be surprised at the wonderful ingenuity which enabled them to accomplish so much than at the the slow progress which had been made. I have within the last few months visited the Valley of the Nile and seen with amazement the great works accomplished by a people who, as far as we know, possessed no other contrivances than the lever, the wheel, and the inclined plane, and those primitive instruments which our remote ancestors devised when they emerged from the rest of the animal creation and stood forth as men. The magnificent monuments of that wonderful land bear comparison for stupendousness with the great works which the engineers of the nineteenth century have constructed for the benefit of the country and the world at large, while in beauty they vastly surpass them. But without such assistance as we can now call to our aid, it is impossible to conceive the industry of the world on its present scale conducted under the conditions which produced the marvels we admire in Egypt.

Now, of all the aids we have at our disposal to-day, none is more important than the facility of transport. It has been said that no real improvement in this respect was made from the time when the Romans began to build roads till steam took the place of vital power as a propelling force, and that the Emperors Caracalla and Geta, hurrying from York to claim the Imperial purple in the third century, were no longer in reaching Rome than was Sir Robert Peel in returning from Rome to London to become the Prime Minister of Great Britain in the nineteenth. Yet till the power of bringing together in great masses the mineral resources of the world was attained the output of iron was limited to those districts where the ore and the fuel chanced to lie in juxta-position. The great developments of recent times depend entirely on the improvements in transport. What would the founder of the ironworks at Dowlais have said had he been told that their prosperity would come to depend not so much on the fact that the iron ore and the coal could be extracted from the same pit as on the accessibility of Cardiff to the Basque Provinces of Spain? And the two things react on one another—without steam transport a highly developed iron trade is impossible; without abundant and cheap iron steam traction is inconceivable. It is for these reasons that the history of railways is so intimately connected with that of the iron trade.

As is well known, the idea of a fixed and rigid path along which the wheels of a wagon should travel is a very old one, but until the end of the eighteenth century it had been but little utilized. It remained for George Stephenson (1781-1848) to show tthat it was essential to the construction of a road on which the means of traction should be that new power which the genius of Watt and his collaborators had placed at man's disposal. Here, again, the common opinion which connects the name of Stephenson with this great invention and disregards, or at least places in subordinate positions, Murdock, or Trevithick, or Blenkinsopp, or Hedley, does no more than substantial justice. The first quarter of the nineteenth century witnessed the trials and failures which were to end in revolutionizing carriage by land. In 1822 the first railway, in the modern sense of the word, was opened for mineral traffic, while three years later (in September, 1825) the first passenger line, the forerunner of the vast network which now overspreads the civilized world, began operations between Darlington and Stockton.

But to render this possible much more was needed than to invent the locomotive engine or the fixed path. Here, again, we find many names claiming to be inscribed on the roll of fame as entitled to the honor of inventor of the process which was destined to bear its part in the coming revolution. To Henry Cort (1740-1800) we must, in any case, assign a prominent place on the roll, for though we may deny him the title of "father of the iron trade," or even that of the "inventor of puddling," there can be no question that to his ingenuity the industry owes a deep debt—a debt only indifferently discharged by grants from the Government of the day, the last of which was made, at the instance of Dr. Percy, one of my predecessors in the chair, by Lord Palmerston, to Cort's only surviving son, in 1856. If to him we add John Wilkinson (1728-1808), and the veritable dynasty of Abraham Darbys, of whom the grandfather was born in 1677 and the grandson died in 1791, we have noted the chief of those whose endeavors towards the improvement of processes connected with the iron trade rendered it possible for the inventors of the railroad to make the fixed path of malleable iron produced in great quantities and at reasonable cost. It is not unnatural that the bulk of the names mentioned have been citizens of Great Britain. This country, from its physical configuration, its geological peculiarities and its limited size, presented the most favorable laboratory in which to try experiments. To these circumstances is due the fact that, at the beginning of the last century, one-third of the world's production of pig iron came from these islands, though the total production of the world did not exceed three-quarters of a million tons.

In every case it will be found that the production of iron depended on the proximity of fuel and ore. The iron trade of Sussex died when the exhaustion of the forests removed the fuel. Staffordshire, Scotland, South Wales, indeed every ancient seat of the iron trade in Great Britain, tell the same story, which is true of Sweden, of Russia, and of every country whence, before we entered on the new phase, we drew supplies. For it is interesting to observe that, in the past, England was an importer rather than an exporter of iron. From Sweden, which in 1780 was the chief producer, and from Russia she brought the metal which her smiths were to fashion into those goods for which she was early to become renowned. But though Sheffield holds and has long held the highest reputation for the excellence of her wares, it is significant that from Spain we derive bilbo as a name for our sword, and from Syria the word damascening to describe the pattern with which it is adorned.

But neither Bilboa nor Damascus bears any part in the history of the iron trade a hundred years ago. We must look to Germany, to France, to Belgium, and to Austria if we would see how the continent of Europe stood at the date we are considering. It will be noted that I do not repeat the names of the two northern countries from which, in earlier days, Great Britain drew her supplies. Sweden and Russia barely count in the developments we are considering. From producing something like one-seventh part of the output of the world in 1830, they have fallen to producing but about one-eighteenth in 1905, though their total outputs have risen from about a quarter of a million tons at the earlier date to over three million tons at the later date.

The great ironmaking districts of Germany which lie in proximity to the Rhine owe their importance to the facilities of transport afforded by the river and by the railways which line its bank.

The works at Essen date from about the time at which my review opens, for the firm of F. Krupp was founded in 1810, but it is not till 1850 that Westphalia begins to play an important part in the history of the trade. By that time, already, it had become possible to transport the ores of the Seig and the Lahn to the coal districts. The discovery of the Bessemer process marks another step in advance. Bessemer compels Westphalia to bring ore from Spain, Gilchrist and Thomas restore to the native ores their importance. The basic process marks a great stride, and in 1879 the astonishing development of the German iron trade begins, the production of basic pig iron rising to 8,039,808 tons out of the German pig iron production of 12,293,825 tons in 1906, whilst the output of Bessemer pig iron was only 491,086 tons. Again, it is the possibility of bringing ore from distant countries to the fuel needed to smelt it that this region owes its present position. It may be permitted to a subject of King Edward to point out that here too a citizen of these islands appears as taking a prominent part, and to recall the fact that one of the chief collieries in Westphalia is called "Hibernia," in honor of the nationality of the man to whom the initiation of the enterprise is due.

With the help of Mr. Brough I am able to append to my address a chronological table of great interest. In it, under the year 1811, will be found the following entry: "Moyeuvre was purchased by François de Wendel from the French Government." I may be allowed to pause to welcome as a member of the Institute the great-grandson of that François de Wendel (himself a François), to express our grief at the loss we have sustained by the death of his father, who was a Bessemer gold medallist, and our satisfaction at enrolling the honored name once more on our lists, which have been adorned by those of his father and his uncle, Robert de Wendel. I restrain myself from telling the story, full of romance, related to me by the second François de Wendel, which is covered by the words in tthe Appendix: The spoliation by the revolutionary government in 1794, the years of suffering and of preparation under a foreign sky, the painful return and recovery of the family properties in 1803, and the building up of a great family industry—a monument of perseverance continued over four generations and through political changes to which I must do no more than allude.

Among the other great works in France to which I should like to refer are those of Le Creusot, which have a special interest to Englishmen, as they were partly owned at one time—in 1823—by an English company, Manby-Wilson & Company, who purchased an interest in them from a French company. They date from a somewhat earlier period than that with which I am dealing, but it was not till 1836 that they passed into the hands of Messrs. Schneider, by whom they were rapidly developed, till they became the important establishment to which we were welcomed in 1899. We are proud to have counted among our honorary members one of the founders of the Schneider dynasty, to have had his son as member and Bessemer medallist, and now to be honored by the presence of his grandson on our Council. Terre Noire is of about the same date, having been founded in 1819.

In Belgium the great establishments at Seraing call for mention. They interest us in this country since the founder was John Cockerill, a Lancashire man, who settled in Belgium early in the century to join his father in the management of a factory for the construction of spinning and weaving machinery, and in 1817 founded the works now under the management of our colleague on the Council, Mr. Greiner.

Our approaching visit to Vienna would make me wish specially to refer to the part borne by Austria in the wonderful story I am attempting to tell. The Austro-Hungarian Monarchy is also an example of the same process of development. The manufacture of iron dates from the remotest antiquity, but does not begin to attain to important figures till the introduction of improved methods of transport. In 1830 the output is said to have amounted to 80,000 tons. Fifty years ago this quantiy had grown to just under a quarter of a million tons, while to-day Austria-Hungary contributes over one and a half million to the world's output.

The American continent presents the matter in yet clearer terms. I am glad that the limits I have laid down for myself do not call for any account of the position of the trade in that vast country before 1776. The selfish and short-sighted policy which marked our legislation as to our colonial trade makes unpleasant reading for us to-day. I may pass to 1810, when the make of iron was under 54,000 tons, which compares with 243,851 tons made in Great Britain. In 1840 this had grown to 286,903 tons against Great Britain's 1,396,400 tons. This slow growth continues, the United States not reaching the 1,000,000 tons, to which Great Britain had attained in 1836, till 1864, nor the second million till 1872. By this time, however, the means of transport were improving with extraordinary rapidity. The production pauses between the second and third million for seven years, the reaction of 1876 sending it below 2 millions (1,868,961 tons), jumps from 2 3-4 millions in 1879 to 3,835,191 tons in 1880, stays for five years between 4 and 5 millions, rushes to 5,683,329 in 1886, and so

onwards till in 1905 it has attained 23,360,258 tons, out of the world's total of 54,610,269, to which Germany contributes 10,875,061, and Great Britain 9,608,086 tons.

Steam transport by sea and land, steam and electric-driven instruments for dealing with the ship's contents when they arrive at the discharging quay, have alone rendered these extraordinary results possible. The vast distances which so lately as 1890 made a judge as competent as my father doubt the possibility of utilizing the great deposits in the West have been reduced to insignificance, and the coal fields of Pennsylvania placed, commercially speaking, alongside the iron deposits of Lake Superior, from which they are separated by 800 miles of land and water.

But precisely because the distances in Great Britain were small, it was here that the first attempts to annihilate them by mechanical means were made. To this cause we must attribute the growth of the iron trade having in the earlier period been so much more rapid than elsewhere. When the century opened the production of Great Britain did not exceed one-quarter million tons. Even thirty years later it was considerably under three-quarter million tons, and about half the total production of the world.

By 1830 the improved means of support had begun to tell, and the progress in the mechanical arts to place better implements in the hands of the ironmasters. A glance at the chronological table shows what was taking place and absolves me from a catalogue of events. The next twenty years raised the British output to two and one-quarter million tons, out of four and one-quarter million tons for the world. In the following twenty years Britain more than doubled her output, which in 1870 reached five and one-quarter million tons out of ten and one-half for the world. By this time the means of transport first adopted in Great Britain had spread to other countries. The distances separating ore and fuel in America, in Germany, and in France were becoming of less and less importance, and by 1870 the total production of these countries was only about a million tons less than that of Great Britain. Ten years later, the three countries together produced as much as Great Britain In 1890 she was called upon to yield the premier place to America. In 1903 Germany overtook her, and now, for the year 1905, which is the latest date to which we have complete statistics, the pig iron output of the world stands as follows:—

Country.	Tons.	Percentage of Total.
United States	23,360,258	42.7
Germany & Luxemburg	10,875,061	20.0
United Kingdom	9,608,086	17.6
France	3,076,550	5.5
Russia	2,715,063	5.0
Austria-Hungary	1,540,896	2.8
Belgium	1,310,290	2.4
Sweden	539,437	1.0
Canada	403,449	0.8
Spain	383,100	0.7
Italy	143,079	0.3
Other countries	655,000	1.2
Total	54,610,269	100.0

This enormous quantity may well fill us with surprise. Some fifteen or twenty years ago my father expressed to me alarm at the rapidly increasing output of iron, and doubted whether the powers of consumption of the world were equal to disposing of the huge mass of metal. In this he followed Scrivenor, who, in the preface to the 1854 edition of his "History of the Iron Trade," remarks on the increase from 1,300,000 tons in 1840 to 2,700,000 tons in 1852, and proceeds:—

"This did certainly appear a matter of sufficient importance to justify an inquiry—especially considering the striking events of the period which had elapsed—as to the causes by which this enormous increase had been encouraged, whether to the advantage of individuals as well as of the country, and whether the supply is likely to be supported, or, on the contrary, whether reckless make has not brought us to a position from which—unless mineral fields, at present unknown, come into operation, with similar advantages to the blackband ironstone of Scotland—we must retrograde . . . and reduce the manufacture to somewhat more moderate limits."

That these fears were in both cases unfounded the sequel proved. In 1854 Cleveland was just about to enter on the scene with a production which, in 1855, was under 100,000 tons, by the end of the decade was 248,655 tons, in 1864 was 409,106 tons, rose to 1,158,471 tons in 1874, and continued to grow till it reached 2,213,584 tons in 1900, and now (1906) stands at the estimated amount of 3,600,000 tons. Within the last twelve months we have seen the world short of iron and clamouring for more, the clamour taking a form which the manufacturers regarded with much complacency, for it resulted in a large increase in price.

And when we ask how the world, which a hundred years ago was content with considerably under a million tons of iron, to-day calls for more when we try to satisfy it with upwards of fifty million tons, the answer is not far to seek. The ingenuity of man was not exhausted when our grandfathers invented railways and steamships. Iron gives place to steel. The puddling furnace having served its purpose, is tossed aside for the Bessemer converter. An instrument with which the arduous labor of several men produced in twenty-four hours about two and one-half tons of malleable iron, is rejected for one in which the forces of nature, guided by human skill, gives us thirty tons of steel in twenty minutes. Iron, but sparingly used when the century opened, is demanded in continually increasing quantities to-day. The iron trade, responding to the call of the world, seeks new methods for producing still better results, and would seem to be about to reject the Bessemer converter for the open-hearth furnace. The remarkable invention of the regenerative furnac made fifty years ago is being continually perfected. Even now the great improvement of a continuous instead of an intermittent process is touched.

If we ask whence come these manifold perfectionments, we are led to look to another aspect of the question. Those to whom were due the great improvements which one hundred years ago were beginning to be effected were, on the whole, men who owed little to schools or colleges. "Self-made," as the expressive phrase goes, it was to their indomitable courage and energy that they owed success; to these and to that inborn perception of the possibilities presented to them which school or college seems to do nothing to create and little to strengthen. But the first barriers broken down, and the pioneers having shown the way, the carefully trained mind is needed to make straight the path. It must be admitted that we in this country have been disposed to neglect that careful training of the mind, and to rely on the native powers of insight more than on the trained intelligence. The workshop rather than the college was the technical school in Great Britain.

It is significant that in the chronological table we find a German Technical High School at Prague mentioned as being founded in 1806, that the Chausthal School of Mines comes next in 1810. Long before the century opened the School of Mines of Freiberg in Saxony was in existence, having been founded in 1765. In 1816 France appears on the scene with a School of Mines at St. Etienne. Belgium in 1836 contributes the School of Mines at Liége, and in the same year Spain that of Madrid, and Austria that of Leoben in 1840, while we have to wait till 1851 before the Royal School of Mines in London appears. Since then we have indeed given much more attention to this matter, and the air is filled with projects for supplying those educational facilities which our fellow-workers abroad possess in such abundant measure.

For as the tools in our possession become more complicated, we must be better trained in their use. The empiric skill of the native genius, where imagination stands instead of knowledge, gives place to the learning acquired by the patient student at the technical school, and science supplants art at furnace and in workshop. If we in this kingdom are to keep our place in the world of industry, we must be ready to make use of the changed methods as our grandfathers were ready in their day to avail themselves of the forces newly placed at their disposal. For we, as they, look out on a world of perpertual change.

The men who stood on the threshold of the nineteenth century would have been filled with astonishment could they have foreseen the changes it was to bring, giving us a world in which time and space are all but excluded from our calculations. A telegram with which we greet a distant friend in America reaches his hand hours before the sun has travelled westwards to mark there the same time as it marked here when our message was despatched. Jules Verne, by the exercise of his imaginative art, told us how with great good fortune his hero encircled the world in eighty days. With no trouble to ourselves beyond taking a ticket from a tourist agency, we could travel westwards from London till we reached this city again from East in a day or two more than half that time.

But let me picture to you one who, one hundred years ago, should have said to the most skilled and far-sighted man of that day, "Within a century from now corn grown on the western slopes of the Rocky Mountains will be conveyed by steam along an iron road to the sea coast, borne over the sea in a ship made of iron and propelled by steam, and sold in the London market cheaper than it can be grown in Essex." Not one of his anticipations would have been thought within the range of the barest possibility.

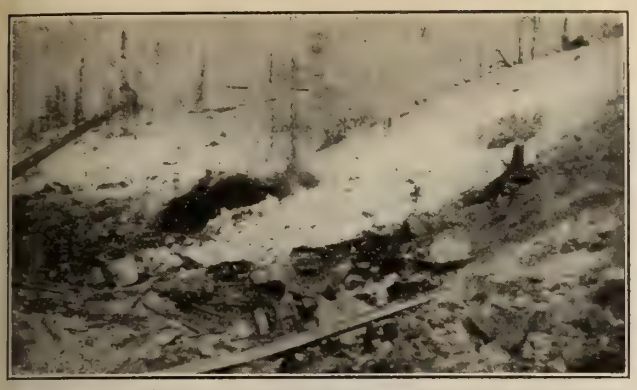
Beyond doubt we, who stand on the threshold of the twentieth century, may look forward to changes as great and far-reaching before the next hundred years are run out. New forces are again being placed within our reach. The ultimate possibilities of the electric current are not yet within sight, though, with the eyes of faith, we may guess at them. It may well be that the steam engine will be as obsolete as the horse gin before the twentieth gives place to the twenty-first century, and that the new machine will be in truth the heat engine towards which the first experimenters worked. Our views of the constitution of matter are in a state of flux, and though the highly abstruse questions involved in this may seem far removed from these technical questions which chiefly occupy us, they are no more remote than may have seemed the discovery by Oersted of the deflection of the magnetic needle by an electric current. Yet that discovery contained the germ of the electric telegraph.

And if I to-day look forward, as I picture that other man to have done a century since, what form might my guess of the future take? How in a hundred years will the great swiftly-gliding ship of those days be propelled? With little, or mayhap with no machinery on board, with barely any crew she speeds on her way drawn by the electric force generated at Niagara, and transmitted over the Atlantic by wireless telegraphy. She crosses to New York, takes her cargo, and returns as she came.

Strange as my forecast may seem, it is no more incredible than what has happened since 1807. The things which to us are commonplace would have been deemed impossibilities by our forefathers.

The world moves on in a succession of dreams and their fulfilment. The wild imaginings of one age become the splendid realities of the next, for

". . . all experience is an arch wherethro'
Gleams that untravell'd world whose margin fades
For ever and for ever when I move."



COBALT LAKE.

Cobalt Lake occupies an area of 51 acres in the heart of the Cobalt mining camp. The McKinley-Darragh location covers 3 1-2 acres of the southern end, and the remaining 47 1-2 acres are the property of the Cobalt Lake Mining Company, Limited. The company also owns a strip of 33 feet of land, half the road allowance, along the eastern side of the lake.

Early in the autumn of 1906 the Ontario Government announced its intention of selling to the highest bidder the mineral rights of Cobalt Lake. On November 22nd of the same year official announcement was made of the conditions of sale, and December 20th was set as the last day on which tenders would be received. The successful tender set the purchase price at $1,085,000. Of this amount about three-quarters was subscribed by an Ottawa syndicate, the remainder by Toronto and American capitalists. The whole amount was subscribed by about 670 persons. A marked cheque for $108,500 (10 per cent. of the purchase price) accompanied the tender.

A company was very rapidly organized, with an authorized capital of $5,000,000. Of this $4,000,000 was issued at once. Each subscribed to the purchase price received three shares of a par value of one dollar each, for each dollar of cash paid by him. This $3,255,000 allotment was made to the original subscribers. Brokerage and organization expenses amounted to $240,000. To provide for immediate development, $300,000 of treasury stock was issued. A considerable portion of this was taken up at 85 cents by members of the original syndicate.

During the latter part of the month of January, 1907, about one-quarter of the shore line was stripped. This work was necessarily unsatisfactory, on account of snow, ice and severe weather. In February, Mr. E. L. Fraleck

No. 4 Shaft Cobalt Lake, Beginning Sinking.

was placed in charge of the mining operations. Under his direction a force of 60 men continued trenching the frozen ground during the remainder of the month. Two veins were disclosed. North of the central part of the lake shore a smaltite vein two and one-half inches wide was disocvered, and a very high grade silver vein, about the centre of the shore line. The severity of the weather made continuous work impossible, but the results obtained by intermittent efforts were, at least, encouraging.

At present the entire shore line of the company's property has been partially stripped. On No. 1 vein a shaft has been sunk to a depth of 20 feet. On No. 2 vein, which consists of solid smaltite, varying from 2 to 6 inches in width, a prospect shaft has been sunk 40 feet. About 100 feet to the south of No. 2 an 18 foot shaft has been sunk of a 2 1-2 inch vein of niccolite, smaltite and calcite; and on No. 3 vein an 18 foot shaft has been put down. This vein is composed of solid niccolite and attains a maximum width of 18 inches. On No. 4 vein a shaft has been sunk to the depth of 80 feet. No. 4 carries good silver values and is composed principally of smaltite, niccolite and calcite, though considerable argentite, wire silver and occasional specimens of ruby silver have been encountered. On No. 5 vein a shaft has been sunk 80 feet. The vein varies from three to five inches and is composed of smaltite and native silver. No. 6, which is on the McKinleyDarragh line, has been sunk to a depth of 35 feet. It will thus be seen that a total of 291 feet of sinking has been performed, mostly by hand.

The shafts have a cross section of seven feet by ten in the clear, and are collared with a block skin to skin crib of hewn timber, affording a hoisting compartment five feet by five and a pipe and ladderway three feet by five. Below the collar the shafts are timbered with square setts in the usual way.

No. 4 Shaft Cobalt Lake, last week of February, 1907—Beginning Sinking.

In addition to these mining operations, the company has put up the following buildings:—

One cobbing house.
Two blacksmith shops.
One machine shop.
One oil house.
Compressor and boiler building.
Office building.
Eating and cook house.
Bunk house and stables.

All of these buildings are on the east shore of Cobalt Lake.

Two tubular boilers of one hundred horse-power each have been installed, and a fifteen drill cross compound air compressor will be in operation early in July.

Specimen of Niccolite Ore, Cobalt Lake, Showing Width of Vein.

Notwithstanding the depths attained in No. 4 and No. 5 shafts and their nearness to the lake shore, 23 feet in one instance and 15 feet in the other, it has not yet been found necessary to make any installation for pumping. No. 4 shaft, although it is over 70 feet below the water level of the lake, only makes about two barrels of water in a half-shift, and No. 5 about three barrels in the same period. These facts satisfactorily dispose of the apprehensions that water from the lake might be encountered in the early workings.

It is now the intention of the management to sink three main working shafts, one in the centre of the shore line, and one at each end. From these, when a suitable depth has been attained, the ground underneath the lake will be thoroughly prospected by means of drifts and cross-

No. 4 VEIN COBALT LAKE.

cuts. During the winter the lake was surveyed and laid out in in 66 foot sections. Soundings were taken at every 66 feet. It was found that the bottom of the lake is covered with a stiff clay, which will average a greater depth over the bottom of the lake than the actual depth of the water. This blue clay, it is supposed, will afford an impervious blanket, effectually preventing percolation, or seepage, from the lake into the underground workings.

The Cobalt Lake Mining Company has uncovered the continuation of the Nipising Cobalt vein, the largest cobalt vein in the camp. It has also struck the largest niccolite vein yet discovered. In addition to these, their three veins, Nos. 4, 5 and 6, are rich in native silver. Moreover, a continuation of the McKinley-Darragh veins into the lake may be counted upon. And all these do not exhaust the possibilities of the property. Most assuredly the property is well situated. It would be hard to pick out 47 acres in any other part of the camp, restrict the prospecting to a 33 foot strip and attain such results within a few months.

No. 5 Shaft Cobalt Lake, Middle of March.

At present the company has on hand 20 tons of niccolite, which averages 25 per cent. nickle and 5 per cent. cobalt; 12 tons of smaltite, averaging 15 per cent. cobalt. There are also 9 tons of first grade silver ore and a considerable quantity of second grade ore sacked and ready for shipment. This ore has been obtained from prospecting and development only. Drifts will be started out underneath the lake within a month. On Nos. 4 and 5 veins ore will be blocked out, and cross-cutting started to develope the niccolite vein at a depth of 85 feet. It is to be noted that the east shore of the lake shelves gradually towards the middle. This fact implies that at a depth less than that necessary to work safely under the lake, a certain amount of stoping can be done. In other words, a limited amount of ore can be blocked out and won between the shafts and the shelving shore at a depth of, say, 100 feet; while in all probability work cannot be commenced directly under the lake until the 150 foot level is reached.

Mr. D. B. Rochester, of Ottawa, is managing director. with office at the mine. Mr. E. L. Fraleck is the mine superintendent, and all the work so far accomplished has been arranged and caried out by him. The writer is indebted to both of these gentlemen for their kind assistance and hospitality.

THE MacMURTRY-ROGERS PROCESS

Continued from May 15th Issue.

Moreover, it seems probable that the small amount of water present near the zone of combusion aids materially in the desulphurization, acting in some way as a carrier of oxygen from hot material to the cooler material near the hot material; the effect being to slightly increase the quantity of oxygen present and so cause more rapid combustion, with consequent increase of temperature. To take the simplest case first:—

In the desulphurization of regule, if attempting to desulphurize this when dry and in a converter, very little action takes place; if water is added, metallic copper is readily produced. It was proved, in 1904, that this reaction takes place readily at a temperature just below the melting point of copper, as is evident from the porous structure of the product, which cannot have been completely fused.

Gautier* has recently observed this reduction of copper from cuprous sulphide by water vapor. but at a *white* heat; he formulates the reaction as:—

$$Cu_2S + 2\ H_2O = 2\ Cu + SO_2 + 2\ H_2.$$

This may possibly be the only reaction when only water vapour is present. When air is also blown in, sulphate of copper and oxides of copper can be shown to be formed in large quantities; these react with unaltered sulphide in the well-known manner. It seems also possible that some hydrogen peroxide may be formed thus:—

$$Cu_2S + 2O_2 + H_2O = Cu_2O + SO_2 + H_2O_2.$$

This hydrogen peroxide may quickly decompose at a lower temperature and give rise to a rapid evolution of heat at the point where it decomposes; owing first to the increase in the percentage of oxygen in the gas mixture at that point; and second, to the heat given out in the decomposition of the hydrogen peroxide. Any hydrogen formed by Gautier's reaction will burn higher up the charge and so transfer heat from the zone of combustion; some hydrogen appears to burn at the surface of the charge fairly long, and hot flames are seen above the hottest points on the surface.

The above conclusions have not, so far, been definitely proved, but have served very well as a working hypothesis. One can, however, be quite sure, from the nature of the product, that the ordinary reactions between oxides and sulphides and sulphate of copper can be carried out without melting these substances or the copper produced.

If the cuprous sulphide contains nickel sulphide, very little nickel is reduced, although both nickel oxide and sulphate are produced. In the ordinary reverberatory roasting process some nickel is reduced and a smaller amount in the bessemerizing of molten copper matte containing nickel. It seems to follow that the maximum temperature for the reactions—

$$2\ NiO + NiS = 3\ Ni + SO_2 \text{ and}$$
$$Ni\ SO_4 + NiS = 2\ Ni + 2SO_2.$$

is well above the melting point of copper; whereas the equivalent reactions with the copper compounds readily take place at slightly below this temperature. Steinhart has pointed out that it is not possible to reduce molten nickel sulphide by blowing air through it, as nickel silicate is produced.* In this process the nickel oxide and sulphate produced in the blowing operation readily form silicate when the product is melted down on a sand bottom, and give a slag with considerably more nickel in proportion to copper than is the case with the regule under treatment.

When a mixture of sulphides of copper and iron is treated, desulphurization proceeds rapidly if both water and silica are added, but not at all if either of these constituents is absent. Gautier states (*loc. cit.*):—

$$3\ FeS + 4\ H_2O = Fe_3O_4 + 3\ H_2S + H_2.$$

and also that

$$2\ Fe_2O_3 + 7\ H_2S = 4\ FeS + 3SO_2 + 7\ H_2.$$

when air is used in addition it is obvious that this hydrogen will burn, as also will the H_2S. It seems as if Fe_2O_3 is only a product of the reaction where the temperature is low. In a well-burnt charge of matte or ore, in this process. Fe_2O_3 is only seen at the side and top of the cake, that is where it has been cooled by radiation. If Fe_3O_4 is formed, one can understand that it readily parts with 1 atom of O, giving FeO—thus:—

$$Fe_3O_4 = 3\ FeO + O.$$

This atom of oxygen would help in the oxidation of FeS, and

$$FeS + O + O_2 = FeO + SO_2$$

The latter reaction would be very intense and may be a factor in heating up the particles to the point at which FeO and SiO_2 combine. This reaction is very important, and gives rise to a further evolution of heat, and any small portions of ferrous silicate formed will, in consequence, enhance the action in the neighborhood. In practical work, this formation of ferrous silicate and consequent sintering, can be seen extending outwards from the centres where the silicate formation first takes place. In this connection it is quite possible that water also acts as a carrier of oxygen by the alternate formation and decomposition of hydrogen peroxide, thus:—

$$FeS + H_2O + 2O_2 = FeO + SO_2 + H_2O_2$$
$$FeS + H_2O_2 + O_2 = FeO + SO_2 + H_2O.$$

and it seems possible that wherever oxidation takes place at a high temperature in the presence of air *and* water vapor, when the reaction requires an odd number of atoms of oxygen the other atom of oxygen from the molecule or molecules of oxygen will combine with water to form H_2O_2. This view has been brought forward by Armstrong and others in connection with the oxidation of carbon and carbonic oxide.

In the treatment of ore by this process the reactions involved are very similar to those occurring with matte, except that the passage of the zone of combustion upwards is preceded by the distillation of sulphur from pyrite and chalcopyrite. This sulphur must be allowed to escape to some extent, otherwise it interferes with the progress of the reaction by forming. a viscous layer of ore and molten sulphur. With both ore and matte charges the time factor is very important.

The reaction must proceed so rapidly that, at the zone of reaction, a sufficiently high temperature is kept up for the formation of ferrous silicate; otherwise ferric oxide is formed and decreases the amount of active oxygen in its neighborhood, when a diminution of temperature takes place, and causes a patch of unsintered material to be formed. If much Fe_2O_3 is formed at any point it does not appear possible to reduce it. The formation of ferrous silicate aids very materially in getting a product low in sulphur, as well as in sintering the material; for it probably acts as a carrier of oxygen to any particles of ferrous sulphide that may be originally included in it.

*Abstracts Jour. Chem. Soc., 1906, p. 548.

*Trans. Vol. XV., p. 233.

THE VALUE OF A MINE.

By J. B. Tyrrell, Mining Engineer, Toronto, Ontario.

What is the value of a mine? Probably most people to whom this question would be put would simply answer: "Just what can be got out of it."

But let us suppose that the purchaser is guided by rational business principles, and that he is buying a mine, or stock in a company owning a mine, as a good permanent investment.

In deference to prevailing conditions it will be assumed that the mine under consideration is owned by a joint stock company, and that the shares in this company can be purchased freely on the stock market.

The first point to consider, then, is how much money will the mine yield in dividends; and this is dependent on a number of conditions, such as:

1. How much marketable ore does it contain, or can be extracted from it? 2. How much will it cost to extract this ore? 3. What is its value at the mouth of the shaft? 4. What is the value of the plant and property, after all the ore has been extracted?

These are questions that the mining engineer must answer to the best of his ability. But after they have been answered as well as possible under all the known conditions, the further question remains to be answered: What is the present value of the property when a rational estimate has been obtained as to what dividends may be expected from it? It is to this latter question that some attempt will here be made to offer an answer.

It is probable that the majority of men who purchase shares in mining companies regard them in very much the same light as shares in other companies, with the added attraction of unknown possibilities in the form of new but usually very improbable discoveries of pockets of rich ore. The fact that investments in these two forms of companies are inherently different is generally disregarded.

Stock in transportation companies, banks, loan companies and industrial enterprises, if the companies are properly managed, may be expected to increase in value from year to year with the natural and regular growth of business. Thus, a company whose stock was worth par ten years ago may easily be worth 2 to-day, and ten years hence, with the natural enlargement of its business, it may be worth 4. For instance, stock in the Canadian Pacific Railway is worth four times what it was twenty years ago, even though additional stock has been issued to the shareholders on favorable terms in the meantime, and with the natural growth of the country the traffic and general business of this railway must still vastly increase, and the stock will become of still greater value.

Industrial enterprises might be cited to the same effect. The manufacture of agricultural implements has greatly increased in the past twenty years, and stocks in the manufacturing companies have correspondingly increased in value. There is no reason to suppose that the limit of this increase has been reached or approached. In fact there is every reason to believe that the value of these stocks will continue to increase with the continued increase in the volume of business.

But mining investments to be successful must be made on a different basis. Instead of increasing the mine is decreasing in value with every ton of ore taken from it, and the company owning it is living or deriving its profits in the using up of its capital.

When a man invests in railway or industrial stocks he feels that in the ordinary course of events and with the normal growth of business the value of his stock is sure to increase, so that when he wishes to sell he can get a little more than his original capital back again, and he consequently feels satisfied with a rather low rate of interest. He also feels that both his capital and interest are reasonably secure. There is no thought taken or no provision made for getting the capital back in a certain number of years, for the enterprise is intended to be carried on indefinitely.

A mine, on the contrary, not only decreases in value year after year as the ore is extracted from it, but production will cease altogether after a certain number of years, for the life of a mine is usually short. Dividends will then be things of the past. The investor in mining stock is therefore confronted with this condition, that he must look for the return of his capital along with proper interest on it within a limited number of years. Any investment in mining stock which does not provide for such repayment of capital is certain to be disastrous to the investor in the end. The dividends must include a sinking fund to replace the capital and interest at a rate commensurate with the risk incurred.

When this principle is thoroughly understood that dividends of mining companies must provide for the redemption of capital, as well as for payment of interest, the next questions that present themselves and the demand answer are: How many years should be allowed for the repayment of the capital, and therefore what percentage of it should be repaid each year in the dividend? And in addition to this, considering the possibilities of failure of the enterprise altogether, what interest should be looked for on the investment?

NOTES ON THE MINERAL FUEL SUPPLY OF CANADA

By R. W. Ells, LL.D.

(Abstract of paper read before the Royal Society of Canada.)

(Continued from Page 212.)

The carefully detailed work of Mr. Hugh Fletcher has revealed the existence of a possibly important coal basin southwest of Springhill, along the north flank of the Cobequids. A coal seam was struck by boring, at the depth of 2,000 feet.

Small seams, such as those at Debert, outcrop on the south side of the Cobequids in formations other than the productive coal measures.

The Province of Prince Edward Island does not show the presence of any coal seams. Since all the rocks of the island are Upper Carboniferous or Permian, coal if existing at all, must be sought for at a great depth. There are, however, several peat bogs of excellent quality.

In New Brunswick the Carboniferous rocks have a very wide distribution and comprise an area of more than 10,000 square miles. At many points throughout this area thin seams outcrop, and near the upper end of

Grand Lake, where the coal appears to have the greatest thickness, it has been mined for nearly a century. The main seam is 20 inches thick; but in places where two seams unite a thickness of two and one-half feet is observed. The annual output amounts to about 40,000 tons. Boring operations have been carried on throughout the coal basin for over sixty years without finding any seam better than this.

At various points in New Brunswick, outside the limits of the principal coal basin, small seams of coal are found, some of which belong to a different horizon. Among other sources of fuel supply in this Province must be mentioned the Albert shales and the associated mineral, Albertite. Rich beds of oil shale, styled Cannelite, also occur as interstratified beds in the mass of this shale. The Albert shale formation has a thickness of over 1,000 feet. The strata are usually highly inclined, and there are numerous faults and occasional overturns. The Albertite occurred in the mass of this shale near the axis of the anticline, as the filling of a true fissure having a width varying from a few inches at the ends to about seventeen feet in the centre, decreasing in depth to the bottom of the deposit about 1,500 feet from the surface. The vein showed several faults, the mineral being thrown from side to side. It was mined to a depth of over 1,200 feet, when it assumed a brecciated structure, fragments of shale being cemented by the Albertite. These shales are regarded as of Devonian age.

Massive bands of grey and black oil shale from three to twenty feet thick, interstratified with the bituminous shale, yield from thirty to eighty gallons of oil per ton. They are readily inflammable, and though the ash is very high (45 to 60 per cent.) they evolve a great heat. In ease of extraction and in percentage of oil contained, these shales are superior to those mined in Scotland. The main vein was worked for twenty years. It yielded 204,000 tons before exhausted.

Comparing the beds of Cannelite with true cannel coals, it may be remarked that with the exception of the large amount of ash in the former there are strong points of resemblance. The associated Albertite is a highly altered petroleum, analysis showing the merest trace of ash.

Coal does not occur in Quebec in commercial quantities, but the development of the peat industry in this Province. as well as in Ontario, bids fair to furnish for certain purposes a fuel which will to some extent supply the absence of beds of true coal. The development of the peat bogs in the country between St. Johns and Farnham, and also near Bulstrode, Arthabaska County, was begun about forty years ago. Being uncompressed, the peat was not suitable for railway work. But now peat, after extraction of the contained moisture down to 12 or 15 per cent., is compressed into small cylindrical blocks having almost the hardness and consistency of coal. Peat bogs are extensively developed in many portions of the Province, and the manufacture of the compressed fuel has reached the stage where the demand exceeds the supply, and it readily sells at a good profit on the cost of manufacture.

In Ontario true coals are nowhere found; but deposits of anthraxolite and lignite occur, the latter in large quantities in the area south of James Bay. This lignite of the Moose River basin is found in Post Tertiary deposits of sand gravel and boulder clay, instead of in solid rock formation, as is the case with the lignites of the west. The seams are of considerable thickness and the lignite when dry burns readily. It is of brownish-black color, and burns freely in an open fire. It cannot, however, compare with the Tertiary lignites of the west. The lignite and peat deposits have not as yet affected the importation of coal.

Petroleum was first discovered in Ontario in 1860. The subsequent finding of immense quantities of natural gas added largely to the light and fuel resources of the Province. The original field from which Ontario petroleum was first obtained is still a producer, though the supply in recent years has materially decreased. The discovery of natural gas about fifteen years ago in the place where petroleum was first known, and later in the Niagara Peninsula, has largely affected the coal consumption in some districts. Not only have local requirements been met, but immense quantities of gas have been piped to Buffalo and Detroit, on the American side.

In the western half of the Canadian section, beginning with the great plain of Manitoba and extending across to the shores of the Pacific ocean, many of the rocks over large areas comprise Cretaceous and Tertiary sediments. In these the greater part of the coals of the western division are located. In Manitoba and throughout the great plains east of the Rocky Mountains, and extending northward down the valley of the Mackenzie River to the Arctic Ocean, the rocks are largely of Cretaceous age. The district is underlaid in many places by large beds of lignite. Outcrops are seen as far east as Turtle Mountain in Manitoba; and along the North Saskatchewan as far as Victoria these lignites are seen, sometimes in beds of great thickness.

Passing west into the foothills of the Rockies, as at Banff and as far south as Crow's Nest Pass, the lignites change their character and pass into lignitic coals, bituminous coals and anthracites. Of this wonderful series of coal beds, which at Crow's Nest is 200 feet in thickness, many seams are large and of superior quality.

(To be Continued.)

The Hon. the Minister of Mines has authorized the preparation of a report on the mining and metallurgical industries in Canada, embodying the following information: Name of company, date of incorporation and charter, authorized capital, value of shares, directors and officers, head office, Canadian office, number of men employed, wages, transportation facilities, market and prices. The following additional information is sought regarding the mining industry: Mining land owned and controlled, class and character of ore mined, average quality of ore(analysis, method of mining, treatment of ore, if any cost, cost of mining, drilling, explosives, hoisting, transportation, general expenses), total cost per ton of ore raised. For the metallurgical industry the following information is asked: Location of plant, ore treated, quality of product. method of treatment, description of machinery and apparatus used, source of supply of raw material, composition of raw material, cost of production. It is proposed to report only upon producing mines, mines under development and established metallurgical plants. The present rapid progress in and the changing conditions regarding such factors as labor, market and prices will necessitate supplementary annual publications to bring the information of the original report up to date until the changes and new material call for the issuance of a complete new report.

THE COBALT MINING DISTRICT.

By Dr Robert Bell, F.R.S., Ottawa, Ont.

(Toronto Meeting, 1907.)

In the present paper the writer proposes to confine his remarks mainly to some points in connection with the geology of the Cobalt district and the nature of the metalliferous deposits, the most important of which are those of silver.

The silver-bearing area is comparatively small, the most productive portion, so far as known, not exceeding about fifteen square miles, although fresh discoevries are being made, some of which tend to increase the area. The general appearance and the physical characters of this area are similar to those of the region which surrounds it for many miles. It is an undulating, rocky, forest-clad district, with numerous small lakes among the hills, which latter are not high or conspicuous, the general aspect, on the large scale, being that of a mammillated peneplane.

The centre of the productive area is about three and a half miles west of Lake Temiskaming, in latitude 47 degrees 30 minutes. The rocks within the above fifteen square miles belong to the series, all of which was formerly called Huronian.

A few words of explanation may here by advisable in reference to the history of the Huronian system, and the evolution and nomenclature of the divisions which are now more or less recognized by geologists. It is well known that some sixty year sago the whole of the upper series of the azoic or archaean was called Huronian. This was before discovery had advanced sufficiently or geologists had had time to properly classify and sub-divide the great series of crystalline rocks overlying the Laurentian, which Logan and Murray had already found in the region of Lakes Huron and Superior.

It required much time and labor to ascertain the general nature, the importance, the geographical extent and distribution, the volume and the probable natural divisions of the system. While the whole series may be described as of a pyro-clastic type, an igneous character prevails towards the base and the sedimentaries become more and more abundant and diversified towards the top. The underlying igneous type has been called the Keewatin division, while the term Huronian has always been applied to the higher portions, and this may be again separated into the lower and upper Huronian, although no continuous dividing line has been established.

One of the characteristics of the Huronian proper is the want of continuity of any particular belt or division. The lithological divisions which may exist in one district all thin out and terminate in both directions, and gradually become interlocked or dovetailed with new formations which gradually introduce themselves from both sides. In other words, a general cross section of the Huronian, covering a considerable distance, would show a series of interlocking lenses of different rocks, which are gradually replaced on the strike by other kinds. For this reason an identity or difference in any set of these rocks in widely separated localities is no criterion as to a ismilarity or a difference in age.

The recognized Keewatin rocks of the Lake of the Woods lie at a distance of seven hundred and fifty miles in a straight line from the Cobalt district, and the two formations have not yet been separated from each other in any part of the intervening distance, in the course of which the Huronian areas are broken up and separated by wide intervals of the Laurentian. Too much stress, therefore, should not be laid on differences of age which are supposed to exist among the rocks of the Cobalt district. It may be better to defer an exact separation and classification until some general work in this line has been done over this great interval and until this whole subject is better understood. It is worthy of notice that some persons who make frequent use of the word Keewatin apparently believe that it is a lithological term, like conglomerate, diorite, slate, etc., and could point out where a few yards of it might be seen. The writer should here observe that he has done no work personally in the way of mapping out and classifving the rocks of this district, and as the geologists who have been engaged upon it do not agree, it might be better for the present to confine our geology to making as correct a petrographic map as possible, which is all the prospector or the miner requires, and leaves the classification to be determined later on.

The silver-bearing rocks have so far been found to consist of massive or crystalline diabase, but more especially of a volcanic breccia or agglomerate having a bluish and grayish matrix consisting of hornblende porphyrite, while the contained fragments are mostly reddish and grayish granite, together with others of the porphyrite itself and various forms of greenstones. The fragments are generally of rather small size and mostly angular or subangular, although in some parts many of them are more or less rounded. They stand at all angles in the mass and are very irregularly distributed; sometimes well scattered throughout considerable volumes of the rock, sometimes occurring in large and small bunches or "flocks," or they may be sparingly distributed or almost entirely absent. This agglomerate has a general horizonal attitude and is the rock which is most in evidence at the surface in the more productive parts of the district. Associated with the two kinds of rocks which have been mentioned are fine-grained drab and gray slatey rocks and dark and light colored greywacke, passing into impure quartzite. These also lie horizontally or conformably with the great sheet of brecciated hornblende porphyrite.

In the Cobalt district itself, the brecciated rock extends beyond the silver-bearing area and the same breccia occurs abundantly on Lake Temagami, around Rabbit Lake, and in other parts of the region, but holding little or no silver, as far as known. The presence of the silver at Cobalt would therefore appear to depend upon an original local impregnation of the parent breccia and diabase with the metal. It would therefore appear to be a mistake to suppose that silver is to be looked for wherever the breccia is found. The occurrence of the silver in the Cobalt district appears to be regional and to be confined (with some exceptions) to a comparatively small area. This is not the only example we have of these local occurrences of a certain metal. The great abundance in this same locality of the hitherto rare and expensive metal, cobalt, affords another example of this phenomenon. The immense deposits of nickel, within a very limited area at Sudbury and in New Caledonia on the opposite side of the planet, belong to this mode of occurrence. In various parts of the world, some of the other metals, such as tin, mercury, platinum and manganese, exhibit the same tendency to regional limita-

ion. Only the other day it was announced that the hitherto rare metal tantalum had been found in great abundance at a single spot in Australia The cause of this local or circumscribed occurrence of certain metals has not yet been explained, any more than the reason why the specific gravity of the whole earth is more than twice as great as that of the average materials which form the crust. The latter fact is probably owing to the existence of various heavy metals at great depths and the former to the occasional ejection of one or more of these from great depths, especially during early periods of the earth's history.

Some of the shafts in the Cobalt district have been sunk in the agglomerate and the associated slatey ash rock and arkose, and this rock formation is supposed to have a total thickness of upwards of three hundred feet. It is traversed by two sets of vertical joint planes, recalling the jointed structure of argillites, clay slates, etc. One of these sets has an average course of northeast southwest and the other is at right angles to this. The silver-bearing part of the district is also traversed by fissures or planes of disturbance, along which, from time to time, the rocks were crushed by slight movements, under great pressure, forming spaces in which mineralizing waters could rise from considerable depths. The agglomerate and perhaps the whole of the crust of the earth to the very surface would probably have an elevated temperature at that time, while the waters from a depth would be still hotter. On approaching the surface they would be relieved of pressure and somewhat cooled.

The reason why some mining men, on visiting the district in the earlier days, did not appear to be favorably impressed, seems to have arisen from the fact that nearly all the veins were small; few of them were well marked or continuous for any considerable distance. In fact, most of them lacked the typical character of good fissure veins of the ordinary kind. When development had proceeded far enough and a sufficient number of openings had been made to enable one to properly observe the phenomena, it became evident that the supply of ore did not depend upon the individual small veins, but that there was some more general kind of mineralization. This the writer believes to be connected with the above planes of fracture or disturbance which are more continuous and deeply seated than the small individual veins on and near their course. The fisure plane may, in places, be indicated by only a small vein or a dry fault without any vein matter or gangue, but the wall rock itself along such sections of the general rent will often be found to be rich in silver for some inches or even a foot or two inward from the line of fracture. Small cracks and branch veins running out from the main fissure may carry the silver to a great distance into the country rock.

If the above view be correct, a continuous production of the silver is to be looked for by following these vertical zones of crushing and disturbance. Among these planes, the temporary formation and subsequent breaking up of veins, from time to time, was only one of the phenomena of their history. In some instances especially where the line of fracture has been nearly straight, the vein or group of veins has not been thus broken up, but has preserved its contiuity for some distance and has become enlarged or has produced new parallel veins by widening of the fissure. La Rose vein or group of veins appears to be of this character.

On the other hand, there are usually many minor irregularities in both the horizontal and vertical course of the lines of dislocation, and at any new movement of the walls there would be a fresh breaking up of the materials which had accumulated along these lines and new spaces would be found for further mineralization. This repeated brecciation has resulted in what we now see in the "mines" opened on these lines of disturbance. Both the vein matter and the wall rock are much split and broken up; dislocated fragments are cemented together along lines of small faults and there are many miniature horses surrounded with the cementing gangue. Secondary dislocations, branching from the main one, are often rich in silver, which may also penetrate into the shattered wall rock and form a body of rich ore, even if the vein matter be of inisgnificant amount or altogether wanting. The foregoing explanation of the formation of the mineralized zones and of the mode of occurrence of the silver in the Cobalt district was given in the writer's report on the district, published in the Summary Report of the Geological Survey for 1905.

The volcanic nature of the fragmental rock of the Cobalt district is manifest both in fresh fracture, and on every weathered surface. One of the localities where this is particularly convincing is the south-facing slope of the hill near opening 12, 13, 15 and 21 of the Nipissing Mines Company and not far from the power house at the shore of Peterson Lake, on lot R. L. 404. Here the rocks have been well exposed by recent hydraulic washing and show very distinctly their volcanic or plutonic character. Areas of different varieties of diabase and agglomerate are mixed together and cut by dykes which have evidently been formed before the masses which they traverse had been completely hardened by cooling. At the contact, some of the dykes became amalgamated with the rocks they penetrate and have no sharp line of division. The smaller dykes are in some instances broken and interrupted, as if by the movement or flow of the semi-fluid mass into which they had been intruded. The weathered surfaces of different adjoining small areas of the diabase present different shades of color and different degrees of texture. Some of the brecciated parts show large inclusions; some are irregularly charged with the brecciated debris, while other parts are quite free from it. A cherty rock, having lines of foliation, is associated with the foregoing. A few small veins containing smaltite and argentite traverse the diabase and the agglomerate at this locality. Lines showing limited faulting or dislocation also occur in these rocks.

Up to the present time, twelve or more different metals, either native or combined with one another or with other elements, have been found in these rocks, and this fact alone would point to an igneous rather than a sedimentary origin of the matrix.

In connection with the supposition that some of the rocks of the Cobalt district may be co-related with those which have been called Keewatin, at the Lake of the Woods, and the unfounded theory that the Keewatin rocks are not argentiferous, the fact may be mentioned that the leading feature of these Lake of the Woods rocks is the prevalence of greenstones, having a concentric spheroidal structure. On the Lawson property, which lies immediately southwest of Kerr Lake, the writer found, near the centre of the lot, an exposure of a dark greenish gray, rather fine-grained diabase, having a conspicuously concretionary structure. The sections of the spheroids are nearly circular and vary from six inches to three feet in diameter, the average being two feet. This rock is here cut by a well-defined vein of smaltite with silver, and several other silver-bearing veins occu rin the immediate vicinity.

The foregoing opinions as to the Cobalt district have

not been formed as the result of a single visit to the camp, but have been gradually matured by five different visits to the district. There is a great advantage in paying repeated visits to any locality of geological interest. In the intervals between examinations one has time to think over what he may have seen and to consider points on which he requires further evidence in order to clear up uncertainties or doubts.

EXCHANGES

The Coal Trade Journal for June 5th contains a leading editorial "The State of Trade."

The Mining Journal, June 1st, contains its usual valuable summary of the world's doings in mining.

The Maritime Mining Record, June 12th, opens with a short paper on "Coal Dust," which discusses the explosion of coal dust, in the absence of fire-damp.

The Journal of the Franklin Institute for June contains a paper on "Change of Structure in Iron and Steel," by W. Campbell, Ph.D., of Columbia University.

The Iron and Coal Trades Review, May 31st, takes up "Coalite," the new smokeless fuel. Apparently "Coalite" has failed to substantiate the claims of its promoters.

The Iron and Coal Trades Review, June 14th, devotes a page to the new fuel, "Coalite." The analysis of "Coalite" is stated to be: Carbon, 80.00 per cent. volatile matter, 12.00 per cent.; sulphur, 1.00 per cent.; ash, 7.00 per cent.

In *Fuel* for June 11th there is an article on the application of Texas lignites to the production of power by producer gas methods. It is stated that a ton of lignite will produce 90,0000 cubic feet of gas at a delivered cost of not more than 1 cent per 1,000 feet.

In *The Mining World,* June 22nd, Ralph Stoke continues his article on "The Tasmanian Tin Industry." A third paper on "British Columbia Placers," by Horace F. Evans, gives evidence of very intimate acquaintace with the alluvial gold deposits of that Province.

In the Mining Reporter, June 6th, C. C. Lane writes of "The Development of Chilian Mills." Of the Chilian mill the writer says: "When stamps reduce to one-quarter inch they can be credited with three-eighths of the duty, and the Chilian mill is entitled to a credit of five-eighths.

The Engineering and Mining Journal, June 8th, opens with a strong article on the "Metallurgy of Aluminium in 1906" The writer is Professor Joseph W. Richards. He states that the capacity of aluminium reduction plants will be enlarged very considerably during 1907 and 1908.

The Colliery Guardian, June 14th, contains another instalment of "Evidence Taken Before the Royal Commission on Mines." Watering of coal mines to obviate coal dust explosions was the subject of a great deal of the evidence taken. In a certain Welsh colliery the actual cost of watering was 1.72 penny per ton. This included the cost of all fixtures, etc., and of hauling water in tanks.

The Mining Journal, June 15th, in commenting editorially upon the Indian Geological Survey Report for 1906, notes that there is in India "a disposition to turn to the mineral occurrences promising the requisite raw material for the creation of local industries, for the success of which the great home market and abundant cheap labor afford good prospects. Such a result, while satisfactory to the country, is bound to diminish the interest felt by European mining capital in India."

The Mining and Scientific Press, June 8th, has an article on "Acid Flotation Processes at Broken Hill." The Broken Hill ore assays 16 per cent. lead, 15 per cent. zinc and 11 ounces of silver. Formerly only 65 per cent. of the lead and between 45 and 50 per cent. of the silver were saved. A recovery of 80 per cent. is now possible. The ore consists of an intimate mixture of galena, blende, rhodonite, garnet, quartz and calcite.

The Engineering and Mining Journal, June 22nd, opens with a very interesting account of the "Medical Department of the Colorado Fuel & Iron Company." This company maintains, besides the magnificent Minnequa Hospital at Pueblo, with accommodation for 210 patients, a dispensary at the Minnequa steel plant, two emergency hospitals in remote camps and dispensaries and resident surgeons at all its properties.

The Mining Journal, June 8th, in a capable editorial takes up the annual report of the Egyptian Department of Mines. An excerpt from the report speaks thus of blanketing: "The large concessions that exist in the hands of a limited unmber of people incapable of developing them still form a big obstacle to the opening up of the country. However, by the end of 1907, nearly all of them terminate, and it is anticipated that considerable local interest will then be taken."

The Mining and Scientific Press, June 15th, in a vigorous and characteristically incisive editorial on "The Trial at Boise," discusses the "orgy of brutality" which led up to the trial. "We venture to attribute it, as we attribute many other ills from which we suffer, in the very midst of a triumphant industrial progress, to the absence of a strong public opinion in support of the law." Any excerpt fails to reveal the strong, judicial spirit of this editorial. It is most worthy of careful perusal.

South African Mines, Commerce and Industries for April 6th demonstrates the advantages accruing to the users of the tube mill as an accessory to the stamp mill. The manager of the Rand Mines group reports that the 23 tube mills employed by the mines under his charge have increased the duty per stamp from 5,170 tons per day in 1905, to 5,672 tons in 1906. The extraction was increased from 89,877 per cent to 93,858 per cent. The reports of individual companies of the Eckstein group confirm these figures.

The Science and Art of Mining, June 15th, gives the first instalment of a very interesting article on "Coal Mining in the United States." The writer's point of view is British. "The only sphere in mining in which they (Americans) surpass the British is in the use of mechanical coal-cutters." Referring to haulage, the article continues to this effect: "Haulage is mostly accomplished by mules and electric and compressed (air) locomotives, very few endless ropes or main and tail rope installations being at work. Mule haulage in small mines may be cheaper, and for the time being efficient, but in a large mine mules are nothing but a costly nuisance . . . In the State of Illinoise alone, and it is typical of the Republic in this respect, 80 per cent. of the mines use all mule haulage . . . At some of the mines the treatment of the mules is cruel and inhuman."

Canada' Mineral Exhibit at the Dublin International Exhibition.

(Contributed.)

The mineral resources of Canada are graphically illustrated by the mineral exhibit in the Canadian Pavilion, in connection with the Irish International Exhibition, now being held in Dublin, and are a source of great interest to a number of European mineralogists in attendance at the big Irish Fair.

Geological and mineralogical authorities who were studying the Canadian mineral resources agree with the Canadian authorities that the mineral wealth of Canada, up to the present located, is small in proportion to the value, variety and number of deposits that remain to be discovered, and are not surprised that every year a new crop which makes individuals rich and adds to the general wealth of the nation is discovered, sufficiently important to arouse the interest of the world.

The discovery of gold in the Yukon, in 1897, the immense wealth of silver at Cobalt, in Northern Ontario, and likewise the deposits of the gold, silver, copper and immense quantities of asbestos at Chibougamoo, in the Province of Quebec, have set the European students of mineralogy thinking.

The mineral exhibit in the Canadian Pavilion at the Dublin Exhibition is quite large and comprehensive. There are 1,049 different exhibits, including a large display of cobalt, nickel, arsenides and silver ores of Ontario, together with asbestos, mica and corundum, which are the chief exhibits. There are fifteen exhibits of the manufactured products of corundum selected from the industrial centres of England, France, Germany, Belgium, Russia and the United States, that use the corundum ore, and goes to demonstrate its general use. In fact, all the Canadian ores are well represented.

CANADIAN MINERAL AND METALLURGICAL EXHIBIT—DUBLIN.

The exhibit also contains Canadian anthracite and bituminous coal. Building and ornamental stone are

very complete, with special interest taken in the display of granites. The gold exhibit in quartz and dust, from the Yukon, British Columbia, Quebec and Nova Scotia, represent 125 specimens that show the wealth of the country. An exhibit of pig iron produced by the Electro-Thermic process is very interesting to the European scientist, and shows the great possibilities in the iron ore deposits of Canada.

CANADIAN BUILDING—IRISH INTERNATIONAL EXHIBITION, DUBLIN.

CANADIAN MINERAL EXHIBIT DUBLIN.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay, 10th June, 1907.

The Dominion Coal Company have just acquired a Dräger breathing apparatus, and are purchasing nineteen more, making an equipment of twenty sets, with the various oxygen cylinders, refill pumps, and the necessary accessories. Their intention is to erect a rescue station on European lines, and they will train men in the use of the apparatus. This is, we believe, the first modern apparatus of this kind that has been imported into Canada for use in mines. (A full description of the apparatus is to be found in the issue of this JOURNAL, dated 15th April.) The matter of the provision of life-saving apparatus of this kind is at present engaging the attention of a Royal Commission in England, and very recently the United States Government sent over a representative to study the German and French stations on the ground. There is without doubt a pressing need for some such provision in the mines of this continent, and the Dominion Coal Company are to be congratulated on their wise initiative. Many lives have already been saved in European mines by the use of breathing apparatus, and although at the memorable catastrophe of Courrieres the Westphalian Rescue Corps arrived too late to save any lives, yet they rendered very valuable assistance in reopening the mines and removing the dead. Since then breathing apparatus of several types havs been used in mine explosions, and one doubts whether any modern mining company can afford to be without them.

The work of reopening the Hub Mine is progressing satisfactorily, in spite of the delay which has been occasioned by the destructive nature of the mine water. The mine is being cleaned up underground, and very little damage appears to have resulted from the flooding. The fire affected mostly the upper workings, which are old and practically exhausted, and did not travel to the deep. It is hoped that hoisting will be resumed towards the end of August. The surface erections are rapidly nearing completion, and the re-screening plant for the central banking station is already in operation. Considering that the fire made a clean sweep of all the surface buildings, with the exception of the boilers, the Coal Company's officials are to be congratulated on the expeditious manner in which they have gone to work.

At Reserve Colliery also the new bankhead replacing the old structure that was burnt to the ground last October is in operation, and is a very decided improvement on its predecessor, which was one of the things that "just growed," and looked it.

The new shaft to the Emery Seam is also completed, and hoisting coal. This mine has now 500 feet of longwall face, and is putting up about 500 tons per day.

Having now got rid of the ice blockade, which so restricted operations in Cape Breton during the month of May, the Dominion Coal Company, along with all the other operators in the Island, are being hampered by the disinclination of their workmen to descend the mine after pay day. This condition of affairs appears to be getting worse, and augurs badly for the output during the "picnic season." How serious a drawback this habit is to the mining companies may be gauged from the fact that during the week preceding the pay day of the first of June the average output of the Dominion Coal Company's mines was 14,800 tons daily, whereas in the week following the pay day it dropped to 12,600 tons. This means a dead loss of tonnage to the operators of at least 20,000 tons a month, a very serious matter when the limited season of navigation is taken into consideration, together with the fact that the fixed charges of the mine and the organization necessary to produce the larger tonnage is in no way reduced to correspond with the post-pay-day yield. What the remedy is for this state of affairs is not at all clear, but that a remedy is needed is very obvious. This is further a reduction in wages that the Provincial Workingmen's Association might well take under advisement, as 20,000 tons per month additional output would mean quite a little in the pocket of the Cape Breton miner.

STELLARTON.

How easily some folk allow themselves to fall into the blues! Any temporary impediment to their progress sends them to the verge of collapse. The backward drop of the shipping season led some to give utterance to the belief that we had lost so much in coal shipments, that 1907 would show a falling off. It will need a good deal more than a week or two's lateness to supply sufficient ground for any such belief. We have been told, for instance, in the papers that the unfavorable weather conditions mean a loss in shipments to the Dominion Coal Company of some two hundred thousand tons. Nonsense. One cannot judge from the shipments of five months what the year will bring forth. Let me take a glance at the shipments of the Dominion Coal Company for the first five months of seven years, and see what they declare. The smallest shipments in five months for seven years were in 1905, when only 824,000 tons were shipped. The heaviest shipments in the first five months of any year was in 1903, when the large quantity of 1,111,700 tons were shipped. And yet what happened before 1905 was out? Though handicapped by short shipments in the first five months of nearly 300,000 tons, it beat 1903 by over 100,000 tons. The shipments for the five months of 1907, of the Dominion Coal Company, are 68,000 tons behind; but if 1905, badly behind, beat in the long run its predecessors, why not a similar thing happen again? The coal trade is a peculiar business. It is stated that some of the managers are eagerly on the lookout for new customers, while they have booked more orders than they can, to use a common phrase, "Shake a stick at." How is this, I wonder? The reason presumably is that though the managers are at times very neighborly bodies, each is careful that the other does not get ahead in any way. Our managers are good fellows; yes, and diplomats to boot. When in meeting all are chivalrous. Not for worlds, for the life of him, would one hint that some other had been poaching in his precincts. After the meeting, however, one or two, it is said, give relief to their feelings in a foreign language. This may be idle rumor only. I believe the I. C. R. contract will not be awarded, as expected, in the beginning of July. It is hinted that some of the agents of the Coal Companies have asked for delay.

Scarcity of labor is still the cry at many of the collieries, though a few immigrants are dropping in occasionally. Skilled labor is not quite so scarce as unskilled. A large proportion of the skilled labor which finds its way into Nova Scotia from Britain does not, it seems, easily adapt itself to conditions in this country. Many men after being a time in the country hie away to the United States, where they think work is easier and the conditions similar to those to which they have been accustomed. At some of the mines it takes an old countryman fully twelves months to cut as much coal and as easily as a native born. We will never have again in Nova Scotia a sufficient supply of native labor to meet the increasing requirements of our mines. Therefore we shall be forced to look abroad. From what I had read in the United States papers, I had come to the conclusion that it might be as well that the progress of the coal trade be retarded, than that it be furthered by the importation of Huns, Poles, Slavs, etc., as in the United States. I have since, however, been induced to believe that the men of Poland are not a bad lot when rightly treated. It is said they are more amenable to the discipline of the mine than natives. Their ignorance of our ways and of our language may lead them into serious faults, as was the case the other day, when two Belgians were found quietly smoking their

pipes in a mine in which safety lamps were in use, and, of course, pipes prohibited. But the poor fellows did not know they were breaking a law. Their offence was overlooked, and yet what might it not have led to? As remarked in the *Mining Record*, it may soon become necessary to print the special rules in more languages than the English. The members of the P. W. A. might prefer but one language, and that none be permitted to enter a mine who did not understand it. That desire complied with might mean the crippling seriously of some mines. I notice that hereafter the Manitoba Government will convey coal lands to no man who will not enter into bonds to give every countryman who comes with his team to the pit as much coal as he can use for a dollar and seventy-five cents per ton. That either means that the coal mine operator will work for nothing or else salt those who do not take the coal away in farm wagons. Some down here are under the impression that miners out West demand more wages than those of the East. That will not be possible with a dollar seventy-five cent coal, unless the mines in Manitoba make no water, require no timbering and have very soft coal. The wage bill alone of one of the Nova Scotia collieries was $75,000, and the coal raised was less than 35,000 tons. That gives two dollars a ton for labor, without counting material, royalty, or fixed charges. Some reformers down here hysterically call upon the Provincial Government to undertake the working of a coal mine. If the Government only would it would result, so they say, in cheaper coal and bigger wages. Just how the Government is to do this marvellous trick is not explained. It is quite possible that if the Government selected a favorable area it might for a time, and not providing for the future, or for contingencies, which in coal mining may mean the wreck of the pit by an explosion, give the people, or some of them, two dollar coal. But what would it do when the mines became deep and costly? Would it abandon deep mines and begin again, in a new place? The people would permit no such utter folly. There are in one county alone of Nova Scotia at least 24 abandoned mines. Why are they abandoned? Not because all the coal has been extracted, but because when fire or explosion took place, and there being in these days what was supposed to be a superabundance of coal, the company found it cheaper to open a new mine than go to the trouble of reopening and recovering the old. Sixty years ago the General Mining Operators abandoned a pit in Cape Breton because the coal was more expensive to work than it would be in a new mine. That old pit was reopened some time ago by the Nova Scotia Steel & Coal Company, and the coal is actually costing less to produce than at another of their mines. The Government will not again tolerate the improvidence of the old days, and surely what they will not tolerate in others they themselves will not be guilty of. One of the stock cries of those who cry for cheaper coal is that it retards industries. There is one thing these have to explain, and it is this: Coal is higher in price to-day than at any previous time within the past fifty years, and yet industries are more prosperous than ever. Between the years 1878 and 1895, coal was dirt cheap. How fared it with industrial development in these years? It was all but stagnant. The item "notive power" is no doubt an important one, but it is quite insignificant as compared with "management." We must now have the best management, irrespective of cost; it was not always so, and just because it was otherwise was there so slow progress. The *Labor Gazette* gives the average wage of Canadian miners as $513 per annum. The average number of tons raised per person employed is 300. Some of the readers of THE CANADIAN MINING JOURNAL may be able to figure out how much profit a Manitoba mine owner will have if he sells coal at a dollar seventy-five.

Notices were posted at the shaft houses of Le Roi and Le Roi No. 2 mines on June 15th, informing the employes that on July 1st the following advances in wages would take effect:—Machine men, from $3.50 to $4 per day; muckers, from $3 to $3.25; shaft men, from $4 to $4.50; timbermen, $3.50 to $4.

GENERAL MINING NEWS

ALBERTA.

As a result of the fire which destroyed the equipment of the Walters' coal mine near Strathcona, six men lost their lives and fifty men are thrown out of employment.

QUEBEC.

Discoveries of molybdenite, graphite and copper are reported from the Gatineau district near the height of land. The claims registered in Quebec are located in two islands in Lake Kabingo.

ALASKA.

Junian.—On June 4th Judge Wickersham handed down a most important mining decision, which confirmed the right to the waters of any mining stream by appropriation, as against the rights of riparian land owners. This will have the effect of protecting mining companies against extortion by jumpers. The finding was made in the suit of Thorndyke versus the Alaskan Perseverance Mining Company and, applied to ditch companies throughout Alaska, will affect investments aggregating about $8,000,000.

NOVA SCOTIA.

GLACE BAY.

Construction work is being pushed by the Dominion Coal Company at Reserve. The screening plant, which will cost about $15,000, will be run by a 75 horse-power motor taking current at 500 volts. The new bankhead is about 250 feet in length. The trestle work to the east slope is 900 feet long, to the French slope 80 feet. Coal is hoisted from the pit by endless haulage. Chain haulage conveys it to the top of the bank.

GENERAL.

The Torbrook iron mines, which were recently shut down for a short time, have resumed work. The railway extension from the Wheelock shaft to the Martin property is almost completed. Many miners have left Torbrook for Cobalt.

It is stated that Mr. Hiram Donkin, of the Dominion Coal Company, is to be appointed Deputy Commissioner of Mines and Public Works.

President Richards, of the New England Gas & Coke Company of Boston, has announced that the company intends to go into the wholesale coal business and will bring to that port about 1,500,000 tons of Nova Scotia coal per year.

ONTARIO.

COBALT.

On June 14th seven miners were overcome by dynamite gas at the Cobalt Central.

The Nancy Helen Mine has installed a 12-drill compressor, driven by a gasoline engine.

A 10-drill compound air and steam compressor has been ordered by the Nipissing Company.

From No. 6 shaft on the Cobalt Lake Company's aeras a good showing of silver leaf is being taken.

The new vein cut by the Nipissing Company is an extension of the Trethewey Company's vein and is about six inches in width.

The Coniagas Mine is still the largest shipper. When the concentrator is completed her shipments will probably be increased by fifty per cent.

The 13-drill compound air and steam compressor ordered by the Cobalt Lake Mining Company arrived at Cobalt on June 8th. It has now been installed.

Superintendent Drummond, of the Nipissing, reports that $1,058,000 worth of ore has been blocked out. The mine is shipping at the rate of $100,000 per month.

North of Latchford forest fires, commencing about June 17th, raged for several days. Many prospectors lost their camp equipments. It is reported also that several lives were lost.

During the week ending June 8th, eighteen cars of ore were shipped from Cobalt. This makes a total for the year of 4,336 tons of silver-bearing ore. Last year's total shipments amounted to only 5,666 tons. The comparison is encouraging.

A good strike is reported on the Silver Leaf close to the Lawson porperty line. The vein is eight inches wide. It shows calcite, cobalt bloom, and native silver. The strike of the vein is diagonally across the property. Only for a short distance has it been stripped.

On the Right of Way property the main shaft is down over sixty feet. At the 75-foot level a cross-cut will be driven to the vein. Four cars have been shipped already, not including the ore taken out by La Rose people and afterwards awarded to the Right of Way. Superintendent Houston is pushing construction of ore house and shaft houses as rapidly as possible.

During the week ending June 8th the following shipments were made:—Coniagas, esven cars, 441,780 pounds; O'Brien, one car, 64,520 pounds; Nipissing, three cars, 196,630 pounds; Drummond, 44,090 pounds; Kerr Lake, two cars, 94,000 pounds; Trethewey, 61,000 pounds; Silver Queen, two cars, 124,580 pounds; Foster, one car, 40,000 pounds. Total, 1,066,900 pounds, making a record for a week's shipments.

Larder Lake.

The Dr. Redick Larder Lake Gold Mining Company has purchased the stamp mill, crushers, rolls, etc., formerly used by the Ottawa Gold Milling & Mining Company at their custom reduction works at Keewatin, Ont. The plant has been idle for about six years. The machinery is now being shipped to Larder Lake.

Port Arthur.

A New York party visited and inspected the West End Silver Mine on June 20th.

The Shakespeare Gold Mine, near Webbwood, Ont., is to be operated by power developed from the Birch Creek Falls.

The Government diamond drill has been sent to Eagle Lake, west of Port Arthur, to prospect a gold property owned by J. E. Stanton.

At the old West End Silver Mine Captain Pritchard is superintending the mining. A considerable amount of ore has already been stacked.

A discovery of zinc blende is reported from the Upper Wahnapitae. It occurs in limestone and is said to carry a few ounces of silver per ton.

The shaft of the Massey Mine has been pumped out and the levels are being cleaned. Mining will be resumed under the direction of Mr. Jas. Errington.

The Beaver Mine is being unwatered, and the Rabbit Mine will also be put in commission soon. The Silver Mines Consolidated Company is the prime mover in these activities.

Surveys are being conducted for a proposed new railway to connect the Helen Mine with the C. P. R. at Thessalon. A new smetler is to be erected at Thessalon, and 400 tons of ore per day will be shipped from the Helen.

BRITISH COLUMBIA.

At the Trail and Northport smelters fuel is arriving much more freely.

Development is progressing on the 350, 400 and 450 foot levels of the Iron Mask.

At Le Roi Mine the connection between the shaft and the winze on the 1,650 foot level has been completed.

A former foreman of the Granby, Mr. J. A. Miller, has been appointed superintendent of the California-Giant properties.

On June 23rd an explosion at the Crow's Nest Pass Company's No. 6 prospect, Coal Creek, near Fernie, B.C., resulted in the death of two men.

The Canadian-American Mining Company of Bellingham, Wash., is to begin working the Lorne Creek Placers at Lorne Creek, 100 miles up the Skeena River.

The Marble Bay miners' strike has been settled. The trouble arose from a misunderstanding on both sides, and the men have returned to work at their former wages and hours.

On the west coast of Vancouver Island, at Sidney Inlet, a copper property, owned by E. Dewdney, of Victoria, is to be exploited by Eastern capital. It is well situated as regards water shipment.

The Nest Egg Mine, Rossland, has been leased by Edward Webb from the British Columbia Land & Development Agency, Limited, of London, England. The mine has not been worked since 1897. A sixty foot shaft and a few short drifts constitute the present developments.

It has been decided that in future a permanent summer mining class of the Mining Department of McGill University will be held in British Columbia. The Hon. H. E. Young, Minister of Education, is co-operating with Professor J. Bonsall Porter in making all necessary arrangements.

Thirty-five miles from Jedway, Queen Charlotte, a large deposit of copper ore is reported to have been discovered. The property is undr option at a figure of $400,000. The deposit is 100 feet wide and has been traced for 4,000 feet. It is said to carry 4 per cent. copper and some gold values. Four thousand tons of copper ore are awaiting shipment at Ikeda mine and was taken from Ikeda Mountain. The remainder came from the MacMillan mine. The ore will be shipped to the Ladysmith smelter.

The British Columbia Government has sent Mr. Herbert Carmichael, accompanied by two third-year McGill men, Messrs. Carruthers and Meyerstein, to the Alberni district on the west coast. A steam launch is to be taken up the coast, transported twelve miles by wagon road to Great Central Lake and used there during the summer. While Mr. Carmichael will perform a considerable amount of topographical work, he will also pay especial attention to the mining posibilities of the Alberni district. The Government will issue bulletins from time to time, reporting the progress of this work.

Mr. Thomas Kiddie, manager of the Brown-Alaska smelter, Hadley, Prince of Wales Island, was in Victoria early in June making arrangements to overcome the coal and coke shortage which has been handicapping the operation of his enterprise. The recent fire in the Comox coal mine caused a stoppage of shipments and had an immediate effect upon the smelter. Mr. Kiddie expressed the hope that he would be able to secure regular shipments of fuel before leaving for Hadley again. In speaking of the copper ores treated at Hadley, he said that the Maple Bay ores, which constitute their principal supply, are very silicious. To obviate the necessity of using barren fluxes, basic ores from nearby deposits are about to be secured. Mr. Kiddie has ordered the material for an installation of his hot blast system.

YUKON.

Until new discoveries shall have been made it may now be premised that the day of the individual miner in the Yukon is over, and operations in future will be confined to exploitations on a large scale by such powerful concerns as the Guggenheim Exploration Company, who last year secured the control of large areas of ground on Banaza, Hunker, Eldorado and other creeks which erstwhile yielded so fabulously. This company is meanwhile sending in large quantities of supplies and materials for the

commencement of extensive dredging and hydraulicking operations; and no less than a million feet of timber to be used for dredge construction purposes was recently purchased in British Columbia and is now being shipped to Dawson via Skagway. The pipes to be installed in connection with the company's water system are also of usual size, being 70 feet in length and 4 feet in diameter.

MINING NEWS OF THE WORLD

AUSTRALIA.

Queensland's gold yield for the first quarter of the present year represents a value of £464,960, or a slight decrease compared with last year's returns for the corresponding period.

Australia's gold output for the first four months of 1907 shows a falling off of over a hundred thousand ounces. The production, nevertheless, reached the respectable total of 1,048,647 ounces.

At Broken Hill the Zinc Corporation are experimenting with the granulation process, one unit having turned out a satisfactory concentrate on a limited scale. Six Ullrich magnetic separators have been installed and a trial run proved successful.

A report has been issued by the Commission appointed by the West Australian Government to inquire into allegations of gold stealing in that State. The report contains several pages of recommendations, including a stricter supervision of the gold-selling business, while the establishment of searching rooms at the mines is advised.

One company that has actually accomplished more than the prospectus promised is the Great Cobar, which was formed in May of last year. Since September last the mine has produced 3,217 tons of copper, 7,595 ounces of gold and 47,300 ounces of silver. As a result of development work, the ore reserves have been considerably increased, and now represent eight years' supply at the present rate of production. The company's consulting engineer is Mr. J. D. Kendall, of London, well known to many of our readers in the West.

UNITED STATES.

Applications have been made for patents covering asbestos areas in Placer County, California. On one property some development work has been prosecuted and asbestos of good quality exposed.

At Butte, the shaft on the High Ore, one of the Anaconda group, has been sunk to the great depth of 2,800 feet, where an immense station is to be cut. At the Boston and Montana production is being made at the rate of 3,300 tons a day.

The Calumet and Hecla mine, Houghton, Michigan, is being equipped with a large recrushing mill to treat the tailings from the other mills and preparation of the present stamp sands. The plant includes 48 Chilean mills and Wilfley tables.

The verdict in the case of the Stratton Independence Company vs. the Portland Gold Mining Company, in which the latter originally sued for damages on the grounds of trespass and the extraction of a large quantity of valuable ore, having gone to the dependants, the plaintiff company has given notice of appeal. The sum involved is in the neighborhood of half a million dollars.

GREAT BRITAIN.

It is proposed to establish at South Kensington an Imperial College of Science and Technology. Specialized courses in mining and metallurgy will form one of the departments of the work of the Imperial College, and provision will be made therefor in the charter.

In the course of a speech recently in the House of Commons, the Prince, referring to the regulation of the hours of labor in mines, said that the Report of the Departmental Committee on the subject showed how absolutely necessary it was for careful enquiry before introducing legislation of a radical nature. In the light of the report it was expected that a Bill would be shortly prepared, and he was not without hope that it might pass this session. A more likely contingency was that it would be introduced, criticized and made the subject of arrangement, consultation, suggestion, and perhaps compromise during the autumn, which would enable the Bill to be easily carried in the session that was to come.

SOUTH AFRICA.

The gold output of Rhodesia for April was 49,772 ounces.

The Transvaal diamond production for March aggregated 159,303.76 carats, valued at £239,610.

A tax of 7 per cent. on the profits of diamond mines exesting before the ordinance of 1904 is to be imposed in Orangia.

A general strike has been declared by the miners on the Rand, and it was considered necessary to call out cavalry to put a stop to a demonstration.

At the recent session of the Legislative Council of Rhodesia, a resolution was introduced declaring that the time ha deome for the British South Africa Company to be relieve dof its admanistrative responsibilities, and that administration be entrusted to a representative Government. It was finally decided to approach the Imperial authorities to secure a change in this regard. There is no doubt that the mining industry of Rhodesia would be greatly benefited by the change suggested.

NEW COMPANIES

A. W. Jacobs Mines, Ottawa, $1,500,000.

Tilbury Gas Company, of Chatham, $40,000.

Cobalt & James Mines, Toronto, $1,000,000.

Canadian Bessemer Ores, Toronto, $250,000.

Lansing Cobalt Mining Company, Windsor, $400,000.

Searchlight Larder Lake Mines, New Liskeard, $3,000,000.

Coleman-Bucke Silver Mining Company, Ottawa, $1,000,000.

Prospect Developing & Mining Company, Cobalt, $1,000,000.

The Nipissing Gold Estates, Limited, Cobalt; capital, $4,000,000.

Cobalt Confederated Mines, Limited, Cobalt; capital, $3,000,000; shares, $1 each.

Buffalo Larder Gold Mines, Limited, Toronto; capital, $2,000,000; shares, $1 each.

Red Jack Mining Company, Limited, Midland, Ont.; capital, $500,000; shares, $1 each.

Montreal Gold & Silver Mining Company, Limited, Cobalt, Ont.; capital, $10,000; shares, $1 each.

New Liskeard Lands, Timber & Mines Company, a colonization and land enterprise, $300,000.

COMPANY NOTES

The annual meeting of the Dominion Iron & Steel Company has been set for July 5th. The directors passed on the report at the meeting to-day.

Under the reorganization of the Canada Corundum Company, recently completed, Mr. C. S. Wilcox becomes president, Mr. C. D. Warren chairman of the Board of Directors, and Mr. D. A. Brebner remains secretary-treasurer. Mr. H. E. T. Haultain, who has been in charge of the production end of the business for the past twenty-one months, has been appointed general manager and has moved the head office of the company from Toronto to Craigmont.

Catalogues and Other Publications Received

A special catalogue, with a strikingly beautiful cover, is issued by the Canadian Westinghouse Company, Hamilton, Ontario. Its subjects are electric fans and small power motors.

The American Spiral Pipe Works, P. O. Box 485, Chicago, Illinois, in a neat and attractive catalogue, illustrate their forged and rolled steel pipe flanges. One of their specialties is spiral riveted pipe for water supply lines.

"Mine and Quarry" for May, 1907. This very readable periodical, published by the Sullivan Machinery Company, Chicago, contains articles illustrating the use of their various drills, coal mining machines, etc. The May number gives a description of "Mineral Prospecting at Cobalt."

"Morton's Hand Book of the Cobalt District," published by Cobalt Mining Information Bureau, Limited ,1223-4 Traders Bank Building, Toronto, Canada. This convenient little hand book contains a geological sketch of Cobalt and a list of "passed" claims in Coleman, Bucke and Lorrain Townships. In addition, it gives a list of mining companies operating in Cobalt and important extracts from the Ontario Mines Act, 1906.

Under the title "Paroid Proofs," F. W. Bird & Son, makers of Paroid Roofing, issue a booklet in which are displayed photographs of buildings in various places of this continent, where "Paroid" is used. "Paroid" is a fireproof, weather-resisting roofing material. It is particularly adapted to the requirements of mine owners. The Canadian factories of F. W. Bird & Son are situated in Hamilton, Ont., and in Winnipeg, Man.

Two interesting photographs have been received from Messrs. Peacock Brothers, engineers, Canada Life Building, Montreal. The first is a group of views of the construction of the "King Edward VII." bridge, Newcastle-on-Tyne, built for the Northeastern Railway. The whole of the steel castings, including roller and fixed bearings, for the bridge are of Hadfield's best cast steel. The second photograph shows Hadfield's foundation plates with pivots and rollers. Messrs. Peacock Brothers are the Canadian agents.

A volume of superb photogravures has been received from the Brown Hoisting Machinery Company, Frick Building, Pittsburg, Pa. Many photographs of their installations of patent automatic hoisting and conveying appliances in America and Europe are reproduced. The "Brownhoist" has proved a potent factor in decreasing freight rates on the Great Lakes. A smaller volume shows the standard designs of the "Brownhoist" cranes. To these cranes is attached the "Weston Patent" safety lowering device.

STATISTICS AND RETURNS

Nelson, B.C., June 15.—The following are the ore shipments and smelter receipt sin Southeastern British Columbia districts for the past week and year to date in tons. Shipments:—

	Week.	Year.
Boundary	27,825	434,251
Rossland	5,898	119,919
East of Columbia River	2,763	56,005
Total	36,486	610,175

Smelter Recepts—

	Week.	Year.
Grand Forks	14,767	236,611
Grenwood	9,067	121,353
Boundary Falls	4,021	64,534
Trail	3,686	98,363
Nelson	353	8,551
Northport	2,846	44,255
Marysville	600	14,400
Total	35,340	588,067

British Columbia re shipments for week ending June 8th:—

Boundary Shipments

Mine.	Week.	Year.
Granby	12,621	220,553
Mother Lode	4,400	88,617
Oro Denoro	240	1,578
Brooklyn	480	25,595
Idaho	640	1,836
Rawhide	1,280	22,036
Sunset	840	9,100
Providence	60	667
Mountain Rose	70	2,012
Other mines	.....	34,432
Total	20,631	406,426

Rossland Shipments—

Mine.	Week.	Year.
Centre Star	2,630	38,772
Le Roi	3,369	58,177
Le Roi No. 2	583	8,980
White Bear	78	1,172
White Bear, milled	350	2,550
Other mines	.....	3,370
Total	7,010	114,021

Kootenay-Slocan Shipments—

Mine.	Week.	Year.
Sullivan	600	13,800
La Plata, milled	425	9,775
Second Relief, milled	145	3,055
Queen, milled	185	4,255
Eva, milled	230	1,150
Whitewater, milled	300	1,050
Queen Victoria	136	1,994
Silver King	100	1,010
La Plata	88	1,510
St. Eugene	230	6,510
Hunter V.	109	2,188
Slocan Sovereign	47	69
Ottawa	22	125
Whitewater Deep	102	360
Other mines	.....	6,391
Total	2,719	53,242

The total shipments from the mines in the above districts for the past week were 30,360 tons, and for the year to date $573,689 tons.

The output of the Crow's Nest Pass collieries for the week ending June 21st was 19,371 tons. The daily average was 3,228 tons. For the corresponding week last year the output was 20,800 tons.

The output of the Crow's Nest Pass Coal Company's collieries for the week ending June 14th was 23,300 tons; daily average, 3,885 tons. The output for the week ending June 15th last year was 20,790 tons, a daily average of 3,465 tons.

During the month of May Le Roi Mine shipped to Northport 10,930 tons of ore, containing 2,495 ounces gold, 4,972 ounces silver, and 272,100 pounds copper. Estimated profit on this ore after all deductions, $17,500. Expended on development during the month, $13,000.

The following are the figures of German consumption of foreign copper for the months January to April, 1907:—Imports of copper, 39,059 tons; exports of copper, 2,834 tons; consumption of

copper, 36,225 tons; as against 38,804 tons during the same period in 1906.

Of this amount 31,103 tons were imported from the United States. Figures are compiled by L. Vogelstein & Company.

Cobalt ore statement for period June 16th to June 22nd, 1907:—

Trethewey Mine.—June 17th, 61,200.

Nipissing Mine.—June 17th, 60,000; June 19th, 40,160; June 21st, 59,840. Total weight, 160,000.

La ose Mine.—June 18th, 44,040; June 18th, 64,140; June 18th, 42,030; June 21st, 82,006; June 21st, 84,000. Total weight, 316,215.

Coniagas Mine.—June 17th, 67,410; June 17th, 62,000; June 18th, 62,000; June 19th, 62,000; June 20th, 62,000; June 20th, 58,450; June 21st, 62,000. Total weight, 435,860.

Buffalo Mine.—June 19th, 60,000; June 20th, 60,000; June 20th, 41,130; June 21st, 60,000. Total weight, 221,130.

Total weight for all mines, 1,194,406.

METAL, ORE AND MINERAL MARKET

Aluminium, No. 1 grade ingots—46 cents per lb.

Antimony—12 to 16 cents per lb.

Arsenic, white—7 1-2 to 7 3-4 cents per lb.

Barytes, crude—$11.25 to $14.50 per short ton.

Bismuth—$1.50 to $1.75 per lb.

Cadmium—$1.40 per lb.

Carbons, for drills—$78 to $85 per carat.

Carborundum, powdered—8 cents per lb.

Chronium, metal pure—80 cents per lb.

Cobalt, f.o.b. Cobalt, Ont., unrefined—35 to 50 cents per lb.

Corundum—7 to 7 1-2 cents per lb.

Feldspar, ground—$9.75 to $10 per short ton.

Flourspar, lump—$10 per short ton.

Graphite, domestic—$50 to $150 per short ton.

Gypsum, lump—$4.50 per long ton.

Infusorial earth, ground—$15 to $30 per ton.

Lead—5.75 cents per lb.

Manganese, pure metal—75 cents per lb.

Mica, ground—$80 per short ton.

Mica, scrap—$15 per short ton.

Molybdenum, pure—$1.70 per lb.

Molybdenite ore, 95 per cent. pure—$4.50 to $5 per unit.

Nickel—45 to 50 cents per lb.

Platinum, ordinary metal—$27 per ounce.

Platinum, scrap—$20 to $21 per ounce.

Pyrite, 38 per cent. to 45 per cent. sulphur, lump, 10 to 11 1-4 cents per unit.

Quicksilver—$41 to $42 per 75 lb. flask.

Talc—$18 to $23.50 per ton.

Tungsten, pure metal—$1.25 per lb.

Tungsten ore, 60 per cent. pure—$400 per ton.

Tin—43 1-2 cents per lb.

Zinc Sheets—$8.60 per 100 lbs.

MARKET NOTES.

Spelter.—Busines is dull and prices have declined. New York, 6.40 to 6.45 cents per lb.; London, £24 10s. per long ton.

Lead.—Quiet market. Very little business being transacted. New York, 5.75 cents per lb.; London, £20 15s. for Spanish; £21 for English.

Northern pig iron No. 1 ranges from $26.50 to $27 for delivery within thirty days. Bessemer malleable, $26 to $26.50. Bessemer ore, old range, $5. Bessemer mesabi, $4.75. Non-Besesmer, old range, $4.25.

Tin.—Although the market has been quiet, foreign manipulation has caused an advance in the price of tin. This has been felt more decidedly in London than in New York. New York, 43 1-2 cents per lb.; London, £187 10s for spot.

The copper market is stagnant, and further reduction in price is expected. Lake copper, 23 3-4 to 24 1-2 cents per lb.; electrolytic, 22 1-4 to 22 3-4 cents per lb. London quotations on long ton of 2,240 lbs. for spot standard are £99, or 21.50 cents per lb.

Silver.—There have been strong movements in silver:—June 13th, 66 7-8 cents per ounce; June 14th, 66 3-4 cents per ounce; June 15th, 67 1-4 cents per ounce; June 17th, 67 1-8 cents per ounce; June 18th, 67 1-2 cents per ounce; June 19th, 67 3-8 cents per ounce. Mexican dollars, 52 1-8 cents. British sovereigns, $4.85. Sterling exchange, $4.8735.

NEW DIVIDENDS.

The Granby Consolidated Mining, Smelting & Power Company, Limited, at the regular monthly meeting of its directors, held in New York on June 4th, declared a regular quarterly dividend of 2 per cent. and an extraordinary dividend of 1 per cent., payable June 29th out of the net earnings of the company. This is the seventh dividend of the Granby Company. It amounts to $405,000. The shares are now paying a regular 8 per cent. dividend, with extra 1 per cent. quarterly dividends bringing up payments to 12 per cent. per annum. The dividends to date are as follows:—No. 1, December, 1903, $133,630; No. 2, January, 1906, $405,000; No. 3, May, 1906, $405,000; No. 4, September, 1906, $405,000; No. 5, December, 1906, $405,000; No. 6, March, 1907, $405,000; No. 7, June, 1907, $405,000. Total, $2,563,630.

At a general meeting of the shareholders of the Richard III. Mine, held on June 7th, in Victoria, B.C., a dividend of 2 1-2 per cent. was declared, payable on and after June 15th. It was announced that after payment of this dividend a reserve of $10,000 would remain for carrying on development work. Ore from this mine is being treated at the Tyee smelter, Ladysmith.

The regular quarterly dividend of 3 per cent., or 15 cents per share, has been declared by the directors of the Nipissing Mines Company. No action was taken in regard to the erection of a smelter. No figures were given out, but it is understood that the financial report was satisfactory. The company is said to have enough cash to pay the next two quarterly dividends.

NOVA SCOTIA STEEL DIVIDENDS.

The Nova Scotia Steel & Coal Company declared dividends of 1 1-2 per cent. on common, and 2 per cent. on preferred, payable July 15th, to holders of record of June 30th.

The Coniagas Mine has declared a dividend of 2 per cent., payable on July 1st.

Crow's Nest Pass Coal has declared the regular quarterly dividend of 2 1-2 per cent., payable July 1st.

The directors of the Dominion Coal Company met in the first week of June to declare the quarterly dividend on Dominion Coal common stock. The dividend is payable in July.

At a meeting of the directors of the Kerr Lake Mining Company it was decided to pay the regular quarterly dividend, No. 7, of 2 per cent. and 1 per cent. bonus, on July 1st to all shareholders on record on June 22nd, 1907.

WANTED

MINING MACHINERY FOR SALE

Splendid opportunity to secure some good machinery far below the price of new and all or any part of it can be delivered on the cars in one week.

One Class B Rand Cross Compound Condensing Duplex Air Compressor having a capacity of 835 feet of free air and will run 10 No. 2 Rand Drills. High pressure steam 14 x 24, low 22 x 24, air cylinders each 14 x 22. Has Myers' patent steam cut off valves and machanically operated air valves. Machine good as new.

One double cylinder, 10 x 16, Lidgerword Hoisting Engine. Drum, 54-inch diameter and holds about 700 feet of wire rope without overlapping. End friction and friction hand break. This machine is as perfect as the day it left the shop.

Lots of Steam Pipe ranging from 2 to 5 inches.
Light Steel Pit Rails about 14 pounds.
Steel Piping Tools from 2 to 5 inches.
One Heavy Duty Steam Mining Pump.
One Northy Duplex Steam Boiler Feed Pump.
Rand No. 2 Rock Drills and Barrs.
Rock Drill Steel ready for machines and in good lengths.
One 15 H. P. Steam Engine.
One 25 H. P. Steam Engine.

These engines would be just the ones for a saw mill or could be used as a pumping engine for a mine. Steel Ore Car Bodies just the thing for underground work. This lot of odds and ends will be sold low for cash.

For particulars address, G. M. this paper.

Mining Graduate (McGill) with eight years practical experience metal mining and management, would like to secure a position in the Cobalt district. Used to organizing and handling large output at minimum cost.

Interested parties kindly reply to A.C., care of Canadian Mining Journal

Young Technical Graduate wanted as personal assistant to the General Manager of the Canada Corundum Co., at Craigmont, Ont. Must be a fair draughtsman with some knowledge of machinery

Give references and state salary expected

Position Wanted as Chemist or Assayer

at a mine or metallurgical plant by graduate mine Engineer; good mineralogist, three years laboratory work in assaying, qualitative analysis, at a technical college. Three years experience as miner, foreman, surveyor and assistant mine superintendent. Understands smelting mining and milling machinery. Knowledge of French and Germany language. Age 30, single, will go anywhere. Best reference for diligence and character. Salary moderate.

Address, B. W., care of Canadian Mining Journal.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of ihe Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who posses properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the serviees of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre;

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

Province of Nova Scotia

Leases for Mines of Gold, Silver Coal, Iron, Copper, Lead, Tin

AND

PRECIOUS STONES

Titles given Direct from the Crown, Royalties, and Rentals Moderate

NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long 65½ feet broad 14,500 tons

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

PAROID ROOFING

"The Test of Time is the Test that Tells."

Before buying roofing for your coal shed, power house or mine buildings, get our story on Paroid Roofing.

Don't be confused by the many and puzzling claims of some roofing manufacturers.

When a rooffng is the accepted standard of Governments, railroads, manu. facturers, mine owners and farmers everywhere, it means something. It means quality and service.

Only one way to tell the real value of any roofing. That's the test of time—the test of actual wear and service. Paroid has stood that test in every respect. What Paroid has done for others it will do for you.

Paroid is weatherproof in heat or cold; will not melt or run in summer, nor crack and freeze in winter; is absolutely unaffected by fumes, dampness or gases; is spark and cinder proof.

Paroid is the only roofing with rustproof caps. These are square and waterproofed on both sides, They hold firmer and cannot rust out like ordinary causing leaks.

Anyone can lay Paroid. Full directions and necessary materials are packed in each roll.

Send for free sample and our booklet "Paroid Proofs."

UNDERWOOD

The Underwood is the best typewriter. But even the best typewriter would be of little use without an operator. Underwood operators are always available.

All the commercial schools of any importance teach the Underwood exclusively (and school men are keen judges of typewriters). Skill in operation is acquired only under expert instruction.

With other machines you have to put up with poorly trained incompetent typists. With an Underwood you are safe. Through our Employment Department we supply nearly 1000 stenographers a year. All-round typewriter satisfaction is secured only with the Underwood.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Spring Catato6ue was ready for mailing on the first of March. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our Spring Catalogue for 1907 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the special Summer Catalogues.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Westinghouse
MOTOR-DRIVEN PUMPS

Westinghouse Induction Motor Driving Byron-Jackson 5-Stage Centrifugal Pump.

Where motor-driven pumps are used the heat always attending steam pipes and engine-driven pumps, the danger and expense of bursting or leaky pipes, the annoyance of steam traps, separators, etc., is eliminated. The space required for electric service wires is negligible compared with that required for piping, and in case of accident, any mechanical injury can be easily and quickly repaired.

NEW ORE CRUSHER AT WORK

WILL CRUSH 1,500 TONS OF KNOB HILL ORE EVERY 10 HOURS.

OPERATED BY ELECTRICITY SUPPLIED BY CASCADE POWER CO.

Phoenix, Jan. 23.—(Special to The Daily News.) —This week all the electric wire connections having been made, the new ore crusher, ordered last May by the Granby company, was started in operation. It has been ready for some time and only awaited the coming of the electric current from Cascade.

The initial run of the huge machine was eminently satisfactory to superintendent Williams, who will have it operated 10 hours daily, in which time it will crush 1,500 tons of Knob Hill ore. Later another machine of the same type will probably be installed at the Old Ironsides' ore bins.

The crusher is of the Blake-Farrell type and is the largest machine of its kind in Canada. The chilled steel jaws will take a piece of rock 36x42 inches in size, more than a cubic yard, and is fitted with swing jaw and pitman. It was furnished by the Jenckes Machine company, of Sherbrooke, Que. The freight on one of the several cars in the shipment was over $2,000.

To operate the crusher a 100 horse power electric motor was secured from the Canadian General Electric company.

Largest Crusher in Canada

The newspaper clipping reproduced herewith refers to a 42" x 30" Crusher built by us for the Granby Smelter at Phoenix, B.C., being the first of four similar, counting one now under construction, built for this same company. The four Crushers have a total capacity of six thousand tons of rock every ten hours. They are the largest Crushers of the Jaw type in Canada.

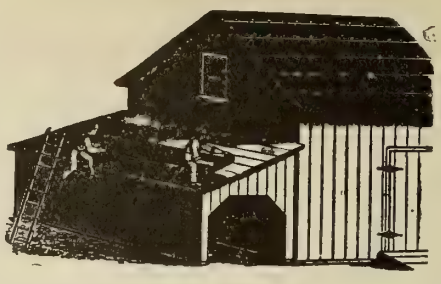
Amatite ROOFING

THE MINERAL SURFACED ROOFING

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expense of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.

The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.



Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

PAROID ROOFING

"The Test of Time is the Test that Tells."

Before buying roofing for your coal shed, power house or mine buildings, get our story on Paroid Roofing. Don't be confused by the many and puzzling claims of some roofing manufacturers.

When a roofing is the accepted standard of Governments, railroads, manufacturers, mine owners and farmers everywhere, it means something. It means quality and service.

Only one way to tell the real value of any roofing. That's the test of time—the test of actual wear and service. Paroid has stood that test in every respect. What Paroid has done for others it will do for you.

Paroid is weatherproof in heat or cold; will not melt or run in summer, nor crack and freeze in winter; is absolutely unaffected by fumes, dampness or gases; is spark and cinder proof.

Paroid is the only roofing with rustproof caps. These are square and waterproofed on both sides, They hold firmer and cannot rust out like ordinary causing leaks.

Anyone can lay Paroid. Full directions and necessary materials are packed in each roll.

Send for free sample and our booklet "Paroid Proofs."

VOL. I, No. 9, New Series | TORONTO and MONTREAL, July 15, 1907 | Old Series, Volume xxviii, No. 11

The Canadian Mining Journal

With which is incorporated the
"CANADIAN MINING REVIEW"
Devoted to Mining, Metallurgy and Allied Industries in Canada
Published fortnightly by the
MINES PUBLISHING CO., LIMITED

Head Offices - Confederation Life Building, Toronto, and 171 St. James Street, Montreal.
Branch Offices Halifax, Victoria, and London, Eng.

Editor:
J. C. MURRAY, B.A., B.Sc.

Associate Editor, H. MORTIMER-LAMB, Secy. C.M. Inst.
Business Manager - - - J. J. HARPELL, B.A.
Circulation Manager - - A. P. DONNELLY, B.A.

SUBSCRIPTIONS—Payable in advance, $2.00 a year of 24 numbers, including postage in Canada. In all other countries, including postage, $3.00 a year.

Advertising copy should reach the Toronto Office by the 8th, for the issues of the 15th of each month, and by the 23rd for the issues of the first of the following month. If proof is required, the copy should be sent so that the accepted proof will reach the Toronto Office by the above dates.

SPECIAL CONTRIBUTORS

GEOLOGY: Dr. Frank D. Adams, McGill University; Dr. A. E. Barlow, late of Geological Survey of Canada; Professor Willett G. Miller, Provincial Geologist of Ontario; Dr. J. E. Woodman, Dalhousie University, Halifax, N.S.

CHEMISTRY: Dr. W. L. Goodwin, Director School of Mining, Kingston, Ontario; Milton Hersey, M.Sc., Official Analyst Province of Quebec.

MINERALOGY: Professor W. Nicolet, School of Mining, Kingston, Ontario.

MINING: S. S. Fowler, M. E., Nelson, B. C.; Frederick Keffer, M.E., Anaconda, B.C.; A. B. Willmott, M.E., Sault Ste. Marie, Ont.; J. C. Gwillim, M.E., School of Mining, Kingston, Ont.; J. Bonsall Porter, M.E., McGill University; John E. Hardman, M.E., Montreal; Fritz Cirkel, M.E., Montreal; Dr. E. Gilpin, Department of Mines, Halifax, N.S.; George W. Stuart, M.E., Truro, N.S.

METALLURGY: Hiram W. Hixon, M.E., Mond Nickel Company, Victoria Mines, Ontario; Stafford F. Kirkpatrick, School of Mining, Kingston, Ontario; A. P. Scott, Dominion Iron & Steel Co., Cape Breton.

COAL: Hon. Robert Drummond, Stellarton, N.S.

NATURAL OIL AND GAS: Eugene Coste, M.E., Toronto, Ont.

CEMENT: Manley Baker, M.A., School of Mining, Kingston, Ont.

TO OUR READERS

THE CANADIAN MINING JOURNAL has made a strong and gratifying start in life. It has reached that stage where change and improvement are pre-requisite to its continued usefulness. Latterly many of our readers have sent in suggestions, embodying their personal wishes. These deal almost exclusively with our news, metal market and other departments. Nearly all of these suggestions we have gladly made use of. All of them are good; some of them, however, owing to reasons which have to do with our own facilities, are not at present practicable. It has been impossible personally to acknowledge all these kind letters. We wish, nevertheless to convey our thanks through these columns.

We also wish to request that all of our readers send us comments, suggestions and criticisms whenever THE CANADIAN MINING JOURNAL fails to supply their needs, whenever they wish to have new subjects dealt with, whenever, in fact, they feel that THE CANADIAN MINING JOURNAL is not adequately and impartially representing the mining interests of the Dominion.

But to be fair to ourselves we must touch on the other side of the shield. Our growth in usefulness and strength must be dependent upon and commensurate with the growth of Canada's mineral industries. We are in no sense the mouthpiece of any special interests. We rely for support upon the legitimate miner, the prospector, the metallurgist and upon all those directly and indirectly concerned with the actual development of Canada's superb mineral resources. It is, therefore essential that all of our readers continue to consider this publication as their special medium, and to act upon the conviction that their interests can best be served only so long as they themselves actively help in making its columns increasingly useful. It were ungracious to conclude this homily without heartily thanking once more those of our subscribers who have of late honored us with letters commendatory and otherwise.

ONTARIO'S VISITORS

The approaching visit of the American Institute of Mining Engineers is an event of more than ordinary importance. The Institute's membership comprises distinguished technical writers, educationists, engineers, metallurgists and chemists. On another page we have reproduced an historical sketch of the Institute, written by its secretary, Dr. R. W. Raymond.

The proposed itinerary of the visitors has already been published. The first meeting in Toronto is called for July 23rd at the King Edward Hotel. THE CANADIAN MINING JOURNAL hopes that the visit to Toronto and

the subsequent tour through Cobalt, Copper Cliff and other places will be made memorable for the American Institute of Mining Engineers.

THE DISCOVERER OF KLONDYKE

Evidence has been gathered which shows fairly conclusively that to Robert Henderson, of Pictou, Nova Scotia, belongs the honor of being the discoverer of Klondyke. In 1894 Henderson was outfitted at Ogilvie by his friend, Joseph Ladue. The summers of 1894 and 1895 he spent in prospecting the streams of the Indian River Valley. During the winters of these years he mined alone on Quartz Creek. In the summer of 1896 he discovered gold in Hunker Creek Valley, or Gold Bottom, as he himself named the district. Provisions gave out in August and Henderson was forced to go to Ogilvie for fresh supplies. On his way back to Gold Bottom, by the Klondyke River, he spent a night on the present site of Dawson. It was here that he came upon Carmack. To Carmack Henderson made known his discovery, and invited him to come up to Hunker Creek and stake. Carmack followed in a few days, staked near Henderson's discovery and, returning, discovered gold in Bonanza Creek. Of this discovery Carmack did not notify Henderson, but proceeded to Forty Mile, where he spread the news. At first his story was received with incredulity, but before long the stampede began, and the new finds were staked out before Henderson had been informd of their existence.

Owing to complications, Henderson was refused a discovery claim on both Gold Bottom and Hunker branches of the river. He was, however, given the choice of staking one ordinary claim on either Gold Bottom, Hunker or Bear Creeks, or the equivalent of one out of five claims staked before others.

Carmack's ingraditude lost to Henderson the chance of controlling the richest gold deposits of the North.

A SUGGESTION

The Nova Scotia Mining Society has striven in several ways to stimulate various branches of that Province's mining industry. Within the past few years the Society has appointed committees to report upon gold mining, iron mining and the clay and cement industries. Although the work of these committees has, in some respects, been disappointing, yet, in the aggregate, very beneficient results are to be observed. Iron mining, for instance, is more actively carried on than ever before, and it is quite within bounds to state that it will very soon become a substantial and thriving industry. Gold mining, despite the Society's efforts, is not in a flourishing condition. We mentioned some time ago the causes that, in our opinion, have militated against the success of gold mining. Nova Scotia needs a practical demonstration of the benefits to be derived from the careful application of clean business principles and economical modern methods. The Richardson gold mine, perhaps, furnishes this. Several other gold mines are in a fair way to do it.

But, to return to the Society's endeavor to promote the mining industry; while tangible results may not in every case be observable, the influence of this organization for good is distinctly traceable in the gradually increasing confidence of Nova Scotians in their own Province's resources. This, in itself, demonstrates that the Nova Scotia Mining Society has not wrought in vain.

In the methods adopted by the Nova Scotia Mining Society there lies a suggestion for the Canadian Mining Institute. There is no reason why the Institute should remain in a state of somnolence throughout those periods intervening between its annual meetings. It may well learn a lesson from its energetic Eastern sister. Committees from the Institute could without difficulty find matters of profound importance to work upon during the year. The varied interests represented by the Institute's membership would gladly support any effort to more closely identify the Institute with the onward march of the sciences of mining and metallurgy.

THE VALUE OF A MINE

It would be hard to damn more conclusively the fatuous newspaper claims, made by certain mining brokers for their undeveloped gold properties, than by recommending possible victims to read thoroughly Mr. J. B. Tyrrell's article on the value of a mine. The first installment of Mr. Tyrrell's paper was presented in our last issue. In the present number appears a second.

One paragraph is exceedingly worthy of assimilation and digestion. It enunciates a principle too often ignored or lost sight of by investors.

Alluding to rates of interest on mining investments, Mr. Tyrell speaks to this effect: "In Canada rates of interest that would be considered fair and reasonable for a mining investment, keeping in view the many possibilities of loss, would vary from seven to twenty per cent." After characterizing as gamblers those who expect higher rates on mining shares, Mr. Tyrrell continues thus:

"In addition to the above rates of interest, the dividends must include certain sums which for a term of years should be credited to a sinking fund for the replacement of capital, and the question of how many years should be allowed for such repayment must be kept constantly and clearly in view, *or the investor will be certain to drop back into the idea that dividends are interest and nothing else.*"

The italics are our own. The sentence italicized expresses tersely and well the precise point on which the ordinary investor in mining property goes wrong. The examples with which Mr. Tyrrell illuminates his argument are typical.

COBALT LAKE

An editorial appeared in our last issue reflecting upon the large capitalization of the Cobalt Lake Mining Company. The Journal recently had an interview with a director of that company. It was suggested that, authough our previous information was, in the main, correct, yet our manner of presenting its might create an unfair impression. For the benefit of all interested we publish the following details. The following statement is given in its entirety:—

"The Cobalt Lake property was purchased by a syndicate of six persons, three representing Toronto and Detroit interests, and the other three representing a large number of parties in the Ottawa Valley. Before these came together the Toronto and Detroit parties had arranged to act independently and to form a company should they get the property. Their arrangements included the allotment of certain promotion stock, the amount of which was eventually fixed at $140,000. To the distribution of this, the Toronto and Detroit parties, represented by the three syndicate members, were agreeable. To effect this a corresponding block of $140,000 in shares was taken by the Ottawa Valley syndicate members, and by them distributed among those whom they represented. The property was transferred by the syndicate to the company in consideration of so many fully paid up shares, each branch of the syndicate getting its proportion, plus its $140,000. At the distribution each subscriber got three shares for each dollar paid, the respective shares of the $140,000. Thus the shares of the Toronto and Detroit subscribers cost them 33 1-3 cents, while those of the Ottawa Valley subscribers cost them approximately 30 cents. The only promotion stock was the $140,000 of the Toronto and Detroit syndicate. Apart from this and the customary brokerage, all the stock issued by the company went to the people who furnished the syndicate with the money for the purchase of the property, all members of each syndicate being treated alike. It is safe to say that few mining companies have been promoted on a more conservative basis.

"It may further be stated that the amalgamation of interests could not have been otherwise arranged, and that without the amalgamation it would have been difficult, if not impossible, to successfully carry out the purchase. Beyond this, the amalgamated interests were able to effect a saving to the parties represented of a sum largely in excess of the par value of the so-called promotion stock.

"As to the capitalization, it was necessary to fix upon an amount in anticipation of the purchase, in order to make a complete agreement between the different interests. The actual amount of stock issued is less than $4,000,000, and as the company has over $130,000 cash in hand for working capital, and over 57 tons of ore ready for shipment, with a completed plant in operation and paid for, there should be no necessity for any further issue, unless the company thinks proper to acquire further property."

We have been requested by the Copper Mining & Smelting Company of Ontario to extend a cordial invitation to the members of the American Mining Institute, during their Ontario session, to visit the company's Bruce Mines property. The officials of the company will be pleased to do all in their power to make such a visit profitable.

EDITORIAL NOTES

A new General Index is to be issued by the Geological Survey of Canada. The work of compiling this Index is under the direction of Mr. Frank J. Nicolas, editor of the Publications of the Survey. Advance sheets of this sadly needed Index display completeness, clearness and an intelligent grasp of essentials. Typographically, very little is left to be desired.

An enormous trust, whose capital reaches $130,000,000, has been formed in Great Britain by nine large iron and steel manufacturing concerns. Vickers, Sons & Maxim organized and promoted the movement. By the absorption of thirty-six independent companies the new combine will control fully 90 per cent. of the steel produced in Great Britain. The avowed object of this organization is to fit Great Britain to cope with German and American competition.

The article on "The Gold Mining Industry of Nova Scotia," which appears in this issue, is the authoritative expression of a mining man who has had splendid facilities for observing the true inwardness of gold mining in that Province. Mr. Brown gives some rather startling facts about gold stealing. He also shows, concisely and clearly, how gold mining has suffered from the early system of granting areas covering only twenty feet along the line of the lode. To those who accept without question the statement that Nova Scotia's gold mines are worked out, we recommend Mr. Brown's thoughtful and enlightened article.

Mr. G. C. Cole, the United States Consul at Dawson, gives in a recent official report a statement of the prices of provisions and necessities at present ruling in the Yukon Territory. These generally, it may be noted, are in the neighborhood of from three to four times as high as those obtaining in Eastern centres, which, conditions considered, does not seem too exorbitant. Thus beef sells for from twenty-five to fifty cents a pound, bacon thirty-five cents, milk thirty-five cents a quart, and flour six dollars a hundred. Two dollars a dozen for fresh eggs, however, would appear somewhat stiff to the economically minded, while one would hesitate before flooring one's abode with hardwood with undressed lumber at four hundred dollars a thousand. Wages in the Yukon remain about the same as three years ago, *i.e.*, $10 a day of ten hours for mechanics; $4 to $5 a day, with board, for ordinary laborers; and clerks, from $150 to $300 a month. The most reasonable charges seem to be for hotel accommodation, which range from $3 to $6 a day; but the Consul refrains from specifying the character of the accommodation offered at this price. The costs of living in the Yukon, will, of course, remain high until existing transporation facilities shall have been greatly improved.

THE AMERICAN INSTITUTE OF MINING ENGINEERS*

By R. W. Raymond.

Having been almost continuously an officer of this society since its organization in 1871, I may claim an intimate acquaintance with its history and administration; and I welcome the opportunity to explain in this contribution some features of its plan which are not perfectly understood by the public. Unfortunately, time is not at my command for an elaborate and complete discussion of the subject, and this sketch must necessarily be brief and fragmentary.

The period following the war for the Union was characterized by great activity in mining, and a great

Dr. Rossiter W. Raymond, Secretary of the American Institute of Mining Engineers.

demand for mining engineers. The mining industry of the Pacific States had been, ever since the discovery of gold in California, the leading factor in the settlement of the country, the improvement of communications and the establishment of civilized communities, with auxiliary agencies of commerce and manufactures, as well as education and religion. The governmental aid given to the Pacific railways, on the ground that these lines were military necessities for the handling of the Indian tribes and the maintenance of sovereign Federal authority throughout the vast Pacific slope, could have scarcely been secured, had not the mineral resources of that region given it a thrilling romantic interest and a boundless value in the eyes of the people of the East. At the same time, the exploitation of the Western mines and the rapid development of coal, iron and copper and lead mining in the other States, called for trained engineers; and successive technical schools were established in response to this demand, while technical journals flourished and became more and more devoted to problems of theory and practice, as well as records of new enterprises. Meanwhile, the actual mining engineers of the United States—those who were doing the great work of mining both East and West—could not be said to form an organized profession at all. There were a few graduates of foreign schools; many civil engineers who had turned their attention to mining; a much larger number of miners from Cornwall or Germany, who had risen to be mine captains and "experts"; and a still larger number of self-taught American miners and prospectors, ignorant and jealous of book knowledge, and over-conscious of superiority in many respects to its possessors and professors. This heterogeneous multitude had no common ground for the interchange of views and experiences, and no organized common feeling inducing them to seek and occupy such a ground. The technical journals and the technical schools alike are needed to be reinforced in their endeavors by some agency which should promote personal acquaintance and mutual esteem among the men in whose hands were the mining operations of America.

It was my realization of this feature of the situation that led me, as the editor of *The Engineering and Mining Journal*, to attend at Wilkes-Barre, in May, 1871 the meeting called by three mining engineers, Eckley B Coxe, Richard P. Rothwell and Martin Coryell, to organize an association. As a beginning, in default of a duly elaborated scheme to suit our special case, the Rules of the North of England Institute of Mining Engineers were adopted in substance, and the name of "The American Institute of Mining Engineers" was chosen for the new society without debate, as a matter of course. The rules were subsequently re-written; but the name, though in some respects a misnomer, since it does not fully describe the scope of the Institute, has survived, and has become so dear to the members and so well known to the world, that it is not likely to be changed. A lucky misnomer is sometimes a "mascot."

At the outset, a most important question arose, the settlement of which involved the whole future of the society. Several educated engineers protested against the admission to full membership of persons not belonging to the profession, and not possessed of a certain degree of professional standing and experience. They could not insist upon the degree of M.E. or E.M. as a qualification. They did not themselves hold that degree but they felt that C.E. or its equivalent in certified experience and knowledge ought to be required. In word, they did not wish to recognize as fellow-members (though they would consent to admit as associates) common miners, foremen and self-educated mine captains.

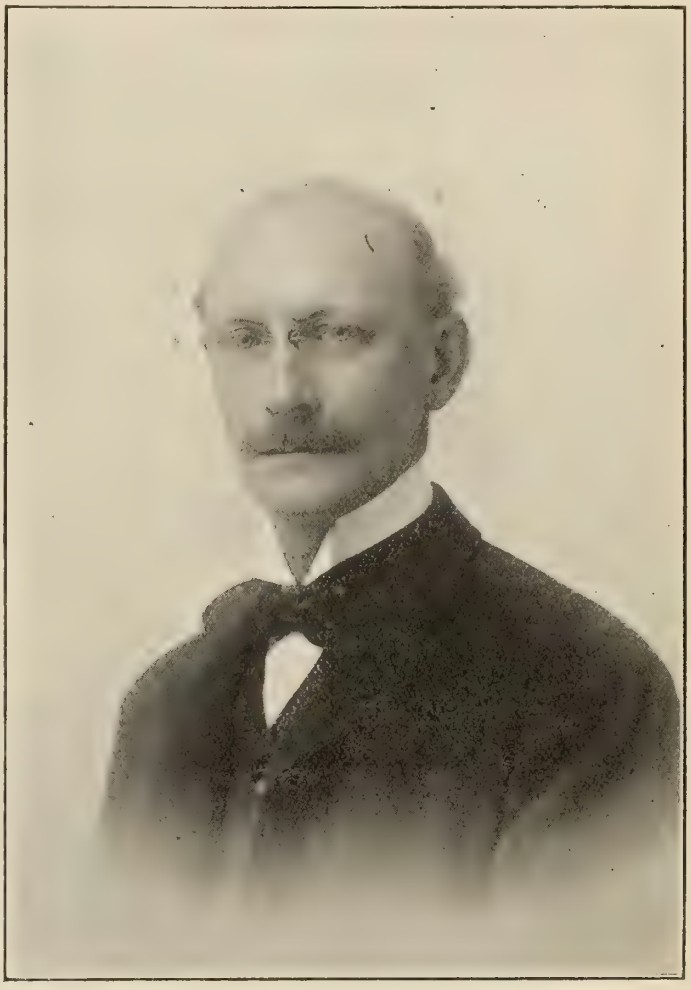
There was much to be said in favor of this feeling. Professional societies usually represent professions, and membership in them is accepted as a guaranty of professional standing. Consequently, they make carefu

*A paper presented to the American Mining Congress, at Denver, Colo., October 16th, 1906.

preliminary examination into the training and achievements of candidates, and sometimes impose a period of quasi-probation as "junior" before advancement to full membership. All this is excellent, for the purpose for which it was designed. But that was not the purpose of the Wilkes-Bare meeting of 1871; and if that had been its purpose, the movement would have failed. This point is so important as to warrant further explanation.

There was at that time no such thing in the country as a distinct profession of mine engineering, numerous enough to support an active and useful society. Any attempt to create one by means of a society would have resulted in a small, select (*i.e.*, self-selected) coterie, barren of influence and outside of practical connection with the national mining industry.

The pressing need of the hour was not the segregation of a select body, but the cordial co-operation of all the representatives of a great industry or group of industries. This could only be effected by bringing together on terms of friendly equality the schoolmen and the fieldmen, and persuading the latter to do what they were naturally shy and reluctant in attempting, namely, to tell what they knew, for the benefit of all. Unquestionably the self-educated, practical mining men and furnace men at that time knew more than the school graduates about the actual facts of American ore deposits, mine workings and furnace management. It was not the nominal manager but the Cornish captain who knew the mine; it was not the chemist, but the founder who ran the furnace. If these practical men were slighted at the beginning, they would stand aloof, giving no aid in the way of fresh facts, and leaving the theorists to exchange their speculations with little profit, like the traditional boys confined in the garret, who professed to have made money by swapping jacknives, back and forth.



Again, the work of publishing and distributing useful information could only be done upon an influential scale by a society with a large income; and this would require either a select, small society supported by heavy annual dues, or a numerous membership paying small dues. Beyond question, the latter was both easier to secure and more fruitful of influence as well as revenue. The result of thirty-five years' experience has left no doubt on that head. What the Institute has given to its members in the way of publications for the annual fee of $10 may be confidently compared in both quantity and quality with the similar publications of any society in the world, supported by annual dues of twice or thrice that sum.

Another point is worthy of note. A large membership, even if it be not narrowly confined to men of a certain ascertained standing in a single profession, furnishes an attractive and inspiring public to ambitious authors. A famous engineer (member of several other American and foreign professional societies, as well as of our Institute) once said to me: "The Institute is an association largely composed of young men with reputations to win, instead of older men with reputations to maintain. The consequence is, that your members are eager to communicate what they know or think, instead of being afraid to 'give it away,' or reluctant to incur criticism by offering professional contributions not monumentally complete and creditable to their acknowledged professional standing."

The *Transactions* of the Institute illustrate the truth of this keen, discriminating observation. Some of their most valuable papers have come from men who could not have claimed membership in more "select" societies, and who wrote, not because they were already known, but in order to make themselves known.

At all events, the force of circumstances dictated, and the experience of thirty-five years has approved, the decision which admitted to membership in the Institute all persons trained for, or practically connected with, the professions and industries which it represented.

But this decision involved the simultaneous adoption of another. In 1871 (and the same is true to a more limited extent to-day), the American mining engineer had to know many things besides mine engineering proper. He was expected to do, or intelligently to superintend, the work of assaying, milling, smelting and general construction and management. Moreover, a man who was running the mine to-day might be superintending the furnace to-morrow. Hence it was found both advisable and practicable to include in the membership of the Institute those who were connected with geology, chemistry, and civil, mechanical or electrical engineering, as applied to mining or metallurgy.

James Gayley, President of the Corporation and Past President of the Council of the A. I. of M. E.

The American Society of Mechanical Engineers and the American Institute of Electrical Engineers are both younger than our Institute, and, in some sense, its offspring. They have fields of their own, which they most creditably occupy; yet great numbers of their members still seek or retain membership in the Institute of Mining Engineers, and the Institute has had no reason to close the doors once opened to such candidates.

The original scheme of the Institute led to an unprecedented growth, both at home and abroad. The mem-

bership increased rapidly from year to year, and now numbers more than four thousand names, distributed throughout the world. This forced upon the management two additional problems: one of government; the other of policy.

The meetings of the Institute were, from the beginning, peripatetic. Nothing else could have prevented its degeneration into a local organization, or kept alive the national sympathy necessary to its success. Until its incorporation in 1905, it had no official headquarters aside from the office of its secretary, which had been located, without any official action, wherever the secretary happened to reside—first at Lambertville, N.J., then at Philadelphia, then at Easton, Pa., and finally at New York. It was manifestly impracticable to leave the decision of business questions to the vote of such members as might happen to attend a meeting in some particular locality. Consequently, almost absolute powers were given to the council, chosen annually by postal ballot.

But such a grant of absolute power demands a precise limitation of its sphere; and accordingly the council of the Institute was prohibited from any act or utterance outside of the management of the proceedings of the society itself, namely, the holding of meetings and the acceptance, publication and distribution of papers. Gradually it came to be recognized that the Institute itself, as represented by the members attending a given meeting, was still less competent than its representative council to express opinions or approve of any kind outside of its own immediate affairs; and the final result was the present rule:

"The Institute shall not assume responsibility for any statements of fact or opinion advanced in the papers or discussions at its meetings. Neither the council nor the Institute shall officially approve or disapprove any technical or scientific opinion or any proposed enterprise, outside of the management of the meetings, discussions and publications of the Institute, and the conduct of its business affairs by the board of directors."

This policy is not only approved by our experience, but also founded in a correct theory of the relation of the Institute to its individual members.

A man who joins the society for the sake of the benefits offered by its publications and its fellowship* has a right to the assurance that neither his name, his money, nor the influence of the organization which both his name and his money have strengthened, shall be used to promote any outside cause whatever. No matter how ignorant or prejudiced he may be, he is entitled to be protected against unwilling partnership in an opinion, or a movement, or an enterprise which he has not contemplated.

Several instances from the earlier history of the Institute will further illustrate this principle.

In the first decade there was a brilliant discussion before the Institute of the question "What is Steel?" and in 1876 an international committee of high distinction reported for our adoption a new nomenclature for the products of the iron blast furnace, the Bessemer converter, the forge and the crucible. But, underneath the technical questions involved, there were important questions of tariff classification, involving, perhaps, millions of dollars; and a sweeping decision of the Institute on either side of the case would have been used in argument before the United States Treasury Department, to the injury of the business interests of many members. This result was wisely averted by a refusal to promulgate any such general decision.

Later, there was a memorable debate, concerning the metric system of weights and measures, on a resolution recommending Congressional legislation to make this system obligatory. Here, again, the proposition was passionately opposed by members whose business interests would, at least in their own opinion, be injuriously affected by it, as well as by those who, on principle, disapproved it. In this case, the speeches on both sides were reported in the *Transactions;* but when the time came to vote on the resolution itself, the presiding officer declared it to be out of order, as not included in the declared purposes of the Institute, and, therefore, declined to put it to vote. This decision, sustained by the meeting, may be said to have settled, once for all, the principle which, after several similar precedents, was formally embodied in the rules already quoted.

United Engineering Societies Building.

It is evident that no rule of this kind could be enforced if there were any recognized distinction as to the merit of the scheme or proposition seeking support. Such a scheme or proposition, if of such a character as, almost

*I must be content with a mere passing notice of the advantages of this fellowship, which has proved in innumerable cases the sufficient motive for a frank interchange of information, quite outside of the formal published papers and discussions. It has been for many years my practice as secretary to refer members desiring information which I did not possess to other members who had it. And I can recall no case in which such an appeal did not meet a courteous response.

beyond doubt, to command the hearty assent of all members, would surely constitute an excellent precedent and illustration for the support of the existing rule.

Ever since the Institute became successful, influential and widely known, innumerable attempts have been made in entire good faith, to secure the aid of its name and authority for propositions honestly believed to be (as, in most cases, they were) meritorious. Recommendations that Congress should make appropriation for the representation of the United States mineral industry at this or that exposition at home or abroad; that the Institute should unite with this or that society to form a joint committee on national or international standards, etc., have all been "turned down"—the more meritorious, the more promptly. It was the only way to preserve our plan and purpose.

This statement may explain why the Institute and its officers, as such, have taken no part in the successive meetings of the American Mining Congress, with the purposes of which a large number of our members are in sympathy.

I feel bound to add that the restricted policy above outlined has had somewhat unexpected and most gratifying results. The Institute has been the forum, and its *Transactions* the records, of the free discussion of nearly every important and pertinent question connected with

The Auditorium.

the progress of modern engineering. Expressing no opinions, we hear all, and furnish to the proposer of any reasonable novel view an appreciative audience. And no student of the practice of the last thirty years in any department represented by our membership can afford to overlook the authoritative and suggestive contributions made by us to the technical literature of this generation.

There are many other features of the history, tradition, and consequent present administration of the Institute, concerning which I would gladly speak, and feel myself exceptionally qualified by circumstances to speak; but I cannot thus add to the present sketch, which, I venture to hope, has explained (and even justified) the three leading peculiarities of the Institute, namely:

1. Its wide and liberal conditions of membership.
2. Its absolute government by a central body—*i.e.*, its representative, rather than purely democratic, organization.
3. Its strict limitation of the functions and powers, both of the governing body and of the Institute as a whole.

Each of these features has been often criticized, usually in perfect good nature and good faith. I shall not now undertake to offer any further defense of them, not incidentally implied in the foregoing explanation. But I think I may fairly claim to have shown that they came into existence as the natural and necessary results of the conditions attending their origin. Even if something better might have been imagined, nothing better could have been done.

Finally, may I not modestly, but confidently, claim that the results of this enterprise, whatever may have been the defects of its plan, have been, somehow or other, such as to warrant us in "letting well enough alone?"

THE VALUE OF A MINE

By J. B. Tyrrell, Mining Engineer, Toronto, Ont.

(Continued from June 15th.)

We have seen that investment in mining securities, if judiciously made, must allow for the redemption of the capital invested within a stated time, as well as for the payment of interest on that capital at a rate commensurate with the risk incurred

In Canada rates of interest that would be considered fair and reasonable for a mining investment, keeping in view the many possibilities of loss, would vary from seven to twenty per cent. Many men who buy mining shares are looking to make a hundred per cent. within a few weeks, but these people are not investors, they are gamblers, some of whom will be allowed to win in order that many more may be induced to stake their money on the same gaming tables.

In addition to the above rates of interest, the dividends must include certain sums which for a term of years should be credited to a sinking fund for the repayment of capital, and the question of how many years should be allowed for such repayment must be kept constantly and clearly in view, or the investor will be certain to drop back into the idea that dividends are interest and nothing else.

In some large producing mines and more especially in the gold mines of the Transvaal, where the tonnage and value of the reef can be closely calculated, the length of time that it will take to exhaust the property and the net profit that will be realized during that time, are known. For instances, the Robinson Mine, one of the greatest gold mines of the world, is capitalized at £2,750,000, or $13,337,500, in 550,000 shares of £5 each. This mine is stated to contain a body of ore which will yield about $42,000,000 in dividends, and which can be extracted in twelve years, when the mine will be exhausted. In twelve years, therefore, this mine will pay back its capital of $13,337,500, with interest at 19 per cent., 3 per cent. being credited on the dividends as they are paid from time to time. At the present price of the shares, namely, £8.5, or $40, the actual capital is $22,000,000, and the mine, before its exhaustion, will pay this back with interest at 9 per cent.

In most producing mines a certain quantity of ore is blocked out on three or four sides ahead of production, as much as the management expects to extract in two, three or four years, as the case may be. The quantity and value of this ore is known with a reasonable degree of certainty, while for the rest the investor must be satisfied with the best estimate that he is able to obtain. Let us assume that the mine is capitalized at one million dollars in shares of $1 each; that after careful examination and sampling it is found to contain ore blocked out which will yield a net profit of $900,000; that the

ore which is not blocked out is estimated to yield profits of $1,300,000; that the estimated time in which this ore can be extracted is ten years; and that the plant at the end of this time will be of no value. During the ten years it will pay $220,000 a year, or an annual dividend of 22 per cent. As there is such a large body of payable ore blocked out and proved, making dividends to almost the full amount of the capital certain, the investor might probably be satisfied with 8 per cent. interest. On this basis, and allowing as before 3 per cent. interest on all money paid as dividends, the present value of this mine is $1,315,000, and the shares are therefore worth $1.32.

If all the ore could be extracted from the above mine in five years instead of ten, it would be yielding profits of $440,000 a year, or dividends at the rate of 44 per cent. on the capital, but still on account of the deduction of 20 per cent. each year from the dividend for the repayment of capital, the shares would only be worth $1.64.

If on account of the installation of new plant or for other reasons the first dividend should be deferred for two years, and should then continue for ten years thereafter, the shares would be worth $1.13.

Another mine is capitalized at $1,000,0000, in $1 shares. It contains 4,000,000 tons of low grade ore, say of one of the baser metals, which will take twenty years to extract. At the present price of the metal a profit of $1.50 a ton could be realized. What the price of the metal will be a few years hence it is imposisble to predict; it might drop so that the mine would be unprofitable and would have to be closed down. In the case of an investment in such a mine the risk of loss would be great and a corespondingly high rate of interest should be demanded, probably 15 per cent. and possibly 20 per cent. At the former rate the shares are worth $1.60, and at the latter rate $1.26.

Again, a mine is capitalized at $1,000,000 in $1 shares. It contains ore which will yield a net profit of $300,000 blocked out, and this ore can be extracted in two years. Beyond what has been blocked out, very little payable ore is to be seen, and though there may be much ground on the property which would seem to be worth prospecting, the possibility must be recognized that this ground may prove unproductive and at the same time part of the profits derived from the ore blocked out may be used up in prospecting it. In this case the only sure profit is the $300,000. This, allowing interest at the rate of 10 per cent., is worth $253,000, giving a value of 25 per cent. per share for the stock. Any price paid above this is purely speculative, paid on the chance that more payable ore will be found on the claim. The purchaser who pays, say 70 cents a share, should therefore fully understand the risk that he has taken and should not complain, or blame the mining industry, if when the mine is exhausted he finds that he has lost most of the money that he invested in it.

Examples of mine values might be multiplied indefinitely, but the above will give some idea of the principles which should guide the investor in mining stocks if he wishes to place his money with reasonable certainty of good returns.

The investor has to be taught that a proper estimate of the ore reserves—in their relation to the mine's market valuation—is the real fact to grasp. If people neglect this fact they will, in the long run, lose by buying mining shares.

As a rule every man considers himself competent to invest in mines, but it is worth recording here that professional rather than amateur knowledge on this subject, as on all other subjects, is more likely to stand the test in the long run.

THE INSTITUTION OF MINING ENGINEERS

The forty-sixth annual meeting of the Institution of Mining Engineers opened on the 13th of June at the rooms of the Geological Society, in London. Mr. Maurice Deacon, the president, in the course of an address gave a brief history of the Institution, which was formed in the year 1889 with the object of broadening the sources of information upon matters affecting the profession of mining engineering by amalgamating the several mining institutions of Great Britain into one consolidated body. With the exception of two societies, the South Wales Institute of Engineers and the Institution of Mining and Metallurgy, which continue as independents organizations, the object of the Institution has been attained. It now has a membership of 2,972 federated and 73 non-federated members, representing an increase of membership in fifteen years of over a hundred per cent., whilst the financial showing is also satisfactory, subscriptions having increased nearly 170 per cent.

The address refers to recent legislative enactments in Great Britain affecting the mining industry, and especially deprecates the passing of the Workmen's Compensation Act, in consequence of which, it is feared, costs will be increased by the largely advanced premiums that insurance companies are demanding upon their present scale. Among other items of mining legislation promoted in Parliament, the following bills are mentioned:—The Coal Mines Regulation Bill, Engines and Boiler Bill, and two bills for limiting the period of working underground. In reference to the foregoing, Mr. Deacon points out that the proposal to again disturb the Coal Mines Regulation Act appears to be unnecessary and undesirable, and likely to introduce fresh difficulties in the management of mines, coupled with an increased cost of production. The proposals of the Eight Hour Bank to Bank Bill are fraught with danger, not only to the British industries and the public in general, but to the men in whose supposed interest the bill was introduced. At the present time few men work over eight hours a day, but by the passage of the Act the time available for coal-working would in many cases not exceed six hours a day, and in those mines where the working face is situated a long distance from the pit bottom, probably not more than five and a half hours a day. To quote Mr. Deacon: "The effect of such a serious limitation . . . would be to so seriously increase the cost of production that those industries which are of necessity large consumers of coal, especially the iron and steel trades, would be injuriously prejudiced in competition with other countries, to the grave detriment of the trade generally. . . To what extent the price of fuel would rise it is, of course, impossible to suggest, but that a reduction of 20 to 25 per cent. in the output, which would probably accrue, would result in a great scarcity of coal, and that such a scarcity would create a considerable rise in the price cannot be questioned." Mr. Deacon stated that some years ago he made an experiment to test the practical result of a limitation of hours of working, and found that the output of a certain colliery was reduced by 27 per cent. below the output obtained on a normal day of nine hours' winding.

Allusion was also made in the address to the increased progress that has been made of late in the mechanical engineering of British collieries. Thus, in seams which

are worked to the dip, mechanical haulage has replaced the employment of horses, and in Warwickshire, where several seams are worked in conjunction with one another and brought to one main gate road, it is the custom to employ a small haulage set on every gate road, as well as on the subsidiary levels or cross-gates. Economies have also been effected by the use of steel props and girders, while electric cutting machines have been largely adopted of recent years in seams of varying thicknesses and conditions. In some thin seams conveying belts are in use along the working face to the gate ends, where the height is insufficient to permit an ordinary car to be loaded, and heading machines, by which as much as 36 yards of coal heading per week has been cut, have also played an important part in mining thick seams.

The improvement in the surface mechanical equipment of collieries is stated as being still more marked. For example, by the use of high pressure steam, coupled with more economically designed engines, by the greater use of expansion gear, and sometimes by super-heating and condensing, the steam consumption of modern collieries has been greatly reduced. Winding engines which formerly consumed 70 or 80 pounds of steam per indicated horse-power may now be found using not more than 30 pounds whilst continuously running engines and steam turbines, for fan and electric driving, are in some instances working with not more than 14 or 15 pounds of steam per indicated horse-power.

There is, perhaps, no greater necessity in connection with the working of a colliery than the provision of pure boiler water, and British colliery engineers have of late given considerable attention to the treatment of impure water to fit it for boiler use, while, too, the better utilization of the calorific value of fuels by the use of gas producers and gas engines has not been disregarded, and in the case of plants of 1,000 kw. and upwards, working costs as low as 0.25d. per kw. have been obtained.

The address concludes with the following pregnant paragraph:—

"The careful consideration of economies in fuel for colliery purposes becomes increasingly important by reason of the greater depths from which the coal of the future will of necessity be wound. The question of raising large quantities of coal from depths of 2,500 feet to 3,000 feet, which will have to be confronted on a large scale at an early date, opens up a fresh field for the exercise of the ingenuity of the mining engineer. In the case of collieries sunk to such depths, where only one workable seam is available, very large areas, probably not less than 18 to 20 square miles to each pair of pits, will be necessary, to warrant the heavy capital expenditure entailed in sinking and equipping plants of the magnitude which will be necessary to raise the large quantities of coal required to produce a low cost and enable a reasonable return to be made upon the large capital involved."

THE NEW TILBURY AND ROMNEY OIL FIELDS OF KENT COUNTY, ONTARIO

By Eugene Coste, E.M., Toronto.

(Toronto Meeting, 1907.)

Oil was first struck in the new Tilbury field in December, 1905, on the John Kerr farm in the northwest part of lot 10 of the Middle Road, North Range of the Township of Tilbury East, in the County of Kent, Ontario. The first well as drilled by the Acme Oil Company of Detroit. This company had been operating unsuccessfully in the narrow Leamington pool in the adjoining County of Essex. Before finally abandoning its venture in oil it decided to take another chance, and this time of a purely "speculative" nature, as the location selected was in an entirely new and undeveloped territory. As luck would have it, it turned out to be a winning throw. At the depth of 1,360 feet a rather strong gas vein was struck; then another at 1,375 feet; then the first oil pay with more gas at 1,385 feet; then a second oil pay at 1,410 feet and a third one at 1,430 feet. A little below that some salt water was found and the drilling was stopped at 1,450 feet. The well after the shot started to flow at the rate of 40 barrels of oil per day, the gas being quite strong, about half a million cubic feet per day.

The second well was drilled in at the end of March, 1906, on the Janes farm, about three-quarters of a mile southwest of the first well. It struck gas and oil at about the same depths, but it proved to be a small well, not starting at better than eight or ten barrels per day after the shot.

The third well was completed on April 6th, 1906, on the J. Smith farm, half a mile southeast of the first well, and it started at the rate of sixty barrels per day after the shot; the first gas was struck at 1,363 feet and the first oil at 1,393 feet; the second oil at 1,418 feet and the third pay of oil, which was the best, with some salt water, at 1,430 feet.

A great many other wells followed rapidly thereafter, and to date not less than 150 wells have been drilled. These prove that the good oil territory of the Tilbury field extends at least over an area of two miles east and west by five miles north and south, and the limits of the field to the south and north are still unknown. Only three or four dry wells have as yet been encountered over that large area of 6,400 acres, and a number of very good wells (century wells) have been struck. The largest of these is the A. Simard well of the Central Oil & Gas Company in the northwest part of the field, as at present developed, which started to flow naturally, that is, without being shot, at the rate of 1,500 barrels per day of fluid, 1,200 barrels of which were salt water and 300 oil. This well is now over two months old and is still flowing naturally about 200 barrels of salt water and 50

barrels of oil per day. The oil, water and gas were all struck at the same time at a depth of 1,445 feet. Only about 150,000 cubic feet of gas per day having been reached at the depth of 1,436 feet.

Large gas wells have also been struck in this field, the largest being the Volcanic Oil & Gas Company's well on the David Halliday farm in the northwest part of lot1 in the sixth concession of the Township of Raleigh, which adjoins the Township of Tilbury East to the northeast. Gas was struck at 1,417 feet, drilling being stopped at 1,421 feet in the middle of the gas pay, as the well was then measuring seven million cubic feet per day of dry gas. It was tubed with 3 inch tubing, packed with a Dresser packer and closed in on the 16th of September, 1906. The regular rock pressure of the closed-in gas was 650 lbs. to the square inch.

The gas from this well has since been piped to the City of Chatham, ten miles distant, where it would now be sold for 15 cents and 25 cents per thousand cubic feet, if, instead of facilitating the advent of such a cheap and incomparable fuel, an antiquated law known as the "Gas Inspection Act" (which declares that there should be no trace of sulphuretted hydrogen in any gas used for illuminating purposes) had not prevented its use by the people of Chatham for the greater part of this winter. Backed by the provision of this old law, some of the aldermen of the City of Chatham entertained the idea that this natural gas from the Tilbury field, which certainly contains some sulphuretted hydrogen, as evidenced by the smell of it, would poison the Chatham consumer. The writer mentions this matter here as he believes that it is the first time on record that this question of the supposed poisonous nature of natural gas has been raised on the introduction of it into a city. At the instance of the City Council of Chatham, this natural gas from the Tilbury field has just been analyzed by Prof. E. B. Shuttleworth, of Toronto, with the following results:—

Hydrocarbons, principally methane ...	92.20
Carbon dioxide	1.40
Oxygen	Trace.
Carbon monoxide	0.21
Hydrogen	4.40
Nitrogen	5.59
Sulphuretted hydrogen	0.20
	100.00

which compares as follows with the natural gas from Ohio and Indiana, according to analyses published by the late Prof. Edward Orton in his "Geology of Ohio," volume 6, page 137:—

TABLE OF ANALYSES OF NATURAL GAS FROM OHIO AND INDIANA.

Gas.	1	2	3	4	5	6	7
Hydrogen ...	1.89	1.64	1.74	2.35	1.86	1.42	1.20
Marsh gas ..	92.84	93.35	93.85	92.67	93.07	94.16	93.58
Olefiant gas	0.20	0.35	0.20	0.25	0.49	0.30	0.15
Carbonic oxide	0.55	0.41	0.44	0.45	0.73	0.55	0.60
Carbonic acid	0.20	0.25	0.23	0.25	0.26	0.29	0.30
Oxygen . . .	0.35	0.39	0.35	0.35	0 42	0.30	0.55
Nitrogen . .	3.82	3.41	2.98	3.03	3.02	2.80	3.42
Sulphuretted hydrogen .	0.15	0.20	0.21	0.15	0.15	0.18	0.20

LOCALITIES.

1. Fostoria, Ohio.
2. Findlay, Ohio.
3. St. Mary's, Ohio.
4. Muncie, Indiana.
5. Anderson, Indiana
6. Kokomo, Indiana.
7. Marion, Indiana.

It will be seen from the above analyses that, so far as the sulphuretted hydrogen is concerned at any rate, there is absolutely no difference between the Tilbury field gas and the Ohio and Indiana gas taken at a number of places widely scattered over these two States, and where it has been used for all purposes without the slightest harm to anyone for a great many years by thousands of people. It is clear, therefore, that our gas inspection act is onerous and needs to be amended to permit in Canada the use of natural gas for domestic and other purposes, as unrestrictedly as it is used in the United States. It is clear, also, that the City Council of Chatham has been altogether too particular in its acceptance of so well and so favorably known an article as natural gas.

The oil of the Tilbury field also contains some sulphur, which gives it a strong odor peculiar to the crude oil known in the States as "Lima" oil. It is a dark green in color, of 38 to 41 degrees Baume gravity, and belongs to the same class as the Lima, Ohio, the Indiana, and the Petrolia and Oil Springs (Ontario) oils. It is bought from the producer at the present time only by the Imperial Ail Company of Sarnia, Ont. This company has established a pumping station and tankage in a central part of the field, from which it pumps the oil through a 4 inch and also through a 2 inch line owned by them to Merlin, Ont., on the Pere Marquette Road, four and a half miles distant. From there the oil is taken over that road in tank cars of the Imperial Oil Company to their large refinery at Sarnia. The oil is bought by the Imperial Oil Company at the tanks at each well, and they pay at present for it $1.14 per barrel. After the oil has been accepted and the tank has been gauged, the oil is run by means of a donkey pump through 2 inch lines owned by the Imperial Oil Company to their tanks erected at the central station. The well tank is again gauged after the run and the different in the two gauges gives the amount of oil sold, for which the Imperial Oil Company gives the producer a run ticket and also a vouched ticket. in order to enable him to collect the Government bounty of 52 1-2 cents per barrel. The total price, therefore, at present obtained by the producer for his oil is $1.66 1-2 per barrel, less the royalty, generally one-eighth to the owner of the land, the oil and gas rights of which are generally only leased by the producers. Two years ago, before the Dominion Government removed the import duty protecting Canadian crude oil, the average price of it in Canada was, for the previous year, $2.12 . By the bounty system, therefore, versus the duty system, the net result is a loss to the oil producer of $2.12 less $1.66 1-2 or 45 1-2 cents per barrel, and another loss to the Dominion Government of 52 1-2 cents per barrel, while the refining companies make all the gain, which I am not aware that they share with the consumer. With the duty removed they can now obtain their crude oil cheaper from the States, so much so that the Canadian Oil Company, the only independent refiner now in Canada, gets all its supply of crude oil from Ohio and, the writer believes, buys no Canadian oil from any of the fields, certainly none from the Tilbury field. The price of Canadian oil is therefore governed and controlled by the American market, while the Canadian producer

operating in the deep fields is at a disadvantage in being called on to pay a heavy duty on his drilling outfits, machinery, cordage, tubing, lead lines, etc. As mentioned above, the oil in the Tilbury field is in a deep sand (about 1,400 feet), and consequently all the drilling done there is done by the American cable tool system; the Canadian pole tool system being too slow and not suitable for wells of that depth. These American cable tool outfits cannot be obtained in Canada, nor can the 1,500 pound test 2 inch tubing, and other 2 inch high pressure lines which the Tilbury field producer must have, and on all of this he must pay a heavy import duty. It is quite clear, therefore, that the Canadian deep oil producer would receive greater encouragement to test and develop deep oil fields in Canada if he had no duty to pay on his materials, which he necessarily imports from the States; and if the price of his product was protected at present receiving a bounty on his product from the by an import duty on American crude oil instead of as Dominion Government, which he practically returns in the form of duty on his equipment, while at the same time his price is slaughtered in competition with cheap American crude oil.

Geology.—The Tilbury oil and gas field lies under a flat drift-covered section of the country, the elevation of which is about 600 feet above the sea. The drift is about 150 feet thick in the south end of the field and about 100 feet in the north end, and is composed of boulder clay on the top and sands and gravels varying very much in thickness below. The first strata struck under this drift are the grey blue shales of the Hamilton or Middle Devonian formation—the so-called upper soapstone or soap of the Petrolia driller; then comes the middle lime and the lower soap of the same formation, followed by the Corniferous or big lime of the Lower Devonian, which is struck at depths ranging from 230 to 285 feet, and is about 150 fee thick. Below this are the Dolomitic limestones with flint and gypsum of the Onondaga, or Upper Silurian, a little more than 1,000 feet thick; then comes the Guelph and Niagara, Silurian dolomitic limestones in which, so far, the drilling of the wells has been stopped, but it is likely that, in future, in some parts of that field or not far from it, the wells will be drilled deeper still and will obtain their gas and oil either from the Clinton limestone immediately underlying the Guelph and Niagara, about 150 feet thick in that section of the country, or from the still deeper strata of the Trenton limestone, lying about 900 feet under the Clinton, from which it is separated by the Medina, Hudson River and Utica soft shales, which can be drilled through very quickly and cheaply.

The gas and the two upper oil pays in the southern part of the field are found in the lower brown dolomites and gypsum of the Onondaga, while the lower oil pay is struck in the upper beds of the Guelph and Niagara. In the north end of the field, north of the Michigan Central Railway, the lower beds of the Onondaga are barren of oil, which is there altogether found in the Guelph, but the gas is still found there in the lower beds of the Onondaga in the strata which form the first and second oil pays of the south end of the field. In the east middle part of the field, on the other hand, the oil is struck in the Onondaga strata which constitute the gas pays in many of the wells of the middle western part of the field, such for instance, as at the J. W. Campbell No. 1 well of the Central Oil & Gsa Company, the log of which is here appended:—

LOG OF THE CENTRAL OIL & GAS COMPANY'S WELL NO. 1.

(S.E. corner of Lot 6, in the 9th Concession of the Township of Tilbury East, Kent County, Ont.) Elevation 600 feet A. T.

Formation	Description of Strata.	Thickness feet	Depth feet	Remarks
Drift	Boulder clay	95 to	95	A little gas.
	Grey sand	5 to	100	10″ drive pipe to
	Clay and gravel ...	28 to	128	138 feet.
Hamilton.	Blue clay shoal (upper soap)	37 to	165	
	Middle lime	10 to	175	
	Blue clay shoal (lower soap)	67 to	242	
Corniferous or Big Lime	Yellow limestone..	158 to	400	8″ casing to 343 ft. A show of oil at 250 ft.
Onondaga .	Grey, drab, brown and blue dolomites with gypsum and flint (shaly, series with darker shaly dolomites & more gypsum from 835 to 1185)	1020 to	1420	6½″ casing to 835 ft. Gas at 1250 ft. 1362 ft. 1370 ft. 1376 ft. 1382 ft. Oil at 1397 to 1400 ft. and at 1416 ft.
Guelph . ..	Blue white dolomitic limestone	9 to	1429	Oil at 1426 ft.

A little gas is also often found in this field in the sand or gravel at the bottom of the drift, also in the upper part of the Corniferous in some of the wells, while in other wells some gas and a little oil were found in the upper beds of the Onondaga between 500 and 600 feet. There is also another vein of gas in some of the wells at about 1,250 to 1,280 feet in the Onondaga, all of which shows the adventitious nature of the gas and oil in the different porous strata or reservoirs of this field, which does not in this differ from many other oil and gas fields. This fact, as I have shown in one of my papers before this Institute ("The Volcanic Origin of Natural Gas and Petroleum," Vol. 6 of the Journal of the C. M. I.), that gas and oil always impregnate the porous portions of the great thicknesses of strata from the Archean to the drift, many of which strata are very impervious, constitutes one of the very strong proofs of the volcanic nature of these products. For other proofs of the volcanic origin of oil and gas, reference may be made to the above mentioned paper, the arguments in which have not yet been successfully refuted.

The Romney oil field, or rather pool, as it is yet only about three-quarters of a mill long and only a few hundred feet wide, is situated some seven miles southwest of the Tilbury field in the north parts of lots 21, 22 and 23 in the 4th concession of the Township of Romney, Kent County, Ont. It is only a few months old and there are now seven producing wells in it, several of which came in as very large wells, making each over 1,000 barrels per day of oil. The oil is struck at the shallow depths of 200 to 270 feet, in the upper part of the Corniferous formation or Big Lime, the top of which is struck there at 180 feet. The oil is heavier than the oil of the Tilbury field, about 28 to 30 Beaumé. It is piped and shipped from Coatsworth station on the Pere Marquette to the Sarnia Refinery of the Imperial Oil Company, which now pays 84 cents per barral for it at the wells.

Five miles further southwest again, in lot 11 of the 2nd concession of Romney, oil was struck some few years ago in the Guelph formation at 1,290 feet. The wells were pumped for quite a while, but abandoned on account of their making too much salt water with the oil.

It will be seen from the facts presented above that a great many other interesting oil and gas developments are to be anticipated in the near future from this district, and in fact from many parts of the County of Kent and of several of the neighboring counties.

NOTES ON THE MINERAL FUEL SUPPLY OF CANADA

By R. W. Ells, LL.D.

(Abstract of paper read before the Royal Society of Canada.)

(Continued From Page 245.)

Farther west the rocks of the mountain chain belong to an older series than those which contain the coals; but the next division westward from the vicinity of Sicamous, although for the most part igneous in character, contains isolated basins, generally of Tertiary rocks, which carry coal beds often of large extent and thickness. These are found at widely separated points, such as the upper part of the Peace River, the valley of the North Thompson, the vicinity of Kamloops, the Nicola valley, and the Tulameen and Similkameen district, all with the exception of the two first being situated to the south of the Canadian Pacific Railway; while to the north are the areas along the Marble canyon at Hat Creek, a few miles northwest of Ashcroft, and the Bulkley valley deposits farther north, situated to the south of the Skeena River. Most of these coals are of the coking variety, while the lignites are of excellent quality.

On the Pacific coast the great Cretaceous deposits on Vancouver Island have been mined for nearly half a century. Farther north, on Graham Island, which is the most northerly of the Queen Charlotte group, anthracite, high grade bituminous and lignite are found. This field promises to be of great value.

The occurrence of these several varieties of coal in rocks of practically the same geological horizon is interesting, since it is probable that at one time all these newer coals existed in the form of lignite. It has been pointed out that as we approach the foothills from the plains, and thence continue westward into the mountain range at Crow's Nest and at Banff, the percentage of water in the lignite gradually diminishes and the coal passes through lignitic coals into bituminous and thence to semi and true anthracite. The alteration of the coals is due to a large extent to heat induced by pressure during the epoch of mountain-making.

Though the change in character of the coals may also, to some extent, be due to the relative position of the seams in the section, still the difference in character does not depend entirely upon the geological horizon, since in the interior basins of British Columbia many of the Tertiary coals are highly bituminous instead of lignitic, while on Queen Charlotte Island the Cretaceous coals range from high grade bituminous to broken and shattered anthracite.

The thickness of the coal-bearing strata along the eastern side of the Rocky Mountains aggregates several thousands of feet. In a section published by Mr. J. McEvoy, the total thickness of the coal-bearing formation exposed along the Elk River amounts to 4,736 feet, and the coal seams exposed have a total thickness of 216 feet. The thickest beds in the section are 36, 46 and 46 feet respectively. Along Michel Creek, on Morrissey Creek, and near the divide between Elk and Fording Rivers, large workable seams have been found. It is evident, therefore, that the quantity of coal on the Crow's Nest basin is inexhaustible, the amount estimated by Mr. McEvoy for an area of 230 square miles, owned by the Crow's Nest Company, alone being no less than 22,595,200,000 tons.

In the Banff district, where are the Canmore and Anthracite mines, about fifteen seams have been recognized. The geological formation is Cretaceous. Beds of semi-anthracite have been opened up having thicknesses of 12 to 15 feet. These coals extend northward to the upper waters of the North Saskatchewan and Peace Rivers.

Between Crow's Nest and Banff and northward near the upper waters of the Peace River, large coal seams have been reported. So far no trace of coal has been found in sediments of Carboniferous age.

The coal areas of Vancouver Island have long furnished the Pacific coast of British Columbia and as far south as San Francisco. The coals, which occur on the east side of the Island are high grade bituminous and of Cretaceous age. The mining centres are confined to Comox, Nanaimo and Ladysmith. The seams frequently vary in thickness from three or four feet to fifteen or twenty feet.

On the mainland of British Columbia the coals are bituminous rather than lignitic, though the latter is also found both as lignite and as lignitic coal.

The Nicola coals are bituminous coals, yielding on excellent coke. These coal areas, lying about fifty miles south of Kamloops, will doubtless supply a large part of British Columbia's demand.

The high grade coking coals of the Tulameen and Similkameen districts are similarly of great importance. Good coal, both bituminous and lignitic, is found in several other districts.

Both lignite and true coals are found in Northern British Columbia, both south of the Skeena River and Northward at intervals into the territory of the Yukon. Probably the most important occurrence is on the Telkwa River in the Bulkley Valley, where five seams of coal, from 2 1-2 to 20 feet in thickness and of excellent quality, have been found near the proposed line of the Grand Trunk Pacific Railway.

In the Yukon district coals of good quality have been found. There are several seams exposed on Cliff Creek on the Klondike River, and it is estimated that an area of 200 square miles is underlaid by coal.

The Colliery Guardian, May 31st, makes the following comment on the Canadian Industrial Disputes Investigation Act of 1907: "As regards taking proceedings under the Act, it is at present left to any private individual to lay the necessary information. This, perhaps, explains why the miners of Fernie, B.C., recently went on strike even while a Board of Conciliation and Investigation was being constituted. Neither shall we know, without further experience, how far the Act will effect the purpose for which it is intended, for in the case of the Fernie strike an agreement was speedily arrived at. Both in New Zealand and New South Wales similar efforts to prevent strikes by force of law have given rise to grave constitutional difficulties."

THE GOLD MINING INDUSTRY OF NOVA SCOTIA

By E. Percy Brown, S.B.

The accompanying diagram, taken from the Report of the Department of Mines for the Province of Nova Scotia for the year 1906, is interesting as showing in a graphic way the very unsatisfactory progress of gold mining in Nova Scotia during the past forty-four years.

Many excuses have been offered for the fact that instead of a steady and healthy growth the industry has suffered severe setbacks at times, and during the past five years, when the mining industries of most countries have been booming, the gold production of Nova Scotia has steadily decreased.

One authority states that the large mines are carrying on development work only, while they are extending and enlarging their plants preparatory to increased production.

Others state that the days of the small, rich, nuggety lode with a large yield per ton, but a correspondingly large cost, are passing away and that more attention is being devoted to the low grade and larger deposits from which, though the gross yield may be less, the net return is greater.

Such excuses, though doubtless partly true and perhaps sufficient for the layman, are recognized by every mining man as but poor ways of explaining the present status of the industry.

The first discovery of gold in Nova Scotia is said to have been made at Tangier in the year 1860. There was considerable excitement over the discovery and prospectors flooded the country.

Gold was found in so many different places during the next few years that it was thought that the whole Province was auriferous.

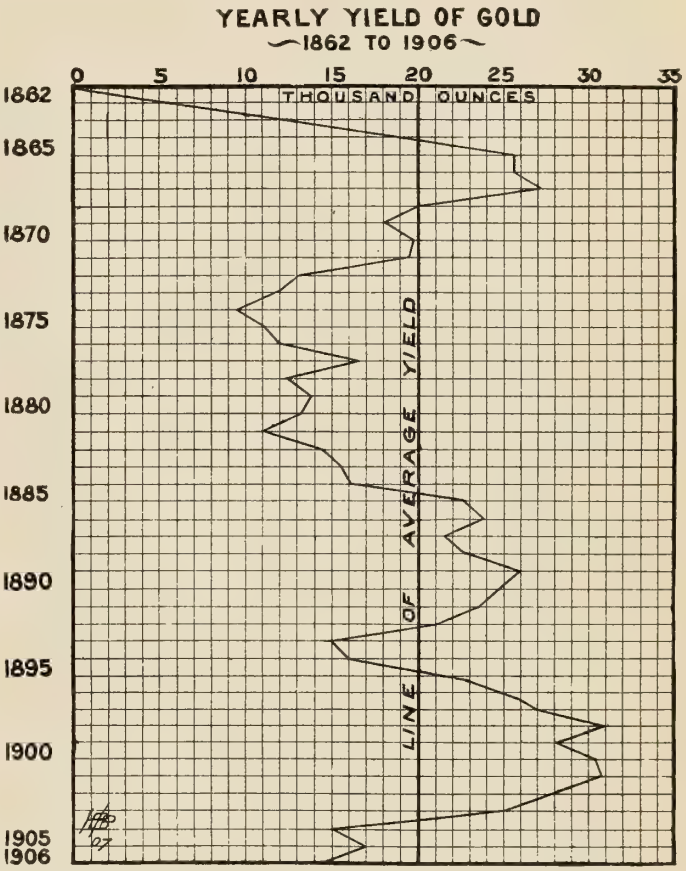
The conditions under which mining was carried on can be realized when we read that at Tangier during the year 1860-61 no less than 100 small areas 20 by 50 feet were laid out and that as many as six hundred men were actively engaged in prospecting. It is said that during this time twelve gold-bearing lodes were opened up in this district. Many shafts were sunk on the different veins and the rich outcrops removed in any way that seemed easiest at the time without regard to the future.

This system of granting areas only 20 feet along the line of the lode initiated a system of mining in Nova Scotia which has remained almost to the present day.

Looking over the plan of Tangier gold district, as published by the Geological Survey of Canada, we find that six different shafts were sunk on one vein within a distance of 125 feet. On another lead, not more than 50 feet south of the one above mentioned, there are shown 10 shafts within a distance of 250 feet.

Tangier was by no means exceptional in this respect, for even after the size of the area had been increased to 150 by 250 feet this remained the usual system of mining in the Province.

In Montague gold district I have counted on one vein no less than seven shafts in 300 feet. In Malaga gold district on one lode 10 shafts are found in 450 feet, and on another 7 shafts in a distance of less than 350 feet.



Many other instances might be given, but these will suffice.

The method of mining consisted in sinking a shaft to a depth of, say 50 feet, and stoping the ore from the grass roots down on both sides of it to such a distance that the ore could be easily shovelled to the shaft. Then two new shafts were sunk on the vein on each side of the first opening, and the operation repeated until the extent of the workings got beyond the capacity of the owners, or the supposed limit of the ore had been reached.

It is easy to see how such a system, or lack of system, would bring early disaster.

In the first place the mine would become a gutter for all the water of the region, and secondly, if the length of the outcrop were limited, the mine would speedily be condemned, as it would hardly be possible under these conditions to discover any line of "pay streak."

It speaks well for the number of rich outcrops in the Province that the production, under such circumstances, kept up as well as it did.

DIAGRAM, Showing Annual Output of Gold in Nova Scotia from 1862 to 1906.

Nor does this crooked black line in the diagram tell all the story.

Miners who have worked in some of the richest mines in Nova Scotia, have assured me that they believe that in many cases the amount of gold stolen by the miners exceeded the amount obtained by the owners.

I have every reason to believe that this is the truth; and certainly the conditions under which the mines were worked gave every opportunity for dishonesty.

The gold in the ore mined was mostly coarse and nuggety. The general belief was, as expressed by a miner, "if you can't see gold when you spit on the rock it ain't worth mining."

On the underhand stopes, when the ore was passed from one shoveller to another, usually in a stream of water, the glitter of gold would quickly catch the eye, and rich nuggets would find the pocket of the dishonest workman.

The ore was hoisted in small tubs up the humerous shafts to the surface, where it was washed and sorted, the idea of management being that the poor ore should be sorted out and go on the dump, whilst the good ore was sent to the mill. It can be seen that the "deckman" thus had as good opportunity to dishonestly increase his wages as his brother in the "pit." This matter of stealing gold became, in many districts, such a common affair that the miners began to consider they had a right to what they could find. Hence originated what was called "Miners' Rights," which was understood to mean that the men considered that what gold they saw belonged to them and what they did not see belonged to the company. Indeed, as recently as two years ago I was told that the reason why some of the men were leaving a certain mine and going to another nearby, where the pay was less, was because at the latter mine they had "Miner's Rights." Of course I do not mean to say that these so-called "Rights" were recognized by the company, but it was a matter of common talk among the men.

It may thus be seen that the Mining Society of Nova Scotia has good grounds for its agitation for the enactment of rigid laws for the suppression of gold stealing.

There is also another reason why we may justly believe that more gold has been mined than is shown by our records. No one can doubt that there has been a tremendous loss of gold by means of values escaping in the tailings from our stamp mills.

On the class of ore that we have been considering, namely, that containing nuggety gold, the loss in this way would not be large, but as the years went on another class of ore was discovered, some of which contained gold in a very fine state of division. In some cases the gold appears on the quartz or slate as though it had been laid on with a brush, in other cases where it is is hardly visible to the naked eye under a magnifying glass it resembles a springling of fine salt; and yet again, particularly where the ore, quartz or slate is heavily mineralized, the presence of gold cannot be detected except by assay or by mill test.

This class of ore is most important and deserves more attention than it has received in the past.

Two cases in particular of heavy losses in tailings from the treatment of ore of this class have come under my notice. In one case the ore contained about 2 ounces of gold per ton, and the loss of gold from the end of the plates was nearly 1 ounce per ton.

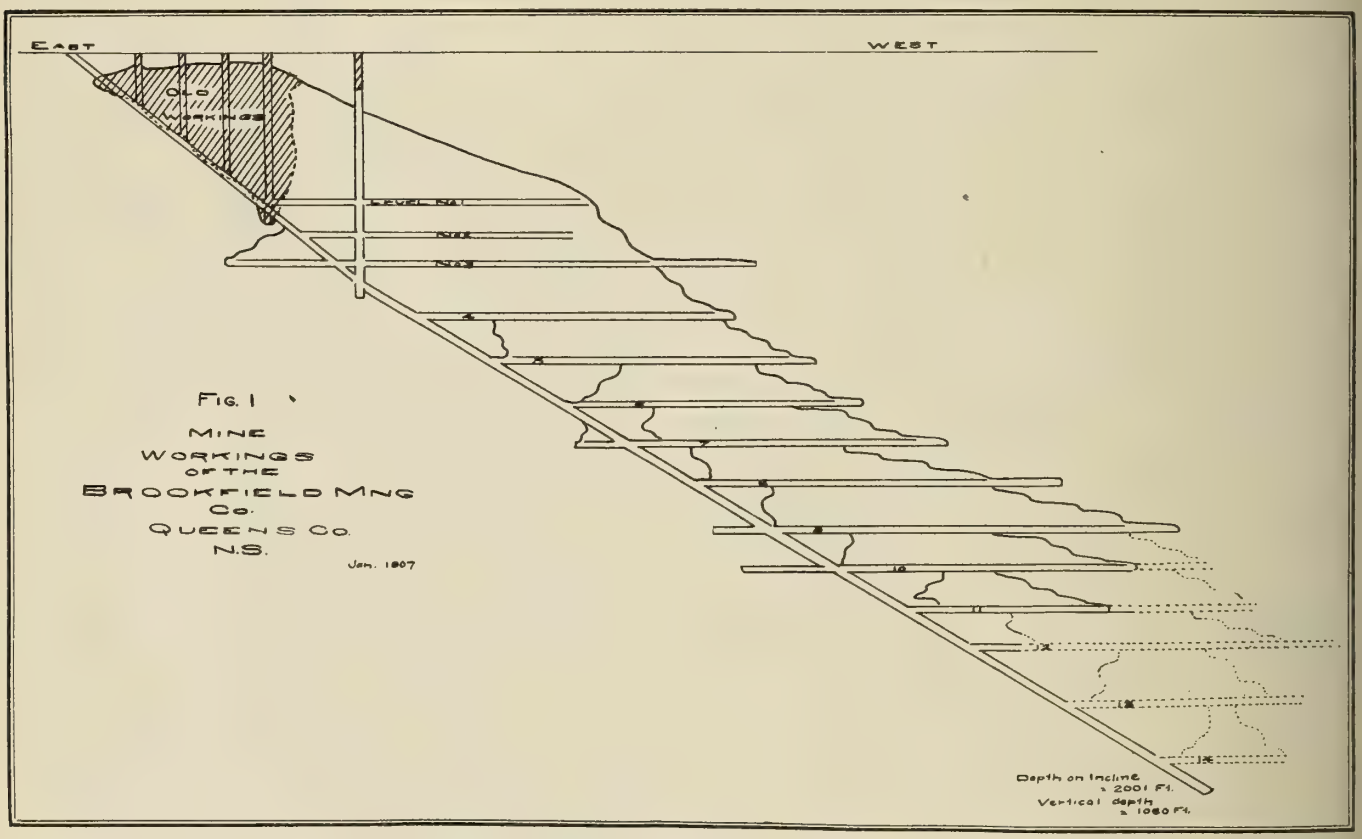


FIG. 1
MINE WORKINGS OF THE BROOKFIELD MNG CO. QUEENS CO. N.S.
Jan. 1907

Many amalgamators who read this will smile and say "impossible." That is exactly what was said by the manager of the property in whose mill this ore was treated, and he refused to be convinced until these tailings were treated chemically and a large portion of their values recovered.

In another case a company had been operating their mill for some time and obtaining what they considered satisfactory results, for they had, like the majority of gold mining companies in the Province, no means of ascertaining the amount of gold they were losing from their mill, and did not bother about finding out, as the mine was giving them a fair return on their money. However, the yield began to fall off, and dividends ceased. The manager in an inquisitive moment found some amalgam in the sluice. This combination of circumstances made him suspect that they might be losing some gold. The next month they sent a number of tons of their ore

to a neighboring mill. They were surprised to find that, whereas the ore crushed in their own mill gave them 8 dwt. per ton, the other mill returned about 12 dwt. per ton. Thinking that perhaps this difference might be due to a difference in the values of the ore treated, they repeated the test. They took great pains in arranging the distribution of the ore so that each mill should have the same grade of material to treat. The ore was a little better in this case. Their own mill gave 10 dwt. per ton and the other mill 15 dwt. They were loth to believe these results, but they seemed to warrant further investigation. They engaged an assayer to come to them for a week and take samples from the tailings of both mills. Their bewilderment increased, and they refused to believe the assayer, when he reported that even the mill which was making th better saving was losing values at the rate of 3 dwt. per ton. A cyanide plant was erected on this property later, which amply demonstrated the facts by not only paying for itself, but almost paying for the whole mine during the first year of its operation.

These are but two cases. We cannot doubt that throughout the whole Province there have been many others.

The saving of the values in the concentrates by the Boston Richardson Mining Company during the past year (CANADIAN MINING JOURNAL, June 15th, 1907) furnishes an example of what would have been lost even on a low grade proposition. But all the foregoing merely tends to show how much gold has been mined and should have been recovered from the mines of Nova Scotia.

The reader may justly say: "Well now, why, with all your improved methods of mining and milling does not the yield of gold increase instead of falling off year by year?"

One authority says, lack of prospectors to find new ore bodies; another, the high price of coal; another, the gold mines of Nova Scotia are only surface deposits and have been exhausted. What our first friend says would perhaps tend to show that he believes what our friend number three says, and that it is no good trying to work the abandoned mines and that new surface deposits must be opened up.

Mr. W. H. Prest, a practical mining geologist, who has had a long experience in Nova Scotia, wrote a short article to *The Engineering and Mining Journal* some three or four years ago, in which he shows in a masterly way how very unlikely it is, from a geological point of view, that the portion of our gold veins, which happens to be exposed, at or near, the present surface of the ground, should be the limit of this pay ore.

It would indeed seem peculiar, considering the extent of erosion, which we know has taken place in this portion of the continent, if this erosion had stopped at a point just one or two hundred feet short of completely wiping out our deposits of pay ore. I do not mean to say that it is not possible that secondary enrichment may have taken place and made the surface deposits somewhat richer than the ore bodies at greater depth; but I do hold that it is unreasonable to suppose that the ore values will be lowered to such an extent as to make profitable mining impossible.

In a contribution to the Mining Society of Nova Scotia (March meeting, 1907), the writer has endeavored to explain how the continuation of an ore body may be lost and the mine abandoned, but reopened later, the ore body found and followed to a considerable depth.

The old Nova Scotian method was so peculiarly adapted to losing a pay shoot that it is a wonder any mine passed the initial stages. As a matter of fact, the existence of pay shoots has been in the past and is even today to a great extent ignored.

The following is a brief sketch of what has been the history characteristic of many of the most promising mines of Nova Scotia.

The rich outcrop of an ore body has been opened up and near the surface, and in some cases to a considerable depth, has given very satisfactory returns. The owners, probably working it themselves, and for the good of their own pockets, have endeavored to handle only such ore as would pay them to mine.

Doubtless the method of mining has been most crude

and their eyes the chief guide as to the location of pay ore. Sooner or later the water has become troublesome, and the cost of sinking new shafts and their inability to follow the pay ore as depth increased has forced them to sell to a company with larger capital. The new company at once condemned the methods and machinery of their predecessors and completely changed the scheme of development. Perhaps they sank a vertical shaft to cut underlying ore bodies and established an elaborate system of cross-cuts and levels. The mill was quadrupled in capacity and operations started on what was termed in the prospectus "a modern scale." What was the result? The "pay streak," probably small in comparison with the outlined scheme for future development, was completely lost sight of. It had been sufficient to yield the original owners a handsome profit on their work, but not worth considering, presumable, by a company with a million dollar capital.

The new company had large quantities of so-called "ore" in sight, forgetting that vein matter though it may be quartz is not necessarily "ore," and proceeded to mill it with most unsatisfactory returns. After a few months' work the mine is condemned and the gold measures of Nova Scotia get the blame once more; whereas if, instead of a 40 or 60 stamp mill, this company, content with a modest capital, had erected at first a modern ten stamp mill, they could have developed intelligently the "pay streak" of the former owners. If water powers were available, these could have been utilized, thus eliminating the bugbear of high-priced coal.

The mine thus equipped could be developed at a profit and actual "ore" blocked out until such time as an increase in milling capacity was warranted.

Mr. E. R. Faribault, of the Geological Survey of Canada, in his most excellent paper "The Gold Measures of Nova Scotia and Deep Mining," published by the Mining Society of Nova Scotia, deals mostly with one class of the gold-bearing veins of the Province. In his remarks regarding pay streaks he says: "In the interstratified veins the gold is sometimes distributed uniformly over considerable areas; usually, however, it is more or less concentrated within certain limits, leaving spaces on each side comparatively barren. These enrichments are known as pay streaks, and have hitherto been the chief source of the gold production." I think that it might be more truly said that the outcrops of these pay streaks have hitherto been the chief source of the gold production.

Mr. Faribault further says: "The pay streaks lie at right angles to the sliding movement, that is to say, approximately parallel to the anticlinal axis." I may add that the accuracy of this statement is being demonstrated more clearly every day by the work now being done by the Boston Richardson Mining Company.

For further data regarding pay streaks the reader is referred to Mr. Faribault's valuable paper.

The direction of pay streaks on the veins cutting the stratification is not so readily determined. In the case of the Libbey mine at North Brookfield, the ore shoot followed the intersection of the "fissure" with a main or interstratified vein. In other districts the pay streaks in the veins cutting the bedding appear to be governed by the nature of the strata crossed. Yet again, in other localities the occurrence of small "feeder" veins or "angulars" appears to be the cause of the enrichment.

It is most apparent that the subject should be carefully studied and accurate records kept of all data that may help to solve the problem.

As Mr. Faribault says again: "The data necessary to explain the many peculiarities in the different gold districts are difficult to obtain with any degree of precision, as few plans or records have been kept or are obtainable."

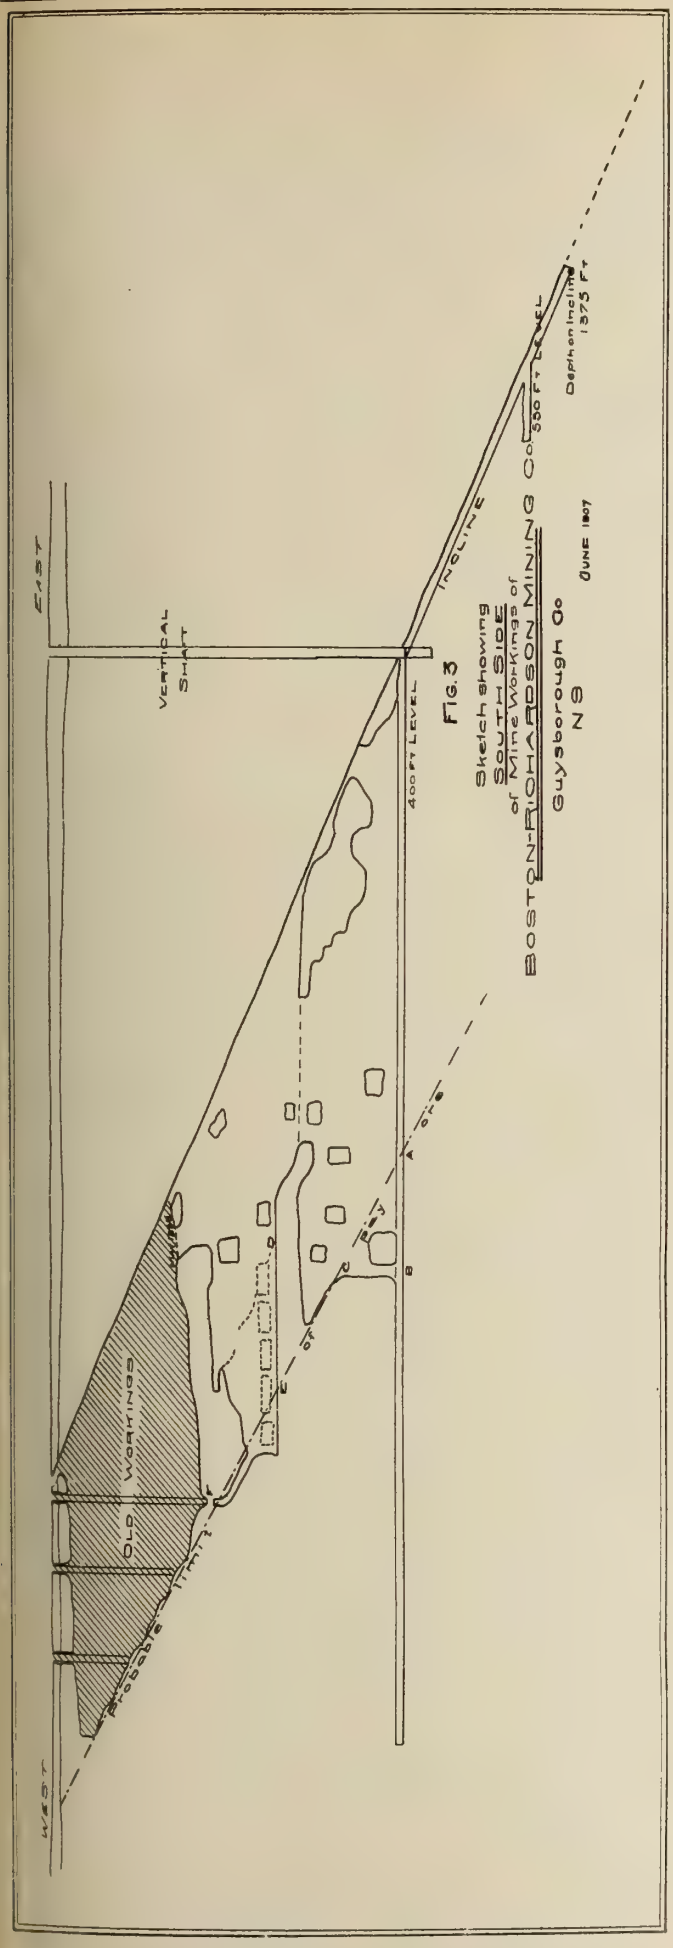
In a few cases in this Province such shoots or pay streaks have been successfully followed to considerable depths, in one case to a depth of over 2,000 feet along an incline of 35 degrees to the horizontal, or a vertical depth of 1,000 feet. In another case by means of a vertical shaft, levels and winzes to a vertical depth of one thousand feet. In these cases it was not because the ore body was any more promising or persistent than many that have been abandoned; but it was because the management possessed the necessary experience, pluck and perseverance that the mine was kept upon its feet.

Th accompanying sketches, Figures 1, 2 and 3, will illustrate how some Nova Scotian mines have been developed from the old method of working, which has been discussed previously, to a modern method of overhand stoping.

Figure 1 shows the underground workings of the mine of the Brookfield Mining Company (Libbey Mine), the development of which is described in detail in the paper previously mentioned.

This affords one of the best examples we possess of the abandonment of a mine after the rich outcrop of the pay streak has been removed. It affords also an excellent example of the manner in which such an ore shoot can be successfully followed to a considerable depth. Figure 2 shows the workings of the Mic-Mac mine, and the radical change which its system of development has undergone during the past eight years. The survey of the old workings, made by the writer in 1899, shows how the stopes had been beaten down flat. All ore was passed to the shafts by shovellers and then shovelled into small tubs to be raised to the surface.

The present workings (taken from a plan published by *The Industrial Advocate,* May, 1906) shows a system of "backstoping." Cars are used on the levels, large bins at the shaft and a self-dumping skip carries the ore to the surface.



This mine is peculiar in that I understand the management claim that there is no definite "ore" shoot.

Figure 3 shows the south side of the Richardson fold and demonstrates clearly how well defined is the line of pay ore. The ore body on the north side is much larger than that on the south, and though the lines of the pay ore are well demonstrated there it does not illustrate the point so clearly as the workings shown in the figure.

The old workings were opened up in the regular way, the usual number of shafts were sunk and bottomed in the lower edge of the pay shoot, as shown. By the time this work was completed it was considered that the mine was practically done; but the Boston, Richardson Company took hold of the proposition, sank the vertical shaft as shown, struck the continuation of the dome at 400 feet, and worked westward along the legs of the belt. The south level was pushed forward until at a point, marked A on the sketch, the ore values pinched out. The level was continued westward for some distance, but the values continued low. A raise was driven upward from the point B, which entered the ore body at C and was continued along it on an incline.

Again work was started at a point, D, just below the old workings, and followed westward to E, when the values again became low. A raise was put up just beyond this point, cutting the pay shoot again, as shown. An inclined raise was then driven to tap the old works at F.

I consider that this shows, in a remarkable way, the continuity of a line of pay ore. The ore body on the

400 foot level gives every indication of being better in value than at points nearer the surface.

The Boston, Richardson Company are now developing the ore body on both sides of the apex by sinking an inclined shaft on the pitch of the dome or apex, as shown. They thus avoid the mistake of sinking through and past their ore body with a vertical shaft. As to whether the value of the ore decreases with depth can be judged from the history of the mines shown in the accompany sketches.

I am told that for the past two years the average yield per ton from the Mic-Mac Mine has been over $10 per ton, which is quite up to the average of the mine and better than the value of the ore at many places nearer the surface.

The last brick of gold from the mine of the Brookfield Mining Company was over 500 ounces, which was one of the largest in its history.

The ore of the Boston, Richardson gives every indication of becoming better with depth, and I believe that the future work of this company will give the best illustration of this point that has ever been shown in the Province of Nova Scotia.

I hold that the general disregard of pay streaks, either through losing the continuation of the same or smothering the good ore obtained from such pay streaks with thousands of tons of worthless quartz has resulted in the present idleness of so many of our mines.

It has unfortunately been the case that when a large company has started operations in the Province they have hardly ever been content to develop the mine so as to work the pay ore only. The demand has always been for tonnage. Careful sampling of the mine has been neglected, and ore from every portion of it has been put in together, so that finally, where there might have been a yield of $5 per ton with a 20 stamp mill, and a good profit, the yield has been cut down to perhaps $1 or $1.50 per ton in a 60 stamp mill and the margin of profit emilinated.

It is more difficult than it might seem to right this state of affairs. As a rule no accurate maps or other data can be obtained of the abandoned mines, so that if a man wishes to open one of them he has to go to considerable expense before knowing how to start.

But this is not all. He must first get the property, and here the chief difficulty confronts him. The company holding the mine may not, and probable do not, consider the property of any real value; but when a purchaser appears they remember what it has cost them (through their own mistakes) in the past, and hope to get their money back by selling at a high figure. The consequence is that the would-be purchaser is rightly discouraged. He sees that even if the mine should pan out as he believes probable, there would be no money in it for him. There is nothing to prevent such companies holding these mines as long as they wish to, for under the present law they have only to pay 50 cents per year for each area they wish to hold and the property remains theirs.

The attitude of such non-operators is well illustrated by the following true story:

A certain American capitalist having decided to purchase a gold mining property not a thousand miles from Isaacs Harbor, was being driven to the camp by a local man. The conversation turned to mining, and the driver confessed to being a part owner of the very property his passenger was going to visit. Without revealing his identity, the gentleman asked the driver the reason why, if his property was as good as he described it, they did

not work it themselves, whereupon the driver turned to him with a smile, the embodiment of business cunning, and said: "We are waiting for some sucker to come along."

It appears to the writer that in order to relieve the present stagnation of the mining industry a radical change must be made in the laws governing the holding of mining property. If a man has not faith enough in his property, or even if he has the faith, but cannot get the capital to demonstrate it, let some one have the property who has faith and can command the capital necessary to prove it.

The Government of this Province has shown itself willing to aid the mining industry in many ways. Let it now come forward and so help gold mining that it may be put upon a secure and permanent basis.

Some New Points in the Geology of Copper Ores

By James F. Kemp, DSc., etc., Columbia University, New York.

(Toronto Meeting, 1907.)

During the past year or two cobalt and silver have been the metals most prominently in the foreground in Ontario; but south of the national boundary and in other parts of the world, copper has occupied the centre of the stage. The growth of electrical applications and the increasing consumption of brass have made the market well-nigh insatiable. Copper mining has greatly increased, and with the growth of new districts and with widening experience, we have found it necessary to modify some of our old-time conceptions.

Twenty-five years ago, when the classes in the mining schools were taught the mineralogy of the ores of copper, it was chalcopyrite that was esteemed the principal mineral. Of course the importance of the native metal on Keweenaw point was appreciated, but we used to define an ore as "the compound of a metal and mineralizer, such as sulphur or oxygen"—and the native form, even though abundant in one locality, was thus ruled out. Experience with the lenticular beds or veins, in the slates and schists along the Appalachian belt from Sherbrooke, Quebec, to Ducktown, Tennessee, and the historic ore bodies of the Rio Tinto district in Spain, whose geological relations are similar, gave good ground for the esteem in which chalcopyrite was held. It was considered, moreover, to be the original mineral from which the others were generally believed to have been derived. Observers of those days were perfectly familiar with the oxidized zone, and with the zone of enrichment, at the level of the ground-water. At the latter horizon the Ducktown mines had taught all of us in America that rich black ores were precipitated, but the dark mineral was for many years believed to be the oxide, tenorite or melaconite, until W. H. Weed proved it to be chalcocite. Chalcocite was esteemed to be rather uncommon, and when we students saw it at all, it was chiefly in crystals from the old copper mine at Bristol, Connecticut, an enterprise that had impressed its shareholders rather by the lack of copper than by its abundance.

To-day, on the contrary, in the United States and Mexico, chalcocite furnishes much the largest part of the copper produced, and for some years to come its relative importance bids fair to increase rather than diminish. Butte, Morenci, Bisbee, Globe, and Cananea derive most of their output from it, while Bingham and Ely will soon be concentrating the glance from the porphyries on an enormous scale.

So far is chalcopyrite from being the principal and original mineral at Butte, that on the one hand it is rather uncommon and on the other it is one of the latest of the secondary minerals, since we find it in veinlets cutting covellite. Alike at Butte and in Arizona the original mineral appears to be a lean copper-bearing iron pyrite, which is then, by secondary enrichment, oxidized in one place and deprived of its copper, only to gain the latter elsewhere in the form of chalcocite, which brings the lean original up to grade.

In later years, and for a period lasting well up to the present, we have laid great and just emphasis on the processes of secondary enrichment by the descending surface waters. We believed that the new chalcocite and other minerals were deposited at the level of the ground-water and for a limited distance below it. That is, we gradually grew to recognize the necessity of a greater diffusion of the descending copper solution throughout the quiet ground-water than we had at first thought either necessary or probable. But in the issue of the *Mining and Scientific Press* for February 23rd, page 236, we learned that a cross-cut in the Berlin claim at Butte had cut a great body of glance, at 1,800 feet from the surface, and that in the Neversweat, at 2,400 feet, a similar occurrence had been noted. Even before this it was generally reported that a cross-cut from the shaft at 2,000 feet in the Speculator claim had intercepted these rich ores in a still different lode.

Various suggestions tending to reorganize our old views either have been made or may be made in consequence of these discoveries. The hillside on which the copper mines are situated at Butte rises gradually to the north from the valley of Silver Bow Creek, or more steeply to the west from the same creek at Meaderville. In the latter area, shafts are said to have found the bedrock under 600 feet of overlying loose material. Obviously, as the valley was excavated by erosion, and as the former representative of Silver Bow Creek established the low point of the ground-water upon its bed rock, the subterranean water level must have risen from this point, in the hill, roughly following the surface, but at a flatter slope. The present outcrops of the copper veins are from 500 to 700 feet above the present valley, or from 1,100 to 1,300 feet above the bed rock. To estimate the ancient level of the ground-water, we must diminish 1,100 to 1,300 by such figures as will allow for its rise, roughly parallel with the surface. Whatever assumptions we may make, horeover, regarding wall rock and vein matter removed by erosion, will operate to further raise the ground-water level. It certainly can scarcely have been lower than 800 to 1,000 feet below the collars of the present shafts. The recently discovered bonanzas are from 1,000 to 1,500 feet below this level, and according to our old ideas of the diffusion of the descending copper-bearing solutions, they must have

penetrated at least 1,000 to 1,500 feet of standing water. This seems unlikely.

On the other hand we may raise the question, could the ground-water have been so irregular in its distribution that no standing body of it intervened to stagnate the descending water? This seems unlikely. Again, is chalcocite necessarily a secondary mineral? May it not be of original deposition? Experience thus far leads us to think that the presumption of its secondary nature is well grounded.

Most reasonable of all would appear to be W. H. Weed's suggestion of secondary enrichment by uprising solutions of copper, set in action perhaps by the late rhyolite. From these no lean pyrite of primary deposition thus far observed would be too deep to escape, although solutions of oxidized copper salts, such as bring about enrichment by descending surface waters, are not what we associate with waters uprising from the depths. Mr. Weed applies his conclusions especially to the enargite at Butte, but as the glance is being found deeper and deeper, we may at least raise the question whether its lower deposits may not also have been introduced from the depths.

Ten years ago, or even less, great apprehension was felt about the persistence of ore in depth. The newly appreciated doctrines of secondary enrichment from above had emphasized and increased the misgivings, and much experience corroborated them. Rio Tinto was most often cited, where, in the San Domingo vein or lense, 4 to 5 per cent. of copper had been obtained at the surface; 2 per cent. at 260 feet; 1 1-2 to 1 1-4 per cent. at 425 feet. In the Dionisio, there was 4 per cent. at the surface; 2 per cent. at 650, and 2 1-2 per cent. at 1,500 feet. In the last citation there was a ray of comfort, but the general result was decidedly discouraging. At Butte, too, the general yield of the ores has gone down. A few years ago it was 5 to 6 per cent; now it is 3 to 4 per cent. In Arizona, 15 to 20 per cent. was not uncommon twenty years ago. The ores run 6 to 7 per cent. now, and the glance in the porphyries 3 per cent. as it goes to the mill. Improved transportation and milling processes are responsible for bringing lower and lower ores within the range of profit, and, as we must realize, there is the tendency steadily to reduce the general average; but if, at Butte, 40 per cent. ore occurs in great stopes at 1,800 feet, and 60 per cent. ore at 2,400 feet, we may raise the question as to whether the old-time generalization is as sweeping as we formerly thought.

Reverting again to the time-honored conceptions of the lenticular ore bodies or *Kieslager* of the slate and schist of the Appalachian belt and of Rio Tinto, many of us will recall that these were esteemed our typical deposits. But in later years developments in the Southwestern States, in Mexico, and in Queensland, have proved the frequent occurrence and great importance of garnet zones produced by contact metamorphism in limestone along intrusive rocks. Bisbee and Morenci, in Arizona; San Pedro, New Mexico; Aranzazu and San Jose, Mexico; Chillagoe, Queensland; and many more have shown the importance and wide distribution of this type. Garnet, vesuvianite, wollastonite, and diopside, are the associated minerals, and the ore bodies are of irregular shape. They often need secondary enrichment to bring them up to grade. They are not lenses, as are the ores at Thedford and Rio Tinto; nor veins, as at Butte; nor beds as at Mansfeld; nor impregnations of shattered rock, as at Nacosari; but are a new type when compared with our old conceptions.

One of our tendencies in earlier years was to connect ore bodies, especially of copper, with basic eruptives. Keeweenaw Point and Sudbury gave good support to these inferences. It was also natural to infer that as iron and the other bases increased in rocks, therefore copper, lead, and other metals would do the same in less degree. But recent experiences is just the opposite in the case of copper. Globe, Arizona, with its diabase, and the Nikolai and other greenstones of the northwest coast are almost the only basic ones that appear in the newer districts. On the contrary, we find quartz-bearing rocks of various kinds and more especially fairly acidic variety midway between syenite and diorite, called monzonite. Bingham, Ely, Bisbee, Morenci, Nacosari, and the granite at Butte, all afford a similar experience. The great deposits of Northern California are in rhyolite porphyries. We cannot but reflect that the acidic magmas are richest in dissolved vapors, that they probably in cooling yield relatively abundant magmatic waters; and that, being at the outset copper-bearing, the ore bodies are perhaps due to these characteristics.

But the most striking feature of the last year or two is the tendency of mines first worked for other metals to yield copper in depth. From Butte we learn that the silver mines along the Rainbow lode, in which, in the upper workings, no copper was found, are now showing as much as 3 per cent. at 1,000 feet. The old Black Rock claim, once a silver mine and a participant in the famous Black Rock-Niagara apex suit, is being revived and deepened for copper; and others are actually yielding the red metal. The Cable gold mines, farther west in Montana, now supply 3 per cent. ore to the Washoe smelter. Bingham, once a lead-silver camp, has changed to copper. From Leadville the same report has been coming for some years, that much copper was found with the unchanged sulphides in depth. At Red Mountain, where, near the surface, lead-silver was formerly the yield of the ore, now, in the 1,100 foot adit into the mountain, copper has been found. In North Carolina, some gold mines of former years have become copper mines to-day. Most striking of all, at the great Mt. Morgan gold mine of Queensland, the diamond drill, at 725 feet, has shown great bodies of copper-bearing sulphides, which now go to the furnace, as the earlier gold ores went to the mill.

We have for years known that lead above often passed into zinc below. We may perhaps now add a still deeper copper zone, when, in the uprising water that brought in the ore, copper was present with the other two. Gold above may also change to copper below, or be associated with it, and apparently not always because copper once general throughout the vein has passed downward with the atmospheric waters.

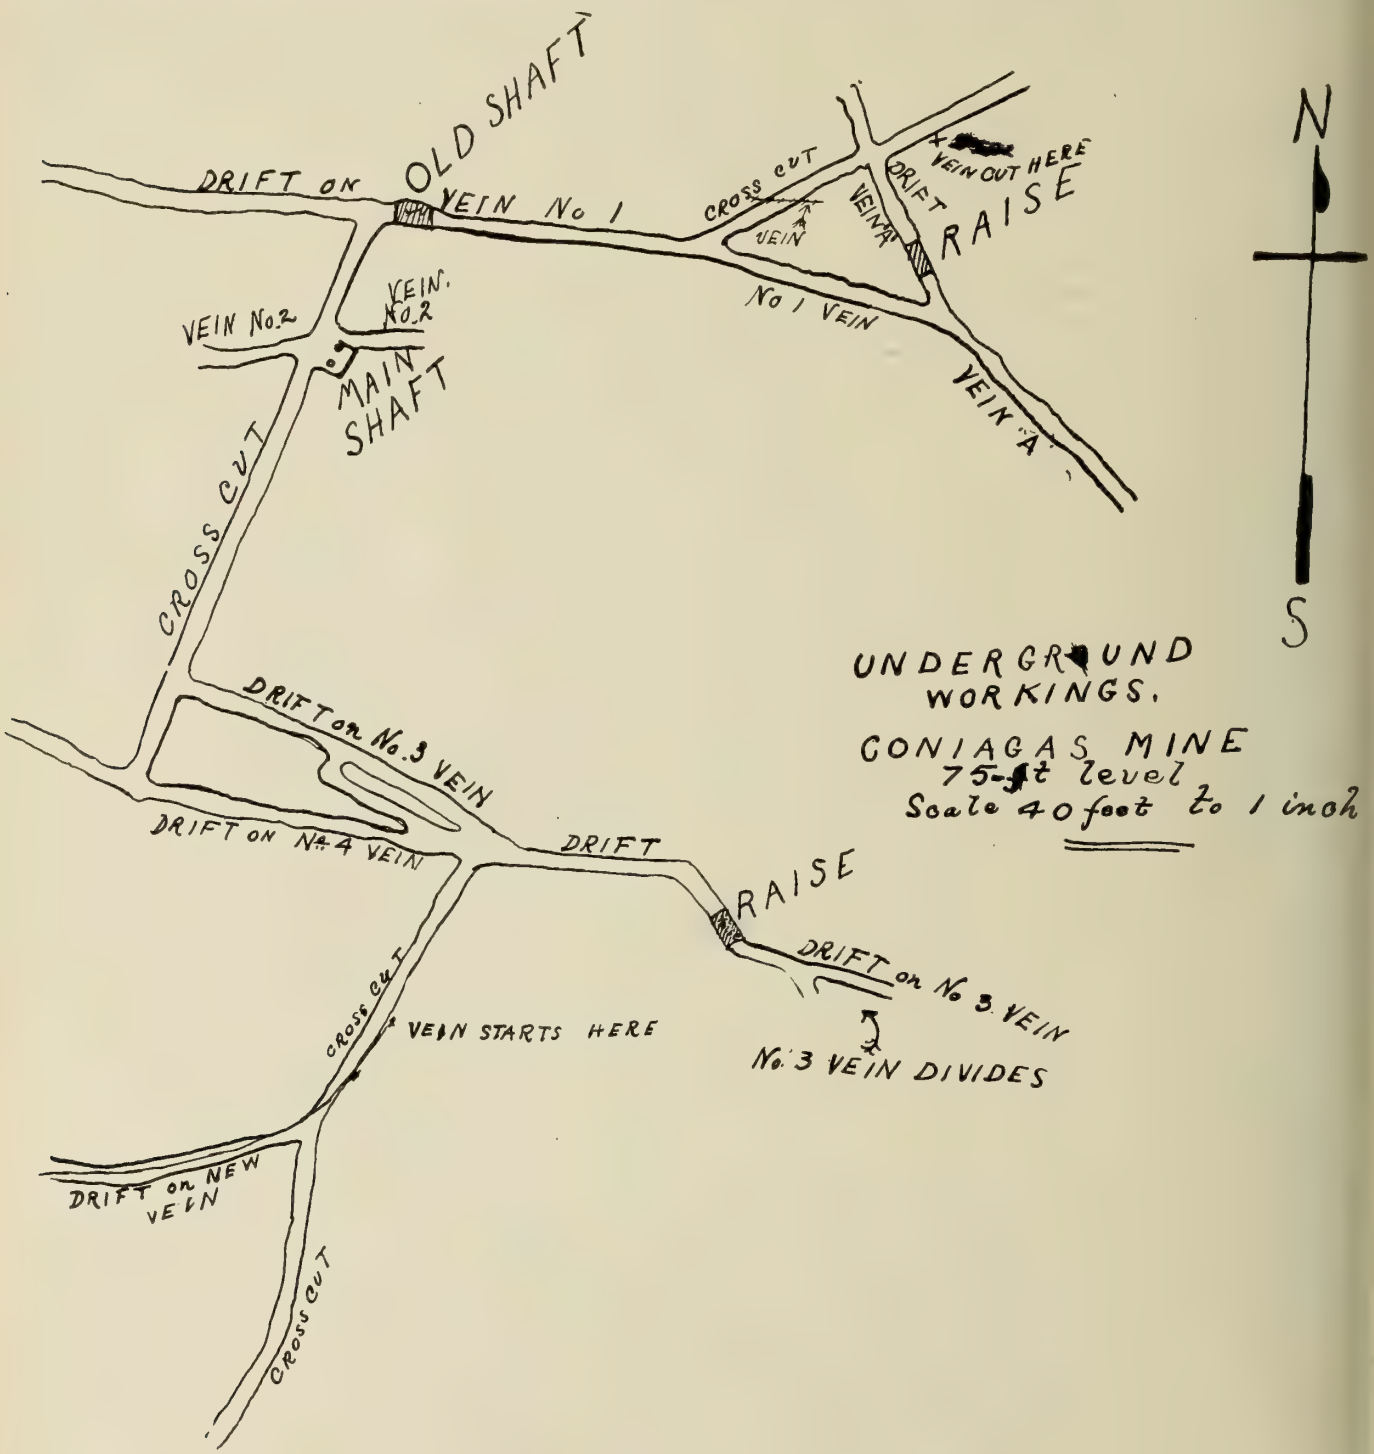
An interesting corroboration is thus afforded of views advanced by W. H. Weed in the paper already cited, of which one of the closing paragraphs is: "Ascending hot-spring waters, if metalliferous, may deposit different ores with an orderly vertical distribution. Existing veins now mined often show this arrangement of metallic sulphides."*

* Trans. Amer. Int. Min. Eng. Vol. XXXIII. p. 754, 1903.

The Department of Mines' new monograph on Canadian graphite, written and compiled by Mr. Fritz Cirkel, M.E., will be issued very shortly. We are informed that the work is of a very comprehensive nature and will form a most useful addition to the series on Canadian minerals, now being published under the auspices of the Department.

THE CONIAGAS MINE AND CONCENTRATOR

Through the courtesy of the officials of the Coniagas Mines, Limited, we are enabled to publish a plan of the underground workings and a flow-sheet showing the proposed treatment of their concentrating ore. The flow-sheet is of especial interest, as Cobalt's future will depend in a large degree upon concentrating ores. For the sake of comparison it may not be out of place to note roughly the equipment chosen for the Buffalo concentrator:—



Three Blake crushers, one of which is 6 inch x 20 inch, and the other two 7 inch x 9 inch.

Two rolls, 15 inch x 20 inch, with 8 to 12 tons capacity per hour.

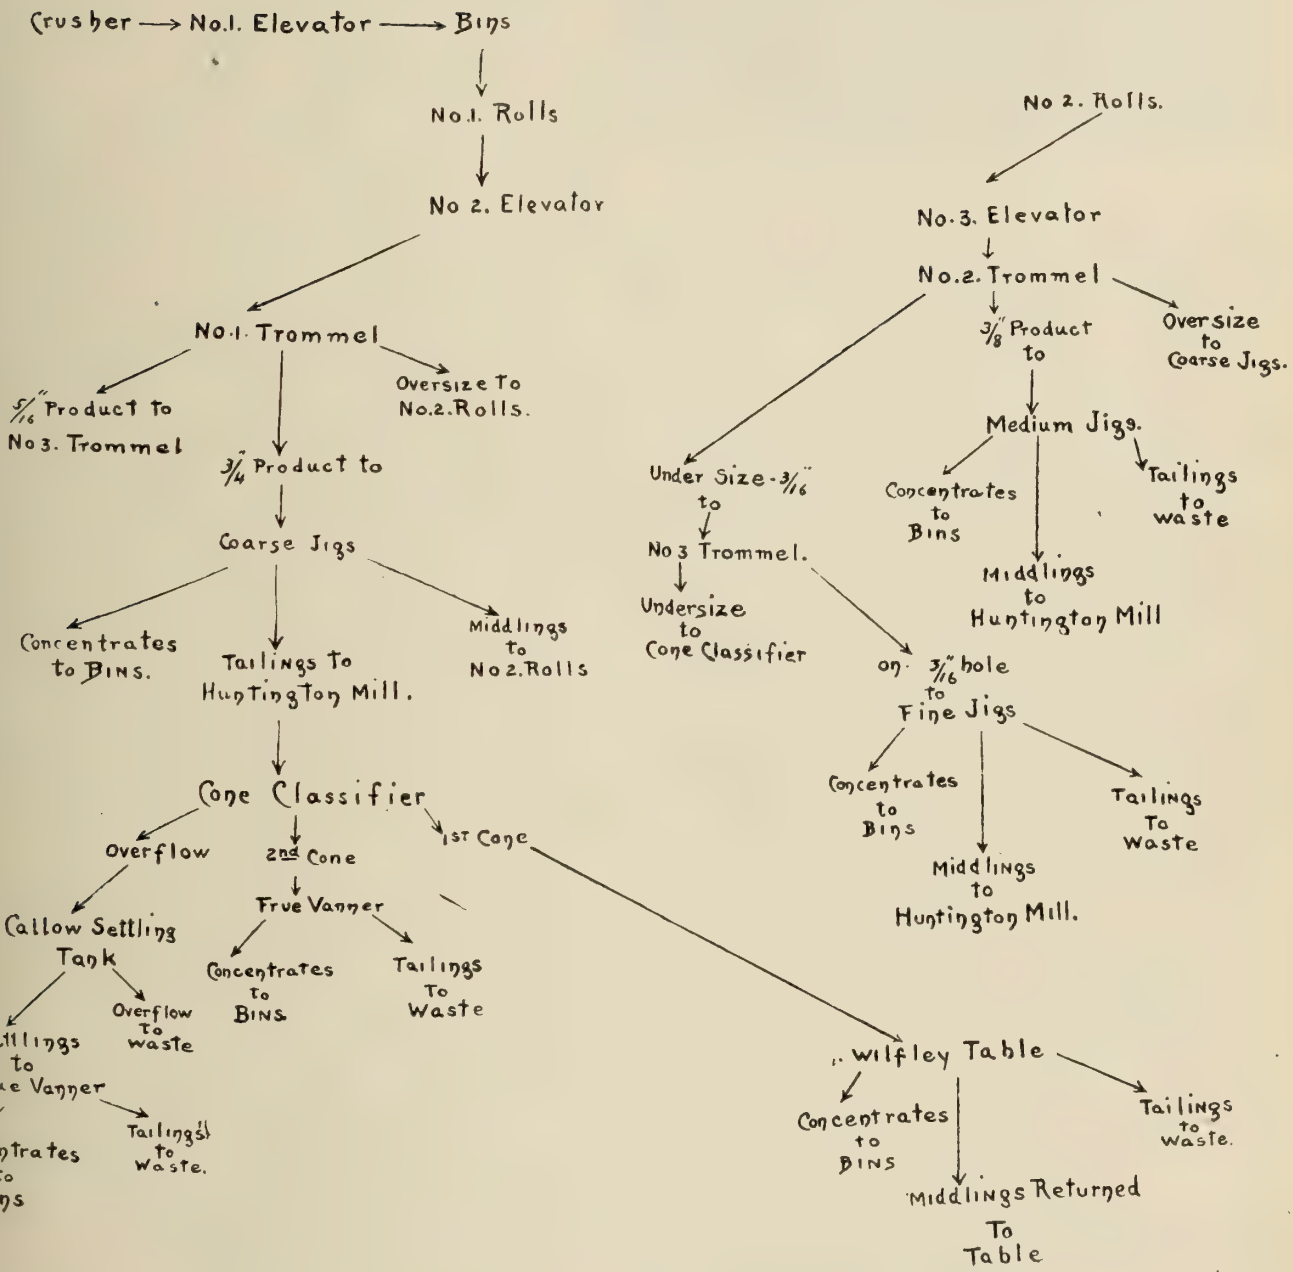
Two double trommels.

Two hydraulic clasisfiers.

Two jigs, one or two compartments and one of threee.

PLAN OF CONIAGAS MINE, COBALT, ONT.

One Huntingdon mill.



Settling tank.

Wilfley concentrating tables and Frue Vanner.

Slime tanks.

Belt elevators.

Proposed Flow Sheet.
for
The Coniagas Concentrator.

CONCENTRATOR BUILDING, CONIAGAS MINE, COBALT, ONT.

GEOLOGICAL SURVEY OF NEWFOUNDLAND

REPORT UPON THE MINERAL STATISTICS OF THE ISLAND FOR THE CALENDAR YEAR 1906

The total value of the mineral production of Newfoundland during 1906 is set at $1,462,344, an increase over 1905 of $95,051. The number of persons employed in mining during the year was 2,271. Only three fatalities occurred during 1906, a death rate per thousand of 1.31.

The following summary gives details of the mineral production:

MINERAL PRODUCTION OF NEWFOUNDLAND FOR 1906.

Antmony—Quantity raised, 100 tons; value of mineral exported, $4,050; total value of production, $4,050.

Brick—Quantity raised, 906,000 thousand; manufactured or used in Island, 906,000 thousand; total value of production, $8,260.

Building Stone—Quantity raised, 500 tons; manufactured or used in Island, 500 tons; total value of production, $750.

Cobble and Spawls—Quantity raised, 1,000 tons; manufactured or used in Island, 1,000 tons; total value of production, $1,000.

Crushed Stone—Quantity raised, 5,000 tons; manufactured or used in Island, 5,000 tons; total value of production, $5,000.

Copper Ore—Quantity raised, 75,989 tons; value of mineral exported, $360,345; total value of production, $360,345.

Gold Ore—Quantity raised, 900 tons; manufactured or used in Island, 147 ounces; value of mineral exported, $2,800; total value of production, $2,800.

Iron Ore—Quantity raised, 884,986 tons; value of mineral exported, $959,765; total value of production, $966,625.

Limestone—Quantity raised, 1,200 tons, manufactured or used in Island, 12,600 bushels; total value of production, $1,200.

Pyrite—Quantity raised, 28,132 tons; value of mineral exported, $84,396; total value of production, $84,396.

Sand and Gravel—Quantity raised, 1,000 tons; manufactured or used in Island, 1,000 bushels; total value of production, $2,500.

Slate—Quantity raised, 2,536 tons; manufactured or used in Island, 64 1-2 bushels; total value of production, $25,418.

Total value of minerals exported, $1,436,129; total value of production, $1,462,344.

Note.—Tons of 2,240 pounds.

Copper.—Exports of copper ore show a decrease of 2,731 tons, but the rise in price of metallic copper brought up the total value of the output to a figure $1,565 in excess of 1905. The Tilt Cove Mine, with an output of 66,189 tons, is the principal producer of copper ore. Prospecting for copper ore is reported to be active. Analyses of a deposit at Goose Cove, Hare Bay, gave 6.77 per cent. copper, $2.48 in gold and 57 cents in silver per ton. The Guggenheim Exploration Company has taken an option on the native copper property at Oderin Island, Placentia Bay. A New York syndicate has bonded St. Julien copper mine. The report speaks very cheerfully of the prospects of rapid development of Newfoundland's copper ore deposits.

Gold.—In May, 1906, a ten-stamp mill and a Wilfley concentrator were installed at Goldenville, near Ming's. In four months' run, at one shift per day, the mine produced gold bullion to the value of $1,500, and concentrates to a similar amount. A cyanide plant is badly needed. The deposit is of the bedded type and is composed of megnetic slate, quartz and pyrite. The lode has been traced for a mile on the company's property. It varies in width from 5 to 13 feet. A sample shipment of 23 tons was sent to the Brookfield mill in Nova Scotia. This yielded $192.72, a recovery of $8.38 per ton. Five tons of slimes carrying a total value of $55 could not be saved. Levels are now being driven east and west on the lode at a depth of 80 feet below the surface. During the sinking of the shaft frequent assays were made. At 50 to 69 feet the quartz assayed $12.60 to the ton; pyrite, concentrated from this sample, gave $50.80 to the ton. The slate mined with the quartz carries about $1.50 in gold. The values in the quartz appear to decrease in the levels. This is the first gold mine actually operated in Newfoundland.

Iron Ore.—The Bell Island mines produced more iron ore during 1906 than in any previous year. The value of the ore has advanced 10 cents per ton. Mining is now actively prosecuted during the winter. The Nova Scotia Company are driving a submarine tunnel beneath the bay, on the north side of the island to reach their ore deposits a mile from the shore. No serious difficulty has been caused by water. An English company has secured an option on the deposits of ore on the west end of Bell Island, and it is probable that they will open workings during 1907. The hematite deposits on the north side of Conception Bay are again attracting attention.

Lead Ores.—It is reported that the Messrs. Harmsworth have some miners employed at Red Indian Lake opening up a galena deposit.

Pyrite.—During 1906 the pyrite mine at Pilley's Island produced hardly more than one-half of the previous year's output. Mining charges and all costs amount to about $1.50 per ton, leaving a profit of about $4.50.

Petroleum.—The Newfoundland Petroleum Company, Limited, drilled about 3,000 feet at Parson's Pond. The

first hole was a failure. The second hole gave small quantities of oil at 1,600 feet. Drilling was suspended, owing to an accident. The official report speaks very favorably of this oil field and urges the investment of more capital.

Talc.—No talc was mined during 1906. No reason is assigned for the suspension of this industry. "Possibly the absence of sufficient capital and enterprise is what is lacking."

Platinum.—Platinum, it is stated, has been discovered in chromite near Mount Cormack. It is not in quantity sufficient to repay extraction.

Coal-boring Operations.—Boring for coal was carried on during the summer of 1906 near Goose Brook. No results of a definite character were obtained.

BOOK REVIEWS

"The Subject Matter Index of Mining, Mechanical and Metallurgical Literature for the Year 1901." Published by the North of England Institute of Mining and Mechanical Engineers. Edited by the secretary, M. Walton Brown. Newcastle-upon-Tyne. Price 42s. This admirably complete work of reference comprises a list of well-nigh 1,000 technical periodicals and other publications. The "Subject Matter" index classifies their contents for the year 1901. An index of authors is also given.

"The Journal of the Mining Society of Nova Scotia, Vol. X, being the Transactions of the Society during the year 1905-6. Edited by H. Piers. This volume presents an account of the annual and semi-annual meetings. The discussions of various matters pertaining to the coal, iron and gold industries are decidedly instructive. A series of seven papers on technical subjects follows. Among these papers is a somewhat remarkable one by W. C. Milner, entitled "Reciprocity in Coal." While it is tinged with partisan feeling, it is, nevertheless, deserving of perusal. The other papers are all of an exceedingly high order. T. T. Fulton's research report on "The Lixiviation of an Auriferous Arsenopyrite Concentrate by Cyanide" shows careful preparation and systematic work.

"Mine Timbering," by Wilton E. Sanders, Norman W. Parlee, Bernard MacDonald, and others; New York and London; Hill Publishing Company; pp. 180, illustrated. Price $2.

No branch of mining has received so small an amount of attention as mine timbering. And, perhaps, there is no subject upon which competent men hold such diametrically opposite ideas. *The Engineering and Mining Journal* has issued a book dealing with this important subject. The book is a compilation of articles that have appeared from time to time in the pages of the *Journal.* It is a valuable symposium of the practice of eminent engineers in the United States, Canada, Queensland and Tasmania. As the first serious attempt to present the whole subject of mine timbering in convenient book form, this volume deserves attention. Its value is enhanced by the consideration that in the principal mining districts of Canada the wasteful methods hitherto in vogue have made serious inroads upon the available resources. The book is the more valuable in that it gives a comparison of many different methods.

EXCHANGES

The West Australian Mining, Building and Engineering Journal for May 18th has been received.

In the *Transactions* of the Mining Institute of Scotland, at their annual general meeting at Hamilton, on April 11th, 1907, are papers on "A Stretcher for Use in Mines" and on "The Hanley Cape Guardian."

A surprising amount of useful information is to be found in the June number of *Technical Literature.* Besides the digest of current information on engineering and general science, several special articles appear, the most prominent being a description of Lehigh University.

In *The Mining Reporter,* June 20th, Otto Ruhl writes on the "Origin of Lead and Zinc Ore Bodies in Joplin, Missouri, District." The following excerpt is interesting: "An interesting feature of the process of ore deposition is found in constant reconcentration and enrichment below the level of ground water. As the degradation of the upper strata goes on, the waters in their downward course redissolve the minerals and carry them downward, re-depositing at lower levels."

In *The Mining Reporter,* June 27th, Arthur Lakes writes of the "Origin of Copper Impregnations in Sedimentary Rocks." Mr. Lakes concludes his paper with the following significant query: "Can it be possible that certain seas or other large bodies of water could locally be so charged with copper solutions, derived from some unknown sulphide source, as to be capable of being precipitated by organic or other agencies to such an extent as subsequently to form beds of workable copper ore?"

The Colliery Guardian, June 21st, in the course of its editorial comments upon the first report of the Royal Commission on Mines, notes that rescue appliances of the "pneumatogen" type develope a weakness in use. In these appliances oxygen is produced chemically by the action of carbonic acid upon alkaline peroxides. Owing to the choking of the regenerating cartridges there is a marked tendency to break down. This type, however, has the advantage of light weight. The compressed oxygen type, of which the Drager, Shamrock, Fleuss and Weg apparatus are the best known, give better results so far as the supply of oxygen is concerned. But their heavy weight is a drawback.

PERSONAL AND GENERAL

Mr. Cyril Knight, of the Ontario Geological Department, is in Toronto.

Mr. T. Hayes-Sheen was recently in Toronto on business connected with Bruce Mines.

Dr. Willett G. Miller, Provincial Geologist, has returned to Toronto from Cobalt district.

The autumn meeting of the Iron and Steel Institute will be held in Vienna on September 23rd, 24th and 25th.

Mr. O. N. Scott has returned to Toronto from a visit to the Lake of the Woods and Wabigoon districts. Mr. Scott will shortly leave again for the West.

The Hon. Mr. Cochrane, accompanied by Messrs. Monteith and Reaume, visited the various towns of the Nipissing district during the week beginning June 24th.

Mr. J. A. Bancroft, Assistant Professor of Geology at McGill University, has been retained for the summer by the Geological Survey of Canada to continue

the reconnaissance work commenced by Mr. O. E. Le Roy last year in the area along the British Pacific mainland coast.

Mr. T. W. Stiles, consulting engineer for the Canadian Mines Syndicate, Ottawa, has returned from an expedition north of Blind River. Mr. Stiles examined some copper properties in that district.

Mr. T. L. Gallagher, of the Hamilton Powder Company, who has been ill for some time, has left for the seaside. THE JOURNAL is glad to hear that Mr. Gallagher is on the high road to health and strength.

The resignation of Dr. G. C. Hoffman as assistant director, chemist and mineralogist of the Geological Survey of Canada, is announced. Dr. Hoffman has been a member of the staff of the Survey for thirty-five years.

Mr. J. W. Campbell has resigned the position of the Canadian General Electric Company's manager of contract sales to accept the managing directorship of the Alberta Portland Cement Company, Edmonton, Alberta.

THE CANADIAN MINING JOURNAL extends congratulations to Mr. Frederick Hobart, associate editor of *The Engineering and Mining Journal* of New York, on the occasion of his marriage to Miss Charlotte A. Clarke, of Brooklyn. The ceremony was performed on the 12th inst.

Mr. H. H. Claudet, the Elmore Company's representative at Rossland, has been recently engaged in installing new vacuum oil concentration plants at mines in Mexico and Colorado. Two similar plants, however, have been ordered for Canadian mines, and one will shortly be installed on a property in the Kootenay, and a second at an Ontario mine.

The season's work at the Bullion mine, formerly owned by the Consolidateed Cariboo Hydraulic Mining Company, is now well under way, Mr. J. B. Hobson, the manager, having gone up to Quesnel from Victoria to direct operations. These properties, it will be remembered, were acquired a year or so ago, after being reported on favorably by Mr. John Hays Hammond, to the Guggenheim syndicate.

Thus *The Montreal Gazette* in a recent editorial paragraph: "The Western Federation of Miners has adopted a new constitution, which pledges all members to follow the teachings of political socialism. The federation is becoming conservative. Heretofore its militant members have been noted as following the teachings of anarchism." Which remark is wholly worthy of the *Gazette*, being, if guiltless of poetry, at least strictly accurate.

British Columbia still maintains her position as the chief source of coal supply for the Puget Sound market. Thus the imports for last year show deliveries in San Francisco as follows: From British Columbia, 310,371 tons; Australia, 70,414 tons; United Kingdom, 42,457 tons; Belgium, 3,651 tons; and other countries, 934 tons. The total being 500,655 tons. All the coal shipped from British Columbia is derived from the Vancouver Island collieries at Ladysmith, Nanaimo and Cumberland respectively, and owned by Messrs. Dunsmuir & Company and the Western Fuel Company.

In an official report, the Canadian Commercial Agent at St. John's, Newfoundland, refers to alleged discoveries of very valuable deposits of copper ore on the Exploits River, in the vicinity of Red Indian Lake, accessible to the railway, and not far distant from good shipping facilities. It is very likely that the report is true, for it is a well-known fact that Newfoundland has great potentialities as a mineral-bearing area. Notwithstanding which fact, practically no prospecting on anything like systematic lines has ever been attempted, which is the more strange as the mining regulations are singularly liberal.

The satisfactorily rapid growth of our iron industry is shown in some statistics recently published, wherein the increase in theirteen years is given at about 1,200 per cent., or an average yearly increase during this period of 100 per cent. Thus in 1894 the total output was only 44,791 tons, while last year this had grown to over half a million. Conditions are such at present that we may look for a still more rapid rate of increase in the Dominion's production of iron; in fact, the 1906 returns, which were twice those of 1904, sufficiently indicate the generally improved conditions of industry and trade.

During the nine months ending March 31st, 1907, the Department of Trade and Commerce paid out the sum of $266,555 on account of bounty to producers of petroleum in Canada. For the twelve months of the fiscal year, 1906, $291,157 was disbursed by the Department for oil subsidy purposes That, however, the bounty, is not altogether effective in stimulating Canadian production to the extent of putting a stop to the importation of foreign oil is somewhat forcibly attested by the fact that in 1906 Canada imported 30,804,575 gallons of petroleum, of which ten million gallons were refined oil for illuminating purposes.

A Government bulletin recently issued contains some interesting facts relating to capital employed in manufacturing establishments in Canada, notwithstanding that the returns are not too recent, the information applying to 1905. Nevertheless they may be used as a valuable commentary on Canadian progress, showing as they do an increase of over ninety per cent. in industrial expansion in a period of five years. To our readers the fact that the increase in the capital invested in electrical and smelting interests has, next to lumbering, been proportionately greater than in any other industry, will be especially gratifying, the capital invested in smelting in 1905 appearing as $87,482,829, as compared with $10,483,112 in 1900. Oother important advances are shown in connection with electrical apparatus and supply industries, foundry and machine shop products, iron and steel, and Portland cement.

The secretary of the Canadian Mining Institute has received notice, at the the instance of Dr. Alfred C. Lane, of Lansing, Mich., vice-president and chairman of Section E of the American Association for the Advancement of Science, of a summer field meeting of this section of the society (Geology and Geography), to be held from July 3rd to 10th at Plattsburg (in the region between Lake Champlain and the Adirondacks). Several informal addresses will be delivered on subjects germane to the field excursions, and papers are expected from Professors Fairchild, Davis, Kemp. Cushing, Woodworth, Hudson and others. The region to be visited is most interesting from a geological standpoint, and Dr. Lane believes that some of the members of the Mining Institute may be glad of the opportunity to be present at the meeting, to which they are cordially invited. Additional information in respect to the meeting may be obtained either from the secretary of the Canadian Mining Institute or from Mr. F. P. Gulliver, secretary Section E, American Asociation for the Advancement of Science, Norwich, Connecticut.

An interesting address was delivered recently in London by Mr. C. F. Just, of the Canadian Emigration Office, on "The Growth of Canadian Industries." After referring to the extraordinary development of Canadian trade in the last twenty years, Mr. Just discussed the bearing which coal and iron, water power and water transportation would have upon Canada's future as a great industrial country. It was a truism, he remarked, to say that the possession of coal and iron determined the position of a nation. The distribution and the present development of these resources left no doubt as to Canada's future. The iron industry was growing and consolidating itself at present in two divisions in Nova Scotia and Ontario, while a third, on the Pacific coast, is within the possibilities of the near future. Cape Breton, with the cost of production lower than in the States (*sic*), coupled with an unique position on the Atlantic, held the alternative of oversea markets in fee. Obviously the Ontario division was and must remain important, having a great aggregation of industries concerning iron and steel, with splendid facilities for distribution by water and rail. This view was confirmed by the decision of the United Steel Trust to establish large works at Sandwich, Lake Erie.

CORRESPONDENCE

To the Editor, CANADIAN MINING JOURNAL, Toronto:

Dear Sir,—I have received your letter of yesterday, congratulating me on the first hundred pages of the General Analytical Index to the reports of the Geological Survey. As yours is only one of several such letters, I take the opportunity of asking you to make it known, through the medium of your paper, that such congratulations are entirely unmerited.

Without the help of the officers of the Geological Survey the Index could not have been brought out in its present creditable form. Every officer to whom I have applied for information has gone out of his way to assist me. But for the Survey Palæontologists—and especially Dr. Whiteaves—the fossil references would have been a mass of errors; Professor Macoun and his son have given me the benefit of their knowledge in all things pertaining to natural history. Every reference to Nova Scotia has been carefully checked by Messrs. Fletcher and Faribault; those to Labrador, by the Director; those to Quebec, by Dr. Ellis; those to glaciation, by Dr. Chalmers, and so on, and so on.

There is scarcely an officer of the Department who has not materially assisted in the work.

I can understand your surprise at my knowledge of the geography of Canada. You will not, however, be so surprised, when you learn that Mr. James White, the chief geographer, undertook to put me straight as to any locality concerning which there was the slightest doubt, and that before the proofs are signed for press he checks every geographical reference relating to Canada.

The research work necessitated by the historical references has been, as you suggest, enormous, but here again I was aided by the Assistant Librarian, Mrs. Alexander, whose intimate knowledge of the contents of the Survey library saved me weeks of arduous toil.

Yours truly,

FRANK NICOLAS,
Editor of the Publications of the
Geological Survey of Canada.

The Quebec Mining Law

To the Editor, CANADIAN MINING JOURNAL, Toronto:

Sir,—Under the above heading I find in your edition of the 15th instant a criticism which would call for certain remarks. I, however, declare at once that we have no objection to our laws being criticized; we, on the contrary, would feel happy to see them made a point for discussion, particularly in your valuable paper. We don't contend that our mining law is perfect, but it need not be so to be worth other codes of law which have given rise to so many recriminations, contestations and costs.

For the moment you refer to three points:—

1st. That the prospecting license system favors the *speculators against the man with the pick, legitimate prospectors.*

2nd. That it constitutes a temptation for the Government employes to *show favoritism in mining permits.*

3rd. That it furnishes the occasion of realizing abnormal profits.

There may be something in the first argument, but it lacks development. The prospectors are on the same footing with other people, with the difference, if any, in their favor that, being better posted on the subject, they may come first. The list of our license-holders contains a good proportion of miners. License-holders, on the other hand, would generally be approachable on good terms by the prospectors, the usual share or interests in the discoveries being allowed to them with, in addition, the funds to face the expenses, and sometimes a salary. This has been done in some instances. Could not it he hoped, then, that should the prospectors and permit-holders agree, as we believe they will, the operations would be conducted with more method, without hurry or dispute. It is not either to be forgotten that the miners are prejudiced by the practice of a different system in other countries, and they are not inclined to deal kindly or even fairly with our mining regulations. In fact, I would esteem this discrepancy to be the strongest if not the only one argument against the Quebec laws.

The second point scarcely needs attention. After a ten or twelve days' trial, in which the defence was given a free hand, not to say the lead, you mention *one* witness who *swore that he had been a victim of a clerk's mistake.* This, it should be admitted, does not amount to much, and in the same circumstances we could find as bad under any code of laws, even the Dominion one, which I consider the best under the free mines license system.

As to the third allegation, I am not in a position to say that the witness referred to has not spoken the truth. But it does not matter much whether he did or not. If he did we will know some time where the happy land is situated, when the purchaser will call at the Department; in fact it is not to be set aside that the Province remains the owner of the lands under prospecting licenses. I refer you, then, to our articles 1443, 1445 and 1456 as to the apportionment to be made out of the ground covered by a permit in such a case, between the purchaser and the Department.

Another reply would be that large profits are often derived from mining speculations in any country, whatever its laws.

Believe, me, sir, your most obedient servant,

S. DUFAULT,
Deputy Minister Colonization, Mines and Fisheries.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay, July 2, 1907.—Following on the drawbacks to shipping experienced in Cape Breton during the month of May, the shipping department of the Dominion Coal Company have been making exceptional efforts during the month of June to overtake their St. Lawrence requirements, and they have succeeded in breaking all their previous records. During the week ending 29th June 65,342 tons were sent to Montreal. The best previous showing for one week was 57,515 tons. The whole 65,000 tons, with the exception of about 2,000 tons shipped at Louisburg, was loaded at the International piers in Sydney, and in one day—the 28th—the piers handled 16,500 tons of coal. There are not many places where shipments are made with such despatch and in such quantity as at Sydney. The success of the Coal Company in this matter is largely due to the specialized type of self-trimming collier which their St. Lawrence trade has evolved. In addition to the "Christian Knudson," the pioneer ship of this class, the company have chartered four others of the same type, namely, the "Borgestad," "Fritzoe," "Fornebo" and the "Kronprinz Olav," of them being 7,000 tons deadweight and 6.500 tons coal cargo capacity. These huge colliers are not things of beauty, and with their tall funnels aft, and their bristling array of derrick posts, look something like a centipede on its back, but as coal carriers they are a distinct success. A shipment of 65,000 tons in one week is pretty good, but the Dominion Coal Company's officials do not regard this as the limit of their powers, and they hope for still better things.

Springhill, N.S.—The Board of Conciliation in the dispute between the Springhill management and workmen on the local stone question met for a final hearing of evidence on the 3rd July. Much was said on both sides of the question, but little added to the former evidence. The award has not been made public at this writing.

The Grand Secretary of the Provincial Workingmen's Association and many of the best thinking men are heartily in favor of this method of settling disputes and will willingly abide by the award. It is to be hoped this feeling is general among the men. The arbitrators are men of unquestioned ability and integrity, and their finding should certainly stand. The manner in which Judge Graham, as chairman of the Board, handled the undisciplined opposing forces showed that he at least was no novice at the work. Mr. Archibald, C.E., is also experienced in matters of the kind, and by his calm, gentlemanly deportment won golden opinions from both parties. Mr. R. B. Murray, the representative of the man on the Board, showed up well throughout the investigation, but was rather arbitrary when fixing the award.

The collieries are working steadily, though a number of the men are not. The holiday season has much to do with this loss of time.

Manager Hargreaves leaves for a visit to England on the 19th of July. He will visit several of the Durham collieries while there.

ONTARIO.

Bruce Mines, Ont.—The Copper Mining & Smelting Company of Ontario, Limited, property at Bruce Mines, Ontario, is greatly favored by nature. It extends for four miles along the northern shore of Lake Huron and the mineral rights cover some five miles in depth, it being composed of the two locations known as Keating and Cuthbertson, now shown on the map as Plummer Additional. The Soo and Minneapolis branch of the C. P. R. traverses the property from east to west, whilst the embrionic Bruce Mines & Algoma Railway renders the same service from south to north.

The locations were made in 1846 and titles were granted by the Crown in 1854. From 1848 to 1872 Bruce Mines were known far and near as being the most populated and well-to-do town on the north shore of Lake Huron. Sault Ste. Marie was still a struggling village, with its great waterway without a thousandth part of its present marvellous procession of steamers forever ascending and descending from the Lake Superior ports. From 1872 to 1875 the price of copper was down to eight cents, and no development work was done, the mine being gutted with the usual sequel, a "cave-in" on a Saturday night, so that fortunately no lives were lost.

Estimates made by measurement of the excavations show that some 400,000 tons of ore were mined in this period, and close upon 50,000 tons of concentrates, averaging 20 per cent., were shipped to England, where they produced about $3,300,000.

From 1876 to 1898 the property lay dormant and was then purchased by a syndicate and the water pumped out from two sections so as to allow examination by mining engineers. Their reports being satisfactory, a company was formed in England and a large sum of money expended, principally on the surface. A fire took place and several other circumstances arising again, the place, when on the eve of showing its value, was shut down and work was not resumed until last year, when the workings were once more unwatered, and we are now at the point when we hope to reap the benefit of our work. Needless to say that if so much had not been done for us we would not be in the position we are to-day, just thirteen months after pumping started, and the extent of the workings reopened may be better estimated by the fact that we raised 27,000,000 gallons of water.

We have now about 14,000 tons of ore on the surface or lying in the stopes ready for hoisting, and we have not neglected development work, as our plans show some 30,000 tons of ore available for stoping, and by the end of this year we expect to augment this by another 40,000 tons.

The concentrating mill which we inherited was built by our immediate predecessors with a capacity of 400 tons per day. The process arranged is that after delivering the ore at the mill, distant 1 1-4 miles from the section of the mine we are working, to which the cars are taken by rail (standard gauge), they are hauled up a trestle by a specially designed cable hoist, the ore is crushed in a Gates crushed to 1 1-2 inch, then elevated and delivered by a Robins belt conveyor to the bins. It passes to the 30 inch x 10 inch rolls and is elevated to the sizing trommels, from thence to twelve Hartz jigs of three compartments. All the overflow or "chats" are returned to fine rolls and thence to another series of twelve Hartz jigs, afterwards passing to twelve Frue Vanners with 6 feet belts, the coarser particles being again crushed by a Bryan 6 foot mill and a pair of fine rolls, and the product fed at present to three double deck 14 foot concave buddles, finishing up on another series of six Frue Vanners.

We are now daily expecting delivery of a trial unit of the new Vacuum Process which is being manufactured for us in Canada. This is calculated to treat 40 tons a day, and as the preliminary tests made on our ores have shown a recovery of from 80 to 93.5 per cent., we hope to achieve a great economy, and in that case we shall remove the buddles and put in a complete installation of the Vacuum plant, our reason for doing this being that we have ascertained by measurement that we have some 120,000 tons of tailings left on the premises by the old-time workers, and as the average assay is about 1 per cent., if we only effect a saving of 80 per cent. of the contents we consider that a handsome dividend will result. Not only shall be reduce the usual percentage of loss occurring in all concentrating propositions, but we shall have a product which we propose to utilize in the manufacture of artificial stone for house building, street flagging, kerbstone and channels, etc.

With regard to the future, everything appears very promising. Negotiations are understood to be well under way for the extension of the Bruce Mines & Algoma Railway from its present terminus at Rock Lake, distant some 14 miles from Bruce, to a point on the main line of the C. P. R., and this with a view to a further extension north to meet the GrandTrunk Pacific. As a mineral field this road opens up great possibilities. Those few explorers who have been through this region assert confidently that copper and iron, both hematite and magnetite, merely await the advent of a road offering a cheap and speedy transport to a good harbor, which Bruce possesses. It is well sheltered and a lighthouse has just been erected by the Dominion Government, rendering the entrance perfectly safe, with the additional advantages of opening earlier and closing later than the ports on Lake Superior.

Again, this road is proposed to be operated by electricity, the splendid water powers on the Mississauga River being available at a minimum of cost. It is suggested that after utilizing such power as is required by the railway the surplus will be available for distribution and sale to all the countless enterprises which will spring up in the wake of this undertaking, and there seems to be no reason why the problem of electrical smelting will be amongst the least important.

The reopening of this old, historic mining centre has led to numberless properties, and also to various smelting propositions, being brought forward. Perhaps a word of warning to the investing public might be given as regards the latter, and the caution that we are adopting in not erecting a smelter of our own until such time as our development authorizes it might perhaps be adopted with advantage by those who are looking to mere prospects as a source of a steady supply of ore.

H. J. Carnegie Williams.

Bruce Mines, 6th July, 1907.

Wabigoon, July 5th.—It is reported from Wabigoon that the Laurentian stamp mill will operate only during the day shift. Scarcity of fuel has caused a temporary suspension of night shift work. A group of Toledo, Ohio, capitalists are working claims in the Manitou district.

Iron Bridge, July 8th.—A Toronto syndicate has established a camp on a copper property near Iron Bridge. This season will see active development of the properties. Superintendent J. Cassan is in charge, under the direction of Mr. O. N. Scott, Mining Engineer. There are several outcrops of chalcopyrite. The veins are traceable for some hundreds of feet. Stripping and prospecting are being pushed energetically.

Montreal River, Elk Lake P.O., July 1st.—On Downey's claims in the Township of James a four inch silver vein was discovered some days ago. Inspector Irwin, in looking over one of the claims, scratched up a piece of the vein. It has not yet been determined how extensively the silver is deposited in the vein. In two of the adjoining townships, Smyth to the north and Tudhope to the east, there is silver also. Your correspondent saw a vein about 1 1-4 inches wide, solid silver for about 18 inches in length, up in Smyth the other day. So far as is known, the silver seems to occurr in quartz veins in the diabase, a rather different occurrence from that of the Cobalt district. It is, of course, impossible to say how rich the district will be; but the indications at present seem to point to a considerable amount of silver. The whole country up here is staked out, and most of it recorded. At Bear Creek there is a population of about 150 to 200 persons, and a post-office has just been established. There are steam and gasoline boats running up from Latchford to here. There are two intervening rapids, namely, Pork Rapids and Mountain chute, which are impassable. Thus three boats are necessary.

The newspaper reports of the fires were largely exaggerated. Considerable country was burned over, no doubt, but there is no timber up here to be burned. The beast timber is the jack pine. There is very little spruce, and almost no red or white pine.

Cobalt, July 8th.—A miners' meeting is called for to-day. The situation is becoming grave and a general strike is feared. The companies have made decided concessions, and public sympathy will hardly be with the miners. Among the miners' demands is one for three shifts of eight hours each. The companies' schedule of wages was posted up on the 6th inst. It is as follows:—

"We, the undersigned mining companies, have agreed to the following scale of wages, to take effect at 7 o'clock Monday morning, July 8th, 1907:—Surface—Surface boss, $3.25 per day; carpenter boss, $3.25 per day; carpenter helper, $2.50; machinists, $3.25; pipe fitters, $3; head blacksmith, $3.75; blacksmith's helper, $3.25; other blacksmith's helpers, $2.50; engineers, 30 cents per hour; firemen, 25 cents per hour; head ore sorter, $2.75 per day; ore sorters, $2.75; head miner, $2.75; teamsters, $2.50; hoist man, $2.75; cage or bucket tender, $3.25; other surface labor, $2.25.

Underground—Timbermen, $3.25; machine men, $3.25; helpers, $2.75; cage or bucket tenders, $2.50; other underground labor, $2.50.

Board charges at the rate of $4.20 per week, or 60 cents for every day. A working day shall consist of 10 shifts, except Saturday, when total time shall be 16 hours, nine-hour day shift and seven-hour night shift, twenty-five cents extra per day to be paid machine men and helpers sinking in wet shaft.

THE CHEMICAL SOCIETY VISITS COBALT.

Q.—What is calcite? A.—It is an arsenide of silver.

Q.—Do they blast the rock or drill it? (Answer not recorded.)

Q.—Do you think the shaft house is the air receiver?

Q.—Are the veins on the Coniagas smaltite?

Statements by Members:—(1) I am interested in argentite because it is so much like nickel. (2) Compressed air is used for the purpose of making the mines nice and cool to work in. (3) A fault plane is a joint plane, because the stratified rocks here have no bedding and the dip could belong only to a joint plane. I am interested in seeing the vein end at a joint plane.

Final Query—Are the drifts run on a regular grade so that the water can drain out?

Your correspondent submits these queries to the general mining public and to the Cobalt fraternity in particular. The culpable ignorance of men who use compressed air merely to actuate silly drills is no longer excusable. The matter of the Coniagas veins must be settled at once, and a thorough invesigation should be undertaken to ascertain whether at the producing mines the shaft houses are bing properly used. There are, of course, certain types of receivers to which Cobalt concerns have a painful aversion.

In answer to Query No. 2, your correspondent is sure that the rock is blasted. Mere drilling could not, in his opinion at least, account for the interchange of courtesies between the Cobalt Lake Mining Company and the railroad contractors on the other side of the lake.

Is it possible that hitherto respected members of our community have sought argentite for reasons other than its resemblance to nickel? And how many drifts have been so laid out that the drainage water is given a chance to escape? These are pointed questions. Can Cobalt miners answer them?

MINING NEWS

NOVA SCOTIA.

Glace Bay, July 2nd.—The new bankhead at Reserve is in operation to-day and coal is being hoisted from the French slope and the Emory. A temporary suspension has been caused at the East Slope by the failure of the concrete pulley supports.

Sydney Mines.—The work of production at the blast furnaces and open hearts of the Nova Scotia Steel & Coal Company has so far this month exceeded all previous records since the works were established three years ago. The immense orders constantly coming in and the excellent quality of the output has necessitated the officials increasing their staff of skilled mechanics, and the month of June will go down in record as the best ever experienced by these two branches of the above company.

As in the blast furnaces and open hearths, so also in the different collieries of the company—increasing outputs and the installation of men and modern machinery. The latest acquisition to the colliery department was the putting in of an endless haulage system in No. 5 colliery, a system which will hereafter do away with horses in this particular mine for underground work, and will mean an output double that which has heretofore been awarded the company from No. 5.

The work of laying the two and a quarter miles of railway from No. 3 to the company immensely rich coal seams at No. 4 has been begun by Contractor Sutherland, who has a large crowd of men at work, rushing the work of construction, and with this addition to the company's plant the directors look forward to a much larger amount on the right side of the ledger than the handsome balance shown for 1906.

It is expected that the Sydney Foundry Company will establish works in Glace Bay. About 150 men will be employed.

Stellarton.—General Manager C. J. Coll, of the Acadia Coal Company, has given orders that all employes of the company will stop work on Saturday at 2 p.m. during the summer months.

Pictou.—The suit of Barlett versus the Nova Scotia Steel Company was settled, on June 21st, in favor of the plaintiff. The plaintiff was restored the title to the mining leases under dispute and awarded $2,250 for damages and costs.

The Dominion Mining & Smelting Company's copper smelters is being kept busy. The management is hopeful of solving the problem of constant ore supplies.

Glace Bay.—The Dominion Iron & Steel Company are putting in slopes at the head of Lingan Bay, between Bridgeport and Lingan Road.

Port Morien.—The North Atlantic Collieries Company are negotiating for the acquisiton of about twenty square miles of coal areas held by J. R. Cowans, of Springhill. The areas adjoin the Gowrie and Blockhouse properties at Port Morien.

Halifax, July 5th.—The enormous loading pier of the Dominion Iron & Steel Company at Bell Island Iron Mine, Wabana, Newfoundland, was destroyed by fire to-day. The pier ran out 200 feet from the shore. In its superstructure was machinery for operating the loading plant. About 5,000 tons of ore were lost, some thousands of tons of coal, and all the machinery. This conflagration, although not entailing a very heavy financial loss, will cause a great deal of delay and embarrassment. It is possible that the Nova Scotia Steel & Coal Company's pier, which is quite nearby, will be put at the disposal of the Dominion people during reconstruction.

ONTARIO.

Cobalt.—The Silver Queen Mining Company is considering the advisability of erecting a smelter to treat its own ores.

The new centrifual pump on the McKinley-Darragh copper dam was started working on June 29th. The erection of the dam is under the supervision of Mr. H. D. Sims, of Niagara Falls. When the water is pumped out of the McKinley-Darragh's corner of Cobalt Lake it is expected that a considerable quantity of fairly rich gravel will be bagged and shipped. The McKinley-Darragh people are still open-cutting on No. 7 vein. This vein shows good value sin silver and niccolite. It is about 7 inches wide.

A new spur line from Boston station on the T. & N. O. Railway to Larder Lake, 19 miles, is now under construction. The road also being built between Townstown and Windigo will be extended to Larder Lake.

Cobalt, July 5th.—The strike of the miners in the Nipissing, it is understood, is a strike of individuals and has not received the sanction of the Western Federation of Mine Workers. On July 2nd the men waited on Manger T. R. Drummond to submit a schedule of wages. Mr. Drummond promised to answer before July 7th. However, 300 out of 380 men quit work. Meanwhile, on July 4th, 165 men returned to work, and now men are being rapidly secured. On June 3rd the mine managers held a meeting and decided to adopt a uniform scale of wages.

The Nancy-Helen and Cobalt Lake compressor plants, hoists and dynamos are now in full operation. The Nancy-Helen is about to ship three cars of ore. The Cobalt Lake has three or more cars of ore on hand, but will not begin shipping until regular shipments can be guaranteed.

Sudbury.—At a meeting of the Nipissing Copper & Silver Company, held at Sturgeon Falls, it was decided to proceed at once with the development of the properties recently acquired. Mr. T. Baycroft, of Sudbury, was appointed mine manager. The company decided further to expend $50,000 in opening its properties.

Port Arthur.—R. J. Anderson, of Minneapolis, purchased from J. W. Andrews a lead property in Dorion Township. The property covers 316 acres. Mr. Anderson has put a gang of men to work and has announced his intention of putting up a smelter.

The Tip-Top copper mine, which has been worked for some years, has been shut down temporarily. The machinery now at the mine was transported in the winter. A large portion of the smelting plant lies at Kaskabowie, where it was unloaded from the Canadian Northern more than two months ago. It is stated that this plant was ordered under the idea that the Ontario Government would build a wagon road from the railroad to the mine. As a matter of fact, the Government did appropriate $3,000. The sum asked for was $6,000. When the Government was informed that its appropriation was insufficient it cancelled the whole amount and dropped the matter. The Tip-Top mine is a promising property. It has a large amount of ore, mining from 4 per cen. to 6 per cent. copper, already blocked out. A great deal of money has been spent upon it. The Government is expected to come to its help in the matter of road construction at least.

Considerable excitement was aroused here by the finding of a fine sample of gold-bearing quarz on Mackeys or the old Menzie Island. Free gold is also said to have been discovered in that vicinity.

The lack of a Government assay office at Port Arthur is keenly felt. The surrounding districts are being prospected. But calamitous effects often follow the delay and trouble in securing assay returns.

The Deloro Mining & Reduction Company, of Deloro, Ont., successors to the Canadian Goldfields, Limited, will soon have their new plant for the treatment of cobalt and other arsenical ores in operation. This company is in excellent shape for handling arsenical ore of all kinds, being fully equipped for the treatment of mispickel ore, which they have been working for a number of years very successfully. The new plant when in full operation will afford great relief to shippers of cobalt ore. Its capacity is from 10 to 20 tons per day, and it is the intention of the company to largely increase this. The editor of THE CANADIAN MINING JOURNAL expects to be in a position to more fully describe this plant in the next issue of THE CANADIAN MINING JOURNAL.

ALBERTA.

The International Coal & Coke Company, of Coleman, Alta., has announced its intention of putting on a double shift. This will have the effect of almost doubling the capacity of the Coleman mine. The output will approximate 2,800 tons per day, and will mean the employment of about 550 men.

The Alberta Coal & Coke Company, whose property is two miles east of Lundbeck, began shipping coal in the latter part of June. They are raising about 400 tons of domestic coal per day. Southern British Columbia and the State of Washington will be their market. The company contemplate the erection of a plant capable of handling 6,000 tons per day.

YUKON.

Dawson, Y. T., June 27.—Records in the gold commisisoner's office show the biggest placer merger the world has ever known has been perfected in Dawson, whereby the Guggenheim interests have taken over properties from the A. N. C. Treadgold, Northwest, Hydraulic Company, and Yukon Consolidated Goldfields Company, and other smaller concerns.

By the deal the Guggenheim people have absorbed all the placer properties in Klondike watershed, which have been worked by the old methods. Hundreds of claims—El Dorado, Bonanza, Hunker, Bear and their rich hillsides and tributaries—are included in the deal. It is estimated that the claims have cost the company ten million dollars, and five million dollars already has been spent for equipment.

It is said that the outlay for the equipment of the Guggenheim properties in the Yukon will represent the large sum of five million dollars. Nor does this seem an over-estimate, having regard to the extent of the area the syndicate has secured for operation. The syndicate recently paid to large holders of property a sum aggregating ten million dollars for their rights. The work meanwhile of constructing a hydro-electric plant on Little Twelve Mile River, for the purpose of supplying power for the dredges and the excavation of the big ditch, is proceeding rapidly, and it is expected that three steam shovels will be shortly in place for the expedition of excavation operations.

In all some nine or ten dredges will be operated in the Territory this season, these including three by the Guggenheim syndicate; the Canadian Klondike Mining Company's electrically driven dredge on the Boyle concession; the Lewes River Company's dredge; the Bonanza Basin Company's dredge at the mouth of Klondike River, and the Ogilvie Company's dredge on Klondike River; the Forty Mile Dredging Company's dredge on Forty Mile River; while another dredge will also be operated in this neighborhood.

BRITISH COLUMBIA.

It is repored that the Guggenheims have bonded the Big Interior mine in the Alberni district.

No. 4 Slope of the Comox coal mine has been sealed up. Water is being pumped from the remaining portions of the mine.

Victoria.—The Lenora copper mine, first opened in 1899, but for three years idle, is to be reopened by the Vancouver Copper Company. The working capital of the company is $150,000. The Vancouver Copper Company was formed in London, England, early this year. Shares to the number of 85,000, at a par value of $5, have been placed on the market.

Rossland.—Rich strikes of native gold are reported on the 7 inch and 11 inch levels of the Centre Star. Similar reports come from other mines operated by the Canadian Consolidated. No official confirmation of these statements has been received.

John Levcovig, skip tender at the White Bear, fell from the 300 foot level to the 1,000 foot level and was instantly killed.

General Manager Jay P. Graves of the Granby Consolidated Company, announces that plans are now under way for an increase of another 1,000 tons in smelter capacity at Great Falls, B.C. This will give the Granby smelter a daily ore capacity of 4,000 tons, but it will require a year to complete the improvements and additions. The additions will be paid for out of earnings.

Boundary.—At the Cariboo-McKinney ten stamps are in commission. It is estimated that a year's supply of ore is in sight.

The Dominion Copper Company's Idaho mine is shipping steadily. The large double drum hoisting engine, installed last winter, is being used to good purpose.

Mr. L. H. Moffatt, of Rossland, manager of the Rathmullen Mines, Limited, is opening a large copper ore ledge on the Greyhound mine, Deadwood Camp.

At the Diamond Fraction and Texas mine, near Greenwood, an electric hoist has been installed.

For the first time in its history, the British Columbia Copper Company of Greenwood has all three of its furnaces running. This means the reduction of about 2,000 tons of copper ore in 24 hours.

The Golconda group of claims in South Deadwood Camp is being opened up by Alex. Robinson.

Achilles J. Rainville, foreman of he Eureka mine, near Nelson, B.C., fell into the water 20 feet below the 150 foot level. The exhaust steam from the pump had so heated the water that the unfortunate man was fatally scalded.

MINING NEWS OF THE WORLD

GREAT BRITAIN.

A conference of miners' organizations was held in London last month to consider a line of action for raising the standard of wages in the different districts. The standard wages paid at the present time is the standard fixed over twenty years ago, and it is contended is now below the level of a living wage. In the English Federation districts the fixed maximum is 37 1-2 above the standard, and the present wage 50 per cent. above the standard. When in December last an effort was made to arrange for a new agreement, the owners resisted any change in the wage basis, on the ground that it was a long established basis and thoroughly understood by the employes. Certain concessions were, however, made by the coal owners. The position, therefore, is that while the men are unanimously agreed as to the policy of raising the existing wage by 30 per cent., the larger number of men employed are working under signed agreements which have two years and a half to run. Notwithstanding the new wage basis wished for is below the present minimum wage, and therefore would not disturb existing contracts, a resolution was finally passed recommending that each district shall approach the employers with a view of securing a new wage standard on a basis of not less than 30 per cent. of the present percentages upon which all future advances of wages shall be calculated.

UNITED STATES.

A consular report states that cobalt has been found in quantity in Grant County, Oregon.

Seven men were killed and two badly injured by two explosions in the Johnson mine at Priceburg, Pa., on June 18th. The first explosion was caused by the carelessness of a door tender. The second was a fire-damp explosion.

The United States geological experiments in the treatment of the black sands found on the Pacific coast are said to have been successful in demonstrating that platinum, besides other valuable minerals, may be readily and profitably recovered therefrom. There are large areas of black sand deposits on the west coast of Vancouver Island, from which from time to time gold has been extracted in paying quantities.

The United States Geological Survey proposes to establish an experimental station with a view to testing explosives used in coal

mining. The establishment will include an explosive gallery, rescue room, observation house, lamp testing room and explosives laboratory. Tests will be made by the pendulum and the trazl methods.

The production of coal in the United States in 1906 was 369,678,200 tons, valued at $512,610,744, and an increase of 5.4 per. cent. in quantity and 7.5 per cent. in value over the returns for the preceding year. Pennsylvania, of course, continues to occupy the first place in point of tonnage output, the contribution of this State being 48.4 per cent. of the country's total production. The second coal-producing State of the Union is now West Virginia, which has supplanted Illinois in this respect.

According to a report from Tacoma, Wash., the Tacoma Tin Smelting Hydraulic Company has arranged to secure necessary capital for the equipment and operation of its properties in the Clarence and other districts southwest of Nome, by giving a mortgage thereon to the Milwaukee Trust Company, of Milwaukee, to secure a $5,000,000 bond issue. Reference to this tin deposit has been made on more than one occasion by the United States Geological Survey, and there can be no doubt that the prospects for successful working are promising.

SOUTH AFRICA.

A correspondent writing to *The Colliery Guardian* describes in a very interesting manner existing labor conditions on the Rand. There is still, he remarks, a considerable shortage of cheap mine labor, although the situation has been greatly relieved by the importation of Chinese, who are paid by contract at the rate of a halfpenny an inch in the stopes, with a bonus of threepence on 36 inches, another of twopence on 48 inches and a third bonus of threepence on 73 inches, the 1-2d. an inch running all through. Unfortunately, however, the Chinese do not usually do more than 36 inches a day, as they are satisfied to earn just sufficient to provide themselves with opium and tobacco. This statement will not sound convincing to our Western readers, whose experience of Chinese is that they are indefatigable workers with the one main object in view of earning sufficient money to allow them to return to their own country on a compeence. But the explanation may be that the South African cooley is of an even lower type than his fellow-countryman in Canada.

AUSTRALIA.

Canada has still some distance to go before rivalling Australia's record as a mineral-producing country. If, however, gold be excluded our showing is quie comparable; but Australia continues to produce gold to the value annually of twice that of all other minerals combined. Thus last year the Commonwealth's mineral output, exclusive of gold, was valued at £12,149,405, or rather less than that of Canada, which in round figures, gold also being excluded, was $68,000,000, or perhaps £14,000,000. Our gold yield reached a value of $12,000,000 only, while Australia in the last two years has contributed £30,000,000 worth of the mineral to the world's supply.

Referring to the rather slow progress of the zinc industry at Broken Hill, an Australian paper remarks:—

At present there are five wet processes on the field—the Potter, Delphat, Cattermole, De Bavay, and Elmore, with the Gillies adoption of the Potter process to swell the total. So far, except at the Broken Hill Proprietary mine, where the Delprat process is worked, production is not on a large scale. The Cattermole process is understood to be giving satisfactory results at the Sulphide Corporation works and at the Zinc Corporation plant at the British mine, and the De Bavay process is said to be doing well at the North mine. It is clear, however, that expectations as to the rapidity with which the vast heaps of tailings were to be turned to account have been far from realized. All the talk of the profits that were to come, not only from the zinc recovered, but also from the associated lead and silver, have so far not been realized. The story that the Proprietary company were netting 40s. per ton on each ton of tails treated, therefore, is now relegated to the position it ought always to have occupied in the realms of fancy. Of course, with so many experimenters at work, advances in methods of treatment are being made, but that is about the best that can be said at the moment.

According to the official report recently issued, last year was one of exceptional activity and prosperity in the metalliferous mining industry in New South Wales, production having increased to the extent of 15 per cent. or £1,083,731 greater value than that of the 1905 production. At the same time this increase was very largely due to the rise in metal values, although an increased production is shown in copper and zinc. One interesting item in the return is in respect to precious stone output, the State having produced diamonds to the value of £2,120 and opals to the value of £56,000.

COMPANY NOTES

The bond issue of the International Coal & Coke Company, listed on the Toronto Stock Exchange, is $300,000, iinstead of $3,000,000, as reported. The capital stock of $3,000 is divided into one dollar shares.

The directors of the Mond Nickel Company, Limited, recommend for the year to April 30th a dividend of 12 1-2 per cent. on the ordinary shares, and a dividend of 33 per cent. on the deferred shares, placing £20,000 to reserve, carrying forward £18341. For 1905-6 the ordinary shares got 10 per cent., and the deferred shares 10 per cent.

At a meeting of the directors of the Dominion Iron & Steel Company, held this afternoon, two of the three vacancies on the board, caused by the resignations of Messrs. Pearson, Wood and W. B. Ross, were filled by the appointment of Messrs. George Caverhill and W. G. Ross, of Montreal. The appointment of a successor to Mr. W. B. Ross was deferred to a later date.

The Pittsburg Testing Laboratory Company have filed a petition at Osgood Hall for the winding up of the Stanley Smelter Works of Bannockburn, Hastings County. The claim is a protested cheque for $350. The treasurer of the company admits that it is indebted to the extent of $40,000, and is in trouble financially. About $70,000 of capital has been subscribed.

West Kootenay Power & Light Company, Limited (B.C.).—A meeting of the holders of the first mortage sinking fund gold coupon bonds will be held in Montreal on July 22nd to consider, and, if deemed advisable, pass a resolution authorizing the execution of a deed to the Royal Trust Company as trustees, providing for the payment of the bonds with interest thereon in sterling or Canadian currency.

Snowshoe Gold & Copper Mines (B.C.).—A meeting of this company was held in London last month. The directors submitted a report for the year ending September 30th, 1906, to the following effect:—During the greater part of the year the Snowshoe mine was closed down pending the completion of satisfactory arrangements for dealing with the property. On June 23rd an agreement was signed leasing the mine to the Consolidated Mining & Smelting Company of Canada, Limited. Under this agreement rather more than 6,000 tons of ore had been sent to the smelters, averaging approximately .08 ounces gold, .3 ounces silver, and 1.4 per cent. copper. The total royalties received thereon amounted to £1,997. Since the close of the financial year the original lease had been cancelled by mutual consent, and a new lease substituted, the terms of which were considered to be more advantageous to the company.

At a meeting of the Foster-Cobalt Mining Company's shareholders on June 27th it was decided to issue treasury stock. The amount of the issue is left to the discretion of the directorate. The stock is to be offered for fifteen days after July 10th at a

discount of 25 per cent. on par value. If it is not then taken up it may be offered to the public. Messrs. Jackson R. Booth and W. Hamilton Fisher were added to the Board of Directors. The total salaries of the board will now aggregate $7,000 per annum. The chairman, Mr. E. F. B. Johnston, K.C., declared that the payment of $45,000 in dividend had been a mistake. It should undoubtedly have been left in the treasury. The report of Mr. Frank Loring was read. Mr. Loring reported $60,000 worth of ore in sight. Mr. Adler, mine manager, said that $96,000 worth additional had been extracted. He recommended prospecting under Glen Lake. The present net indebtedness amounts to $11,000, plus the June accounts. All the resolutions passed with little opposition.

The annual meeting of the Dominion Iron & Steel Company, which was to have been held in Montreal on July 5th, was postponed indefinitely. The directors' annual report is given herewith:—

Before discussing the year's business your directors find it necessary to speak of the company's relations with the Dominion Coal Company, which have been seriously disturbed during the year. A memorandum covering this matter will be submitted. It may be briefly stated that in November last the Coal Company tendered large quantities of coal not in accordance with the terms of the contract, which it was impossible to use on the plant, that on the rejection of a portion of this coal the Coal Company declined to supply coal under the contract, that the company's operations have since been carried on with coal bought from various sources, including the Dominion Coal Company, Limited, but at very high prices, and that a suit is pending in the courts of Nova Scotia for the enforcement of our rights.

For greater convenience and regularity tthe coal used is charged against the operations at the contract price, $1.28 per ton, as heretofore, the excess cost has been charged to a special account with the Coal Company as part of the damages for which the suit is brought. Up to 31st May this amounted to $810,713.72, of which about $500,000 was paid to the Dominion Coal Company. The balance represents the extra cost of coal bought from others.

On this basis our earnings for the year were $2,247,536.45. The interest charges for the year were $684,384.82, and the net earnings $1,563,151.61.

From this amount we have transferred to contingent account $810,713.72 to offset the amount charged to the Coal Company for the excess cost of coal, leaving $752,437.89 of the earnings now available. Out of this we have written off the sinking fund of the first mortgage bonds, and the surplus has sufficed to cover the deficit carried from past years in profit and loss account and to leave a credit balance of $318,711.41.

The aggregate earnings from November to the end of February fell off about $250,000, as compared with the average of the preceding months of 1906.

This was due wholly to the disturbance and partial stoppage of our operations by the interruption in our coal supply. Bearing this in mind, your directors think that the year's results show satisfactory progress.

It had been hoped that a greatly improved financial position would have been shown this year as the result of surplus earings available for the liquidation of liabilities. But even under the exceptional circumstances met with, the company's affairs have improved. The greatly increased volume of business, which increases the amount of stock to be carried, and the policy of providing reserve stocks of pig iron and billets to ensure the steady operation of the open hearth furnaces and mills, account for an increase of $447,863.92 in liquid assets. Our current liabilities are a little higher, but the net indebtedness of the company is $192,221.19 less than last year.

During the year $306,335.57 was spent on capital account. The chief items under this head were the Bessemer plant, the extension and equipment of the coke ovens, new rolling stock, extension of the ore yard and its adjuncts, and extension of the plant at Wabana.

Your directors, being of opinion that the company must ultimately own or control its own coal mines, have secured options on several coal properties which are now being prospected.

Profit and loss statement May 31, 1907:—

Gross profits for 12 months	$2,247,536.45
Charges inst. of first mortgage bonds	385,387.51
Interest on 2nd mortgage bonds	120,293.44
Interest on current loans	178,703.89
Total	684,384.84
Balance net profits	$1,563,151.61

STATISTICS AND RETURNS

Shipments from the Springhill collieries of the Cumberland Railway & Coal Company, Springhill, N.S., for the month of June, were 34,310 tons.

The amount of bounties paid out on iron and steel for the nine months ending March 31st, 1907, was $1,299,801; petroleum, $266,533, and lead, $1,994.

The Dominion Iron & Steel Company's production for the month of June was:—Pig iron 23,000 tons; ingots, 24,325 tons; blooms, 208,000 tons; rails, 7,400 tons; iron rods, 6,700 tons.

The output of the Crow's Nest collieries for the week ending July 5 was 17,748 tons, or a daily average for five days of 3,549 tons. In the same week last year the mines had two holidays, Dominion Day and July 4, and the output fell to 11,692 tons, or a daily average of 2,923 tons.

The Consolidated Mining & Smelting Company's plant at Trail, B.C., received the following amounts of lead ore up to the end of May, in pounds. The weight of lead extracted is also given in pounds:—

	Ore.	Lead.
January	2,873,428	860,323
February	2,685,815	823,026
March	4,244,551	1,620,823
April	4,359,928	2,178,858
May	2,258,114	808,649

Cobalt re statement for week ending June 30th to July 6th, 1907:—

July 1st, Buffalo Mines, 120,000; July 1st, Nipissing Mines, 102,170; July 3rd, McKinley-Darragh-Savage Mine, 48,000; July 3rd, Coniagas Mine, 86,000; July 5th, Coniagas Mine, 186,000; July 3rd, Imperial Cobalt, 37,530; July 6th, LaRose Mine, 60,115; total, 639,815.

British Columbia ore shipments, week ending June 22nd:—

Boundary shipments—week, 32,080; year, 466,331.

Rossland shipments—Week, 6,285; year, 126,204.

Kootenay-Slocan shipments—Week, 2,856; year, 58,861.

The total shipments from the mines in the above districts for the past week were 41,211 tons and for the year to date 651,396 tons

---

British Columbia ore shipments, week ending June 29th:—

The Boundary district made a new shipping record last week, the output being 36,781 tons, or 7,000 tons larger than the previous week's output.

The returns from the other districts show a distinct gain, and the whole total is well above the average for the year.

Appended will be found the ore shipments in detail for the past week and year to date in tons:—

Boundary shipments—Week, 36,781; year, 503,112.

Rossland shipments—Week, 6,791; year, 132,995.

Kootenay-Slocan shipment—Week, 2,898; year, 61,759.

The total shipments from the mines in the above districts for the past week were 46,470 tons and for the year to date 697,866 tons.

Glace Bay, July 3rd, 1907.—The approximate outputs for June, 1907, from the mines of the Dominion Coal Company was as follows:—

	June, 1907 (approx.)	June, 1906. (actual.)
No. 1	47,270	43,534
No. 2	55,960	51,887
No. 3	33,560	37,525
No. 4	46,500	52,779
No. 5	57,500	59,370
No. 6	20,200	3,460
No. 7	.....	11,381
No. 8	21,720	24,934
No. 9	32,940	33,866
No. 10	8,640	3,158
	324,290	325,991

The shipments for June, 1907, were 375,938 tons, and for June, 1906, 343,169 tons.

COBALT ORE SHIPMENTS.

Following are the shipments for the week ending June 29th from Cobalt camp, and those from January 1 to date:—

	Week ending June 29. Ore in lbs.	Since Jan. 1. Ore in lbs.
Buffalo	60,000	993,830
Coniagas	434,000	2,901,860
Cobalt Central	.....	101,360
Colonial	40,000	74,250
Drummond	.....	44,090
Foster	.....	140,350
Green-Meehan	.....	196,780
Kerr Lake (Jacobs)	.....	249,000
LaRose	.....	689,782
McKinley	.....	60,000
Nipissing	63,120	2,516,183
Nova Scotia	.....	30,000
O'Brien	.....	2,159,254
Red Rock	.....	49,530
Right of Way	56,500	134,530
Silver Queen	.....	389,157
Trethewey	102,000	1,295,718
Townsite	.....	84,078
Temiskaming	.....	110,000
University	.....	61,383

The total shipments for the week were 755,620 pounds, or 377 tons.

The total shipments since January, 1907, are now 12,215,143 pounds, or 6,107 tons. In 1904 the camp producer 158 tons, valued at $136,217; in 1905, 2,144 tons, valued at $1,473,196; in 1906, 5,129 tons, valued at $3,900,000.

ENGLISH COPPER MOVEMENTS, MAY, 1907.

A good deal of attention has been attracted in the copper trade to the reduced demand from abroad. The full statistics for May show exports of not quite £23,000,000, which are some £20,000,000 under the record of a year ago. The exports for the eleven months of the fiscal year of £373,000,000 are £51,000,000 under last year's record. At the same time, copper imports are increasing greatly, due to enlarged production in adjoining countries. During May imports exceeded £10,000,000, or a gain of about £4,000,000, while for the eleven months' period they made the record-breaking total of £180,000,000, or nearly £30,000 more than during the preceding year.

London fortnightly copper statistics show an increase of 1,117 tons in the quantity in sight, and 817 tons in that on hand.

New Dividends

Montreal Steel Works, Limited.—Quarterly dividend of 1 3-4 per cent., payable July 8th, and in addition an interim dividend of 2 1-2 per cent.

Dominion Coal Company, Limited (N.S.).—The half yearly dividend of three and one-half per cent. has been declared on the preferred shares, payable August 1st next.

METAL, ORE AND MINERAL MARKET

Aluminium, No. 1 grade ingots—46 cents per lb.
Antimony—10 to 14 cents per lb.
Arsenic, white—7 1-4 to 7 1-2 cents per lb.
Barytes, crude—$11.25 to $14.50 per short ton.
Bismuth—$1.50 to $1.75 per lb.
Cadmium—$1.40 to $1.46 per lb.
Carbons, for drills—$78 to $85 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, metal pure—80 cents per lb.
Cobalt, f.o.b. Cobalt, Ont., unrefined—35 to 50 cents per lb.
Corundum—7 to 9 1-2 cents per lb.
Feldspar, ground—$12 per short ton.
Flourspar, lump—$10 per short ton.
Graphite, domestic—$50 to $150 per short ton.
Gypsum, lump—$4.50 per long ton.
Infusorial earth, ground—$25 to $30 per ton.
Lead—5.25 cents per lb.
Manganese, pure metal—75 cents per lb.
Mica, ground—$80 per short ton.
Mica, scrap—$15 per short ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 95 per cent. pure—$4.50 to $5 per unit.
Nickel—45 to 50 cents per lb.
Platinum, ordinary metal—$26 per ounce.
Platinum, scrap—$20 to $21 per ounce.
Pyrite, 38 per cent. to 45 per cent. sulphur, lump, 10 1-4 to 11 1-2 cents per unit.
Quicksilver—$41 to $42 per 75 lb. flask.
Talc—$18 to $23.50 per ton.
Tungsten, pure metal—$1.25 per lb.
Tungsten ore, 60 per cent. pure—$400 per ton.
Tin—42 1-2 to 42 3-4 cents per lb.

MARKET NOTES.

Spelter.—Prices have lowered. New York, 6.27 to 6.32 cents per lb.; London, £24 per long ton.

Lead.—The lead market has fallen. New York, 5.25 cents per lb.; London, £20 15s. for Spanish lead.

Northern Pig Iron.—Last half delivery; No. 1, foundry, $24.50; Bessemer, $24.

Tin.—The tin market is firm at 42 1-2 to 42 7-8 cents per lb.; London, £199 for spot.

Copper.—A late despatch from New York announces a break in copper prices. Electrolytic, 22 cents per lb.; lake brands, 22 1-4 to 23 cents per lb.; London, £99 17s. for spot.

Silver.—June 20th, 67 1-4 cents per ounce; June 21st, 67 1-8 cents per ounce; June 22nd, 67 3-8 cents per ounce; June 24th, 67 3-8 cents per ounce; June 25th, 67 3-8 cents per ounce; June 26th, 67 1-4 cents per ounce; June 27th, 67 1-8 cents per ounce; June 28th, 67 1-8 cents per ounce; June 29tth, 67 1-4 cents per ounce; July 1st, 67 3-8 cents per ounce; July 2nd, 67 3-8 cents per ounce; July 3rd, 67 3-8 cents per ounce.

WANTED

MINING MACHINERY FOR SALE

Splendid opportunity to secure some good machinery far below the price of new and all or any part of it can be delivered on the cars in one week.

One Class D Rand Cross Compound Condensing Duplex Air Compressor having a capacity of 835 feet of free air and will run 10 No. 2 Rand Drills. High pressure steam 14 x 24, low 22 x 24, air cylinders each 14 x 22. Has Myers' patent steam cut off valves and machanically operated air valves. Machine good as new.

One double cylinder, 10 x 16, Lidgerword Hoisting Engine. Drum, 54-inch diameter and holds about 700 feet of wire rope without overlapping. End friction and friction hand break. This machine is as perfect as the day it left the shop.

Lots of Steam Pipe ranging from 2 to 5 inches.
Light Steel Pit Rails about 14 pounds.
Steel Piping Tools from 2 to 5 inches.
One Heavy Duty Steam Mining Pump.
One Northy Duplex Steam Boiler Feed Pump.
Rand No. 2 Rock Drills and Barrs.
Rock Drill Steel ready for machines and in good lengths.
One 15 H. P. Steam Engine.
One 25 H. P. Steam Engine.

These engines would be just the ones for a saw mill or could be used as a pumping engine for a mine. Steel Ore Car Bodies just the thing for underground work. This lot of odds and ends will be sold low for cash.

For particulars address, G. M. this paper.

Mining Graduate (McGill) with eight years practical experience metal mining and management, would like to secure a position in the Cobalt district. Used to organizing and handling large output at minimum cost

Interested parties kindly reply to
A.C., care of Canadian Mining Journal

IRON AND PYRITES CLAIMS FOR SALE

Several undeveloped iron claims and several partially developed pyrites claims, within one mile of line of Canadian Northern Railway, 50 miles west of Fort William ; and an undeveloped copper and silver claim near Nipigon, for sale.

Particulars P.O. Box 512, Fort William, Ont.

WANTED AT ONCE.

Young mining graduate with some practical experience to do some work in the province of Ontario. Apply at once to

Fritz Cirkel, M.E., 80 Stanley St., Montreal

MINES AND STOCK FOR SALE

Four Copper Mines assaying high in silver and gold. Nickel Mine running about $68.00 to the ton in silver and situated twelve miles from Sturgeon Falls. Assays and mines can be seen at any time. Also a few thousand shares of Nipissing Copper and Silver Co., Limited. Apply to

R. Niffin, Smoky Falls, Ont.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of ihe Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who posses properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the serviees of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

WILLIAM ABBOTT, Sole Agent for Canada,
44 St. James Street, Montreal, Que.

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre ;

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions : The full price must be paid in cash ; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands ; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to :

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

CANADIAN PACIFIC RAILWAY CO'S Empresses of the Atlantic

NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long 65½ feet broad 14,500 tons

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

UNDERWOOD

The Underwood is the best typewriter. But even the best typewriter would be of little use without an operator. Underwood operators are always available.

All the commercial schools of any importance teach the Underwood exclusively (and school men are keen judges of typewriters). Skill in operation is acquired only under expert instruction.

With other machines you have to put up with poorly trained incompetent typists. With an Underwood you are safe. Through our Employment Department we supply nearly 1000 stenographers a year. All-round typewriter satisfaction is secured only with the Underwood.

United Typewriter Co., Limited, 7 Adelaide Street East, Toronto

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Spring Catato6ue was ready for mailing on the first of March. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our Spring Catalogue for 1907 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the special Summer Catalogues.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

Our Analyses Speak for Themselves.

R. G. DRINNEN, Superintendent. **G. G. S. LINDSEY,** General Manager.

Port Hood Coal

Is the Best House Coal in Canada

We may say, without fear of successful contradiction, that the coal now being mined by us at Port Hood is equal to or better than any now being mined in this Province. It is meeting with general approval from *dealers, consumers and manufacturers.* All who are open to make contracts for Summer or Winter delivery should write us for special terms at once. "New and powerful tug boat to attend to all vessels." Deliveries effected by large or small steamers, or via rail

THE REASON WHY

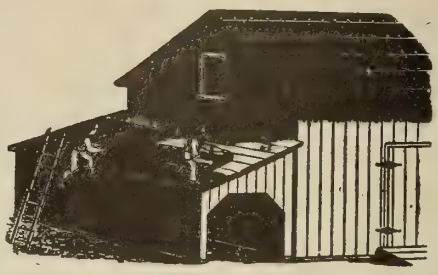
The enlarged diagram above tells the story. If you examine it you will notice that it is composed of five different layers.

In fact amatite is made on a different principal from any other roofing. Instead of a smooth skin coating *made to receive a coat of paint,* Amatite has a rough surface of small particles of hard silicious rock such as seen in quartz or other hard stone when examined under a microscope.

This mineral surface is chosen for its weather resisting qualities, and does away *absolutely* with *painting* and *coating*.

Underneath the mineral surface are alternate layers of long-fibre, wool-stock felt of the very best grade, and between each sheet and under the mineral surface on the top is a layer of specially prepared Coal Tar Pitch, *the greatest waterproofing material known.*

This short description will give you some idea of how carefully Amatite is constructed and what effective protection it will give against weather of all kinds



The best proof, however, is to see a Sample, which we will send to any-one free upon receipt of their name and addrhss to nearest office.

Twenty-First Year. Established in 1887

The Mining Manual

For 1907

By WALTER R. SKINNER

Contains all the latest information up to within a few days of publication. The Standard Reference Work on Mines. 1,600 pages. In demy 8vo, cloth. Price 21/-, post free.

A Record of Information concerning Mining Companies (Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, and Exploration Concerns, etc.)

Arranged in Three Sections, **Australasian, African, Miscellaneous,** with Tables of Crushings at ends of Sections, followed by List of Mining **Directors and Secretaries,** their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected; also **Mining and Consulting Engineers and Mine Managers,** with their Company connections, and a **Dictionary of Mining Terms.**

THE MINING MANUAL FOR 1907 contains particulars of no less than 3,100 COMPANIES, arranged in three sections, 450 Companies being AUSTRALASIAN; 1,050 AFRICAN; and 1,600 MISCELLANEOUS (including Siberian, Mexican, Indian, Canadian, American, etc., and the Coal, Iron, and other mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; position at mine and ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts.

The Lists of Directors (over 7,000) and Secretaries (1,750) include their addresses and descriptions and names of the Companies with which each particular Director or Secretary is connected.

A complete Alphabetical Index, including many useful items of reference, occupies 40 pages.

Leading Features of a Good Rock Drill

No. 1.—ACCESS TO WORKING PARTS

Convenience of access, particularly in regard to the rotating mechanism, is a feature which has received special attention in the design of the Rand "Little Giant" Rock Drill.

Through the arrangement of collars on the side rods the ratchet and pawls may be inspected by merely removing the ratchet box cover, doing away with the necessity of loosening the heads of the drill, or taking the tension off the buffer springs.

This is one of the improvements on our "40" series drills. The others are fully described and discussed in our new catalog. Do you want a copy?

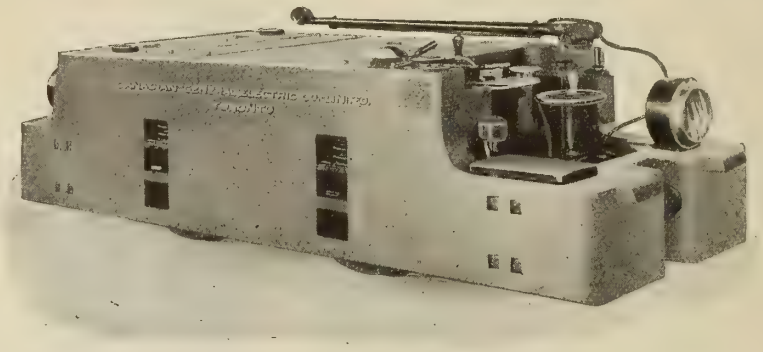
McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.



A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

ANOTHER SUGGESTION

In our last issue reference was made to the unprofitable period of quiescence, intervening between the annual meetings of the Canadian Mining Institute. We wish now to touch upon another matter, which, we submit, is of paramount importance.

Under the system now obtaining, the offices of Treasurer and Secretary are distinct. The Treasurer is remunerated at the discretion of the Council. He regulates and records all receipts and disbursements. All cheques for money to be paid are signed and issued by him, and all cheques and other negotiable paper made payable to the Institute are endorsed by him. At the end of the financial year he presents a duly audited statement.

The Secretary resides in Montreal. Upon him devolve the duties of keeping a true and correct record of all the proceedings of the Institute, and a correct list of the members and student members. He conducts the correspondence of the Institute, issues notices of meetings and has the seal of the Institute in his keeping. He, also, is remunerated at the discretion of the Council.

The duties of the Treasurer are light. His remuneration, we understand, amounts to $500 per annum, and only a small fraction of his time is devoted to the service of the Institute. The Secretary, on the other hand, is kept at least fairly busy and receives a regular salary.

With these preliminary explanations we wish to lay before the members of the Institute a few carefully considered proposals.

It is undoubtedly true that the matter of remuneration should not be left to the discretion of the Council. In practice, this tends to render the Secretary's position insecure and in certain matters weakens his hand. The division of the offices of Secretary and Treasurer is unnecessary at present. Were the two functions combined and the salary of the Secretary-Treasurer fixed at a sum equal to the total now received by both officers, the new position would be one of much greater dignity and strength. Indeed, we would go farther. We venture the prediction that, were the Secretary's position thus strengthened and were he assigned a respectable sum of money for travelling expenses, the membership of the Canadian Mining Institute could be doubled within twelve months. And it must be remembered that with a membership of one thousand the matter of the Secretary-Treasurer's salary and travelling expenses would be relatively smaller than at present.

Without doubt, the Institute needs revivifying. Equally without doubt the office of Secretary is not clothed with sufficient authority or discretion. The

logical means of infusing life and energy into the body corporate lies in making it worth while for one man to use all his time and energy in active organization and in keeping the affairs of the Institute constantly moving.

The mining industry of Canada has grown so rapidly of late years, that now, more than ever before, there is need of watchfulness. The promotion of special and class legislation, inimical to the best mining interests, should be promptly and strongly opposed. Branches of the Institute should be aided and encouraged, financially and otherwise. The present provision for the financial aid of branches is vague and the attitude of the Institute is not as favorable as might be desired.

To illustrate the need of unremitting alertness, it is only necessary to cite the following instance: When the Canadian Mining Institute was opposing the passage of the Mines Taxation Act in the Ontario Legislature, last winter, the Government emphasized forcibly the fact that nothing had been heard from the Institute until the bill had been for many months before the House. It was implied that if the mining men had been up to their business, they would have been heard from long before.

As it was, the Ontario Government heard only an ill-digested, conflicting mass of individual opinions.

Perhaps we have said quite enough to demonstrate the need of injecting life into the Canadian Mining Institute. We particularly request expressions of opinions from members of the Institute. The questions outlined above are urgent. They can be discussed entirely without personal animus. But they must be settled before the Canadian Mining Institute rises to its proper standard of practical helpfullness and dignity.

THE PERSEVERANCE OF A PREJUDICE

The belief that mining is essentially a department of the profession of gambling appears to be ineradicably fixed in the minds of the great majority of men. The element of "bull" luck upon which the ordinary prospector is supposed to depend has been largely responsible for this mischievous idea.

As a matter of cold, hard fact, no wage earner works so hard, tolerates such privations and is so scantily remunerated as the prospector. Most assuredly both the prospector, and the mining company that follows him, take chances. But who does not? Is the enterprising dry goods merchant, who starts a business in a new town, sure of his profits? If he is a sane man he will, of course, prospect his field, and estimate as nearly as may be its possibilities. But in all this he consciously accepts the risk of failure. And a not inconsiderable proportion of all new business ventures are doomed to failure.

The prospector, if he knows his business, prospects only the *probable* districts. Like the dry goods man, he must accept the risk of failure. But failure means to the prospector merely the necessity of continuing prospecting.

Thus, before the investor enters the field, the possibilities of loss are limited to the mere expenses of prospecting. With the investor, larger issues are introduced; and it is at this point that ample precautions can be taken to reduce the element of chance to a minimum. In fact a mining investment can be, should be, and often is, as safe as the most conservative industrial venture.

The necessary precautions are embodied in this sentence of advice: "Before investing in a mining property secure the services of a reputable, experienced and competent mining engineer." The business of the mining engineer is to examine mines and mining prospects. He must estimate the probable value of a mineral deposit, considering carefully the conditions of fuel supply, transportation, labor, and a dozen other factors, all of which have a direct bearing upon the cost of development. In many cases this can be done with approximate exactness. In other cases it is only possible to make an intelligent guess at either the value of the deposit or the probable cost of extraction. But in all cases it is possible for the investor to know what he is buying, whether a certainty, a probability or a "gamble." If he buys the last variety he has only himself to blame if he is disappointed ultimately.

GREAT BRITAIN'S FUEL EXPORTS

There has been a noticeable increase in the amount of coal shipped by Great Britain to France, Germany and Italy during the first five months of the current year, as compared with the corresponding months of 1906. The total value of fuel exported during 1907, up to and including the month of May, was $74,165,627, an increase of $13,000,000 over the corresponding period of 1906. Of this total France took 4,507,011 tons, Germany 3,382,734 tons, and Italy 3,371,836 tons. Thus France consumes, by a considerable margin, the largest amount of British coal. Italy and Germany take quantities less than does France, but large enough to be important factors in the grand total.

The next largest consumers are Sweden, Holland, Egypt, Denmark, Spain and the Canaries, and the Argentine Republic. All of these nations have received shipments, during the first five months of 1907, which in each case aggregate about 1,000,000 tons..

The largest increases in shipments are in those to France and Germany, both nations having taken about 500,000 tons more during the period specified in 1907 than in 1906. The United States received only 23,000 tons during 1907, as compared with 40,847 during 1906

LARDER LAKE

It is probable that the wilful misrepresentation of speculators has damaged the Larder Lake district to such an extent that its future will be seriously affected. The columns of Toronto newspapers and of publications all over the country have been freely used for the purpose of selling that which is not. No account was taken, in these iridescent misstatements, of the extreme costliness of transportation and of installation. If we are correctly informed, there is not yet a stamp mill in operation in the camp. Large quantities of machinery are assembled at points near the railroad. But between the delivery of machinery and its actual installation and successful operation a great gulf is fixed.

In any case, the first operating stamp mills in Larder Lake will be of the light prospecting type. The capacity of these mills is small. Very rich ore will be necessary to give any reasonable return on the money invested. But we have reason to believe that Larder Lake's future will depend, not upon "spotty" and uncertain rich ores, but upon the large bodies of low grade gold ore. The small margin of profit on these latter ores will necessitate large and expensive plants. It is not, then, in our opinion at least, highly probable that Larder Lake will become a steadily producing camp until the present conditions of transportation are vastly improved. But another requisite is the elimination of the "boomster" and the "fakir."

COBALT'S STRIKE

The strike situation, of which full details have been given in the daily press, is still acute. It has been resolved, apparently, into a trial of strength between the managers and the men. As is always the case, both sides have been guilty of tactical errors. So far, however, as the strike itself is concerned, there was not the slightest excuse for its declaration. The miners' complaint boils down to this, not that they were treated badly; but that it was possible that they might be treated better. The representatives of the men, in the face of recent events in the West, disregarded the machinery provided by the Federal Government and declared the strike when and how they saw fit. In this they should be condemned by all law-abiding citizens.

BRITISH COLUMBIA'S MINES IN 1906

The annual report of British Columbia's Provincial Mineralogist, Mr. W. Fleet Robertson, has been issued. It officially confirms the gratifying announcement that the mineral production of that Province for the year 1906 exceeded that of the preceding year by 11.2 per cent. The total value of the production was $24,980,546. On another page fuller statistics are given.

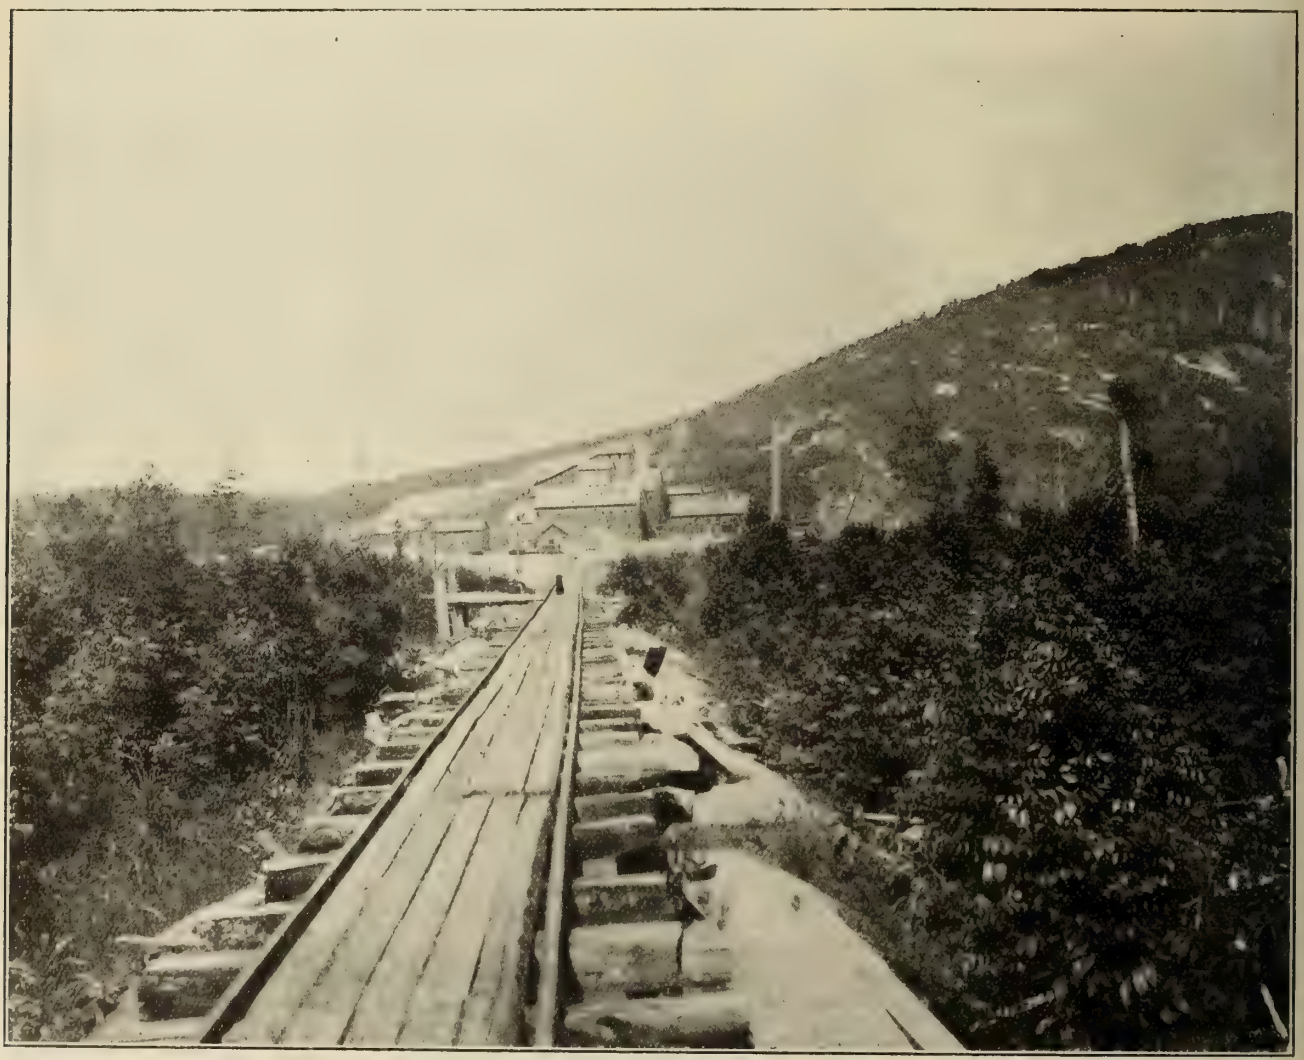
It will be a matter of surprise to many readers that up to and including the past year the value of coal mined in British Columbia is greater than that of any other mineral. Placer gold comes next and lode gold third.

The report is a credit to the Mines Department of the Province. In Mr. Robertson the people of British Columbia have a capable and energetic servant.

CORUNDUM AT CRAIGMONT

By H. E. T. Haultain

The Canada Corundum Company, Limited, at the present time is treating ore only from its Craig mine, situated on Craig Mountain at Craigmont, in the Township of Raglan, in the County of Renfrew, Ontario. Craig Mountain rises to a height of about 400 feet above the valley of the Madawaska River, and on its southern slope conforms to the dip of the foliation of the gneissic rock of which it is formed. Corundum occurs as a constituent of this rock, not uniformly throughout its mass, but scattered through layers interbedded with barren rock. These layers vary in thickness from a few inches to more than 20 feet. The mining operations have been confined entirely to the surface, the deepest workings being open cuts with faces of less than 40 feet. The corundum occurs in crystals irregularly distributed, and of all sizes up to 60 pounds in weight. In general it is of a brown color, varying from almost white to black. Various shades of yellow and pale green are common, red and blue occur rarely. The larger crystals frequently have considerable mica along the parting or separation planes. The chief constituent of the containing rock is sometimes feldspar and sometimes nepheline. This rock has been called syenite, and if we leave its origin in obscurity this will be a good name for it, though it would perhaps be well to modify it to gneissic syenite or syenitic gneiss. Associated with the corundum are found hornblende, mica, garnet, magnetite, iron pyrites, zircon, and other minerals. Small dykes (pegmatitic?) cut irregularly through the gneissic formation, composed chiefly of feldspar, but carrying also quartz and hornblende. There are several small veins, some in contact with the dykes carrying quartz, scapolite, calcite, iron pyrites, molybdenum, apatite and specularite. Outside of these dykes and veins no quartz has been seen in any of the workings.



On the higher and more exposed parts of the hill the rough crystals of corundum stand out firmly from the enclosing feldspar, showing their better weathering

qualities, while lower down the hill the surface, protected by sand and gravel, shows both feldspar and corundum ground away by glacial action to an almost equal polish.

Craig Mountain is practically a mile in length, but the mining operations have been confined almost entirely to a portion of the eastern third, which is in the immediate neighborhood of the mill, but throughout the full length of the hill surface outcroppings show corundum with the same general characteristics of formation persistent from east to west.

Of the origin of the corundum in these rocks very little is known. It is work for the ultra specialist in geology and petrography, and calls for laboratory as well as field work. Those who have studied it most deeply have not yet published their conclusions. The only opinions that the writer has ventured to have on the subject are to the effect that the corundum-bearing rocks are not dykes, that they are not eruptive, and that there is no sign of segregation from magma. How, when, or why the corundum was formed is beyond the writer's line of work.

The first discovery of corundum in Ontario was made nearly thirty years ago on this Craig Mountain, then known as Robillard's Hill by Henry Robillard's daughter. As a small child she picked up and carried home a crystal that "looked like a cruet stopper" For years it remained an unnamed curiosity, but at the time of the phosphate excitement it was declared to be phosphate, and Robillard and Fitzgerald located the ground as a phosphate mine. In 1896 Ferrier, of the Geological Survey, described the presence of corundum in the neighboring township. Mining operations were commenced May, 1900, the ore being transported in wagons half a mile to a small mill built on the site of a small water power. In March, 1904, the present large mill commenced crushing. This mill is by far the largest corundum mill ever built, and is the largest concentrating plant in Canada. It has three divisions, the main mill, the grader, and the finishing department, the latter a comparatively recent development. In the main mill the rock is crushed till 90 per cent. of it will pass a 2.5 millimeter round hole, by means of four rock-breakers and five sets of rolls. It is concentrated on 20 Overstrom tables; the concentrates, which contain from 50 to 60 per cent. corundum, passing into bins for drainage. In the grader these concentrates are dried, pass over magnetic separators, sized into 20 sizes from 8 mesh to 200 mesh, and still further subjected to concentration on Wilfley tables and Hooper pneumatic jigs. The resulting product is again dried and again sized and passed into bins, from which it is drawn off into 100 pound bags. Each day's run of bags is sampled by hand, each size by itself, and these samples are carefully assayed, and according to

MILL AND SOUTHERN SLOPE OF CRAIG MOUNTAIN

the assay results the bags are stocked in position in the finishing department. The finishing department performs three functions. It thoroughly mixes the product so as to give a uniform material complying closely with fixed standards. It re-screens each size so as to eliminate the results of carelessness in the grader. It automatically samples every lot of thirty bags. The finishing foreman, knowing the assays of the contents of his bags, mixes thirty hundredweight at a time in a hopper. From this hopper the corundum passes in a thin flat stream past a draft of air, which blows away the mica. It then passes over a set of shaking screens, which screen out both undersize and oversize, and from this it passes to a bin whence it is drawn off past an automatic sampler direct into canvas bags, which are filled to contain 100 pounds of corundum. These bags are then sewn up by machinery and marked for size and lot number. The samples are tested by hand screens for accuracy of sizing, by the eye for pyrites and hornblende contents, by a magnet for magnetite contents, and in the assay office for both corundum and iron content. On the receipt of the assay results, the bags are marked G or G1, G grade being for silicate wheels and the polishing trade, and G1 for the vitrified wheel trade. A sample weighing about half a pound representing each lot of thirty bags is stored for reference. In the winter the bags go by sleighs 21 miles to Barry's Bay on the Ottawa Division of the Grand Trunk Railway, and in summer to the same place by barge and steam tug. From here they are shipped to all parts of Canada and the States, and to stock storehouses in Manchester, Paris, Antwerp and Hamburg for distribution in Europe.

In 1906 the mill produced 2,900 tons of finished grain corundum, and is being constantly improved and added to, to handle both larger tonnage and lower grades of ore. During April and May a little short of 7,000 tons of rock were crushed each month. Rock containing as low as three per cent. corundum is successfully treated.

Corundum is the second hardest mineral, the only other equalling or surpassing it being the diamond. On account of this hardness, and on account of its peculiar form of fracture, it makes an ideal abrasive material and is used as such both for grinding and polishing all over the world in all classes of work. As with nickel, cobalt, mica and asbestos, Ontario holds a unique position in regard to corundum. She has practically unlimited deposits The Canada Corundum Company has extensive areas in six townships, besides the one on Craig Mountain, and produces from this one deposit considerably more than all the rest of the world.

Before 1900 the hard abrasive field was held almost entirely by emery, which is a natural product, consisting of a mixture of corundum and magnetite and hematite. Carborundum, the trade name for carbide of sili-

THE MILL OF THE CANADA CORUNDOM COMPANY

con, an artificial product manufactured in the electric furnace, was at that time coming strongly into the market and has since then made great strides. It is of about the same hardness as corundum, good crystals of it being somewhat harder and able slightly to scratch the corundum crystal, but it differs very much in the form of fracture and in the shape of the grains and of the cutting edges. Recently there have been put on the market other artificial abrasives, of which perhaps the most important is alundum, an artificial corundum made in the electric furnace from bauxite. Good compact specimens of this are as hard as corundum, but the fracture and form of cutting edge is very different and the product varies in texture.

CRAIG MOUNTAIN AND MILL

These four hard abrasives, emery, corundum, carborundum and alundum, practically hold the market, but corundum does not hold the place that its qualities warrant. Emery holds its position by right of age. For so long a time was it the only hard abrasive that its name began to have a general application, being used instead of the general term abrasive rather than as applied to a specified mineral. Even to-day all classes of manufactured grinding wheels are called emery wheels; even the Corundum Company's own men refer to corundum wheels in the machine shop as emery wheels. Carborundum and alundum have had the advantage of magnificent advertising. Alundum is controlled by what is probably the largest and oldest abrasive wheel concern in the world. They make a specialty of it and practically confine the use of it to their own goods. Carborundum is also treated as a specialty, the company manufacturing it also making it up into all forms of wheels, blocks and papers, and controlling the sale of the articles manufactured from it. The controlling use of a special product and its special name is in itself a splendid trade asset.

Corundum has been handled on a different basis. It has been considered a raw material and has gone into the market as a competitor of the raw material emery, and it has been free to the use of anybody who chose to buy it. It is easy to be wise after the event and it is too late now for criticism, but the writer thinks that if the policy adopted by the owners of carborundum had been followed by the Canada Corundum Company, corundum would have travelled much further, in fact might to-day have been almost alone in its position in the abrasive field, instead of being one of several. The making of an abrasive wheel is a difficult art; it is easy to make a poor wheel out of the very best abrasives. It takes capital, effort, experience and skill to make a good wheel, but it takes much more capital, greater effort, a far wider range of experience and a much more extensive organization to produce the grain corundum. Grain corundum is not a raw material; it has required very

much expensive experimenting, and the combined experience of many men gathered in all parts of the world to produce the high grade uniform product of to-day. But the policy of selling to everybody has been adopted and will in all probability be adhered to. Of late years the Canada Corundum Company has done very little advertising. In its earlier years it advertised fairly extensively; in fact the publicity department was far ahead of the production department, and it was impossible at that time to make good on the promises held out to the public. For more than eighteen months past the cost of advertising has been less than $100, and only for a few weeks did the company have a salesman in the field. There was practically no solicitation of orders by mail. All that was bought sold itself. The sales for the past three years have been as follows:—1904, 855 tons; 1905, 1,545 tons; 1906, 2,700 tons. This is a very remarkable record, for the public is so accustomed to advertising in these days that it thinks there must be something wrong in an article not advertised. The most exclusive monopolies advertise—Standard Oil not only advertises, but makes extensive use of salesmen. The Canada Corundum Company has had a big problem; it has had its full share of difficulties, and it has required time to even realize the existence of these difficulties, and many of them are not only not yet solved but not yet tackled. Probably the greatest drawback was the magnificent enthusiasm and optimism of its early days. This enthusiasm was bad in many ways; it kept the company blind to the difficulties and pitfalls, it prevented forethought, and it was of necessity followed by an almost disastrous reaction of disappointment and depression, through which the company was safely brought only by the tenacity of its larger shareholders. This is probably the common history of all mining enterprises. In these days things have come to such a pass that the public, even our best business men, will not go into a mining venture unless they are promised almost fabulous returns. This has bred a class of promoter over-rich in enthusiasm and optimism. We may take it as part of a normal course, almost an unavoidable course for every mining company to have its period of extreme depression. In the hands of the promoter the pendulum is at one extreme; as the true facts of the case begin to appear they will be accompanied by fears and doubts, and the pendulum will swing to the other extreme. Very often it will swing off the hooks altogether, but if the enterprise has real worth, tenacious shareholders may hold things together till they are reorganized on a normal basis.

But corundum in Ontario had more than the ordinary mine's share of troubles and difficulties, in fact there never was a clearer case of not being able to see the woods on account of the trees. There were so many difficulties in the details obscuring a view that it was next to impossible to see with clearness the general problem. An account of these difficulties and the efforts that were made to overcome them hardly belongs to the sphere of the present article.

Those in control of affairs at the start had to face new and unknown conditions in every part of their work. The nature of the deposit was wholly unknown; the problems of concentration were in many respects entirely new; the district, though in the centre of Ontario, was, from a miner's point of view, as isolated as the Sahara, the tributary labor supplies being entirely ignorant of mining and milling conditions. The demands of the market were unknown and the connection between the true demands of the market and the technical possibilities of milling conditions was wholly conjectural. Many different types of manufacturing concerns needed corundum, but they were not aware of the fact, and this called for missionary work of a distinctly pioneer character. After the missionary work was well started and people began to learn that they needed corundum, they did not know how to use it effectively, and this called for more missionary work of a different type. The directors were not mining men, and though they were prominent and successful business men, they were ignorant of mining conditions; they had never leant how completely local circumstances could alter cases; they had never suffered from the tyranny of local conditions. The problem called for scientific technical work of the highest degree. It called for an organization that would get high grade technical results from a most unsatisfactory untrained class of labor. It called for commercial acumen of a broad and far-seeing type; it called for business energy of the type that would not overlook the smallest detail. It is comparatively easy now to see some of the mistakes of the early days. Five men, as managers or superintendents with experience gained all over the world, have put their efforts into the solution of the problem, and they have left legacies of successful work as well as of mistakes. The mill itself is rather a remarkable legacy; it was designed by one man, the plans were altered by a second; the mill was built by a third, who left shortly before completion of construction, so that its early operation was conducted by a fourth. A fifth was called in to prepare plans for improvements and alterations, which plans were consigned to the care of a sixth to carry out, but they were altered by a seventh. In pioneer work we learn largely by mistakes; they are essential to progress. Probably the successful mining man is the amn who feels his way by his mistakes but is quick to see his mistakes and cut them short.

At the present day most of the difficulties arise out of the unsatisfactory labor supply. Though Craigmont is somewhere midway between Toronto and Ottawa, it is so far from the main avenues of travel that it remains in complete isolation. In the neighborhood of the mine there are several men and women who have never seen a railway train. The writer was driven from Craigmont to Barry's Bay last winter by a bright active boy of twenty, with a good country school education, who saw a locomotive for the first time that day. The local labor supply is small and very irregular, depending upon the season and the harvest, and the supply is kept up by importation, not quite so systematic or so coercive as in the Transvaal, but still containing all the unsatisfactory elements of labor importation. In these days of prosperity, Cobalt excitement, and cheap harvest excursions to the Northwest, the laborer is very independent and very restless. In the twenty months that the writer has had charge of the affairs at Craigmont, there have been on the books of the mill foremen 260 names. This is in the main part of the mill, where the full crews for both shifts consist of twenty-five men. Of these 260 men only two had ever seen a concentrator outside of Craigmont. In one month twenty-eight new men were taken into the mill, and the men in every position, including both foremen, were changed. Very few of the men are dismissed, the majority of them quitting of their own accord, chiefly through restlessness. Concentration is an art depending under ordinary conditions more upon the man behind the machine than upon the machine or the method. In the concentration of corundum not only is the problem rendered more difficult by the small difference

in specified gravity between the corundum and the waste minerals, but the finished product must be cleaner and of a more uniform standard than in any other branch of concentration. The obtaining of these results under the local conditions of Craigmont has called for the development of a method extreme in the direction of fool-proofness and in an organization designed principally to take care of and teach the new unskilled workmen. The hardness of the mineral to be saved and the habit of its fracture more than counterbalance the drawback of its low specific gravity. The absence of any differential surface tension action makes the cleaning of the slimes and finer sizes a difficult and wasteful process, but with all the coarser sizes the high grade of product is maintained without serious difficulty.

The problems of the selling department have also their intricate details; as an example, until very lately the publicity department has included in all its advertising literature the statement that the abrasive efficiency of emeries varies according to the percentage of corundum that they contain, and the inference has been made that because Craig mine corundum contains twice as much corundum as does a high grade emery it must be twice as good. This may be a partial truth, but has been a very serious fallacy, as it has not only emphasized the competition with emery but has largely governed (in the wrong direction) the selling price. In reality, though, both crystal corundum and emery owe their abrasive qualities to the corundum content, the percentage of corundum present has practically nothing to do with the relative efficiency. In the case of emery, most of the corundum is present as a delicate sponge-like skeleton filled in with iron axide. When this iron oxide is dissolved out by acid this skeleton shows to be granular and easily crumbled. In work it is supported by the iron oxide, but its action is a fine scratching rather than a cutting. With crystal corundum the working edge is a firm, hard, sharp edge that cuts cleanly without a sign of rubbing or scratching. Emery and corundum should not be considered as being in the same class of abrasives. This difference in the texture or mechanical character of the individual particle also had much to do with the hindering of the progress of corundum in its early days. The success of an abrasive wheel or an abrasive paper depends as much on the bond as on the abrasive. Emery, on account of its rough, almost porous, surface, is easily held by any bond or glue; corundum, on the other hand, on account of its smooth, dense surface, is much more difficult to hold, and as it takes a much harder bite on the metal it needs much more careful holding. The result was that many of the early products were most unsatisfactory because of the rapidity with which the corundum was pulled away from its bond. The excellent work done by some of the wheel manufacturers of the States have completely overcome this difficulty in the manufactured wheel, but in the polishing trade, where the individual factory or probably the individual workmen attaches the abrasive with ordinary glue to a soft wheel, this particular trouble has often condemned the use of corundum in favor of emery.

The main efforts at Craigmont to-day are directed towards increasing the capacity of the mill, the elimination of horneblende and garnet from the products supplied to the vitrified wheel makers, and the collecting of a nucleus of steady contented workmen trained to the special character of the work. Good progress is being made in each case. Beyond the elimination of the horneblende, no effort is being made to increase the purity of the output. The standards which have been adopted, and which are adhered to very closely, are accepted as being perfectly satisfactory by the most exacting wheel makers on the continent, and the reputation for uniformity of quality and steadiness of supply has been fully established. More than 300 men are now employed on the works.

THE PROFESSIONAL IDEALS OF THE TWENTIETH CENTURY

A Plea for the Higher Conception of the Engineer's Relation to Society.

(Arthur Twining Hadley—Dedication of the United Engineering Societies' Building.

The great element of progress in the nineteenth century has been the recognition on the part of mankind in general, of the value of scientific generalizations in very department of human conduct. Our science has become sounder, our understanding of its applications clearer, and the public has recognized that scientific conduct of a business means the substitution of universal experience, learned with difficulty and applied with toil, for the narrower range of individual experience which was at the disposal of the so-called practical men of fifty or one hundred years ago. Of this change the engineer is the representative and the leader. He it is that makes physical science in its various lines applicable to the complex problems of construction and development. He it is who has paved the way for the recognition of the technologist and the expert in every line of human industry. He it is who has shown how mathematics, instead of being an abstract discipline, remote from everyday human affairs, may become the means of applying truths for a long time remote and undiscovered, to the everyday affairs of the world in which we live. Not the buildings that you have built; not the railroads that you have planned; not the machines that you have invented, represent your greatest achievement. Yours is the proud boast of having in one brief century established science as the arbiter of the material affairs of mankind, and of having enforced her worship upon a world once reluctant but now gloriously admiring.

Well, then, you will ask: is there anything which remains to be done comparable in importance to this? Yes, there is. An equally large part—perhaps in one sense a much larger part—of your professional duty yet remains to be accomplished. It is not enough to have technical training. It is not enough to know the special sciences on which the practice of a profession is based. A man ought to have clear conceptions of the public service which his profession can render, and the public duty which its members owe. Thus, and thus only, can the engineer, the lawyer, the physician, or a member of any other learned profession, rise to the full dignity of his calling.

For there are two quite distinct qualities which must be combined in order to secure the best professional services; two quite distinct tests which work must meet in order to be pronounced first-class. One of these is the technical standard; the other, for want of better word, may be called the ethical standard. The man who wishes to build a good railroad must not only lay it out according to the rules of the surveyor's art, with proper curves and grades, and bridges which will not fall, but he must also have intelligent regard to the needs of the population, the safety of travel, and the many other factors which determine whether a railroad shall be a

work of public use or a source of industrial bickering and financial disaster. This combination of public and private demands is not peculiar to engineering. It can be illustrated in every other profession of importance. It is not enough for the lawyer to give advice which shall be technically sound, and which shall enable his clients to keep out of jail. He must learn to take a large view of the law as a means of public service instead of private gain. It is not enough for the physician to know how to cure specific diseases. He must know how to care for the larger problems of public health, and to use the resources of the community in a way to meet as fully as possible its sanitary needs.

This larger view of professional obligations is not so fully recognized as it should be. We have in the nineteenth century made so much progress in the technical training of doctors and lawyers and engineers that we sometimes forget that there is need of anything more than technical training. We have let the old idea of public leaderships, which was prominent in the minds of the great professional men of past centuries, give place to another and narrower ideal which is fully satisfied when a man has made himself a technical expert. Many a man of real eminence in his calling deliberately rejects the wider conception of professional duty which I have here indicated. Perhaps he recognizes the claims of public service; perhaps he does not, but in any event he believes that these claims rest upon him as a man rather than as an engineer or a lawyer. In his professional capacity he says he is hired not to tell what the law ought to be, but what it is; not to advise how a railroad can do the most public service, but how certain men with certain ideas of their own can best use the differential calculus to get these ideas carried out. This is perhaps the prevalent view of professional ethics today. I believe that it is a wrong view, which must menace not only the influence and standing of the professions themselves, but the general interests of the republic.

Mere technical achievement is not the thing that endures. Among the peoples of the ancient world, I suppose that there were no engineers equal to those of Egypt. Considering the means at their command, the things they did were very absolutely extraordinary. They did some things which, even with the means at our command, we can hardly duplicate. But they used their abilities in the service of a dominant priestly caste; and therefore, while their work fills us with admiration, it does not appeal to us as does the work of the Roman engineers a few centuries later, who built roads and aqueducts and bridges, and thus took the lead side by side with the Roman lawyers in establishing the basis of modern civilization. The roads and bridges of Rome, simple and straightforward as they are, constitute a more enduring monument to the Roman engineers than all the obelisks and pyramids that were ever erected.

A commonwealth like that of the United States is necessarily governed by public opinion. Courts may formulate this opinion. Legislatures may pass rules to give effect to it. Police may enforce its demands against the recalcitrant. But the governing power rests in the intelligent public opinion itself. When that opinion ceases to be intelligent and powerful, freedom becomes a mere name. Now, a serviceable public opinion of this kind can only be formed when intelligent people, technically trained for different lines of life, seriously try to find out how their work can be made to meet the public needs. They are the only ones who can do this well. If it is done by anyone else it will be done badly. If the lawyers as a class try to keep the law in line with the demands of intelligent public opinion, we can get good law. But if the lawyers are content to see the law perverted to private ends, and judges take refuge in technical construction of precedents, without full regard to the needs of the existing situation, legislatures will step in to create a chaos of conflicting laws which are worse than no law at all. In like manner, if our engineers get their own minds clear, and get the public mind clear, as to the political economy of the properties entrusted to their charge and the ethics of their management, they can forestall these conflicts which now threaten to break out at every moment. But if the members of a profession whose advice is necessary for a clear understanding and wise settlement of these problems retire from the field of action, the matter will be settled by those whose interests are more selfish and less far-sighted. There are three professions to-day which do not regard themselves as servants, but as masters—the financier, the journalist and the politician. If the engineer and the lawyer accept positions as servants, simply putting their technical knowledge at the disposal of merchant, journalist or politician who will pay the highest price for it, it is not simply a confession of inferiority, it is a dereliction of public duty.

GAS POWER

In a series of articles on gas power, contributed to the magazine *Power*, Mr. F. E. Junge has dealt with gas engine practice in Europe and America, and has elaborated the conditions under which it has been retarded in America. Estimating the aggregate power developed in the United States at 14,465,000 h.p., of which 10,664,560 were developed from steam and only about 300,000 from gas, and taking the average price of coal at $2 per tone, Mr. Junge figures that of the 100,000,000 tons consumed for power purposes, at least one-half could have been saved by the adoption of gas generation. On this basis an annual saving of $100,000,000 could be effected.

"There should," writes Mr. Junge, "be more treatises to appeal to the interests of wider industrial and commercial circles, demonstrating the possibilities and clarifying the limitations of the application of gas power in the varied industries." Continuing, he attributes the scarcity of good literature on the subject to the fact that those men who are best qualified to discuss and write upon gas engineering, are prevented by the firms controlling their services from making public such data as would be of practical us to the working engineer. This spirit of commercial secrecy compares but poorly with the liberal attitude obtaining in other contries.

"But here is where this special trouble is wedded to the lamentable plague of commercialized engineering which is threatening us to-day in all progressive countries: Monopoly, the great discourager of effort in trade, manufacture and profusion, will dictate the technical methods to be followed, thereby suppressing individual aspirations; few great corporations will buy up the highest grade of skilled talent, literary, inventive, mechanical, but will keep it latent or at least barren of creative work, by raising almost insuperable barriers to the propagation of the fruits of its labor . . . It is hoped that the vastness and multiplicity of interests involved in the gas power field will effectively prevent centralization of the kind that precludes a stable and healthy industrial growth."

ANNUAL REPORT OF MINISTER OF MINES FOR BRITISH COLUMBIA

The annual report of the Minister of Mines for British Columbia for the year 1906 has been published. It is later than usual, the Bureau of Mines for that Province having previously for several years been able to distribute its annual report a month to two months earlier than this year. The delay has been occasioned by the press of work in the Privincial Government Printing Office, which for some time past has had its work greatly increased by the very considerable enlargement of the official *Gazette*

The report under notice is similar in size and general character to those issued by the Mines Department for a number of years. Its statistics of quantity and value of mineral production show the output of 1906—which was a record year as regards both quantity and total value of the mineral products—and, too, for purposes of comparison, that of all years from the time production was commenced in the Province. These tables have been carefully prepared and arranged in such form as to clearly convey information relative to the steady expansion of the mineral industry of British Columbia from the time it was of comparatively small proportions until now, when its total for the year of approximately $25,000,000 is about 31 per cent. of the mineral production, metalliferous and non-metalliferous, of the whole Dominion in 1906.

The reports of gold commissioners and mining recorders appear to have been reduced to what is of general interest concerning their respective districts. Those of other district officials in like manner have been kept within reasonable limits. The special reports of the Provincial Mineralogist and Provincial Assayer are properly of greater length. That of the Provincial Mineralogist, descriptive of his exploratory trip through the Peace River country, dealing as it does with an extensive region that it may be expected will within two or three years be thrown open for settlement, is of particular value and interest and will doubtless be widely read. The numerous illustrations of places and scenes in that outlying country enhance the value of the report and serve as useful object lessons to those desirous of learning something of the big new district in Northeastern British Columbia that will probably become settled ere many years pass.

A new feature in the report is the list of metalliferous mines shipping in 1906. Arranged according to districts, and showing location, name and address of agent or owner, and the class of ore produced by the numerous shipping mines, this list will be useful to many. It has been prepared following the frequent receipt by the Bureau of Mines of applications for information of this nature.

The half-tone reproductions of photographs merit especial commendation. The excellent work of Mr. Wm. H. Clark, foreman of the Government Printing Office pressroom, has again given very creditable results in this connection. Diagrams, maps, etc., have also been effectively used for purposes of illustration. A comprehensive index completes the report, which, as in former years, has been prepared under the direction of Mr. Wm. Fleet Robertson, Provincial Mineralogist.

Some of the statistical tables, with official comments thereon, follow:—

TABLE I.—TOTAL PRODUCTION FOR ALL YEARS TO 1906, INCLUSIVE.

Gold, placer	$ 68,721,103
Gold, lode	41,015,697
Total gold	$109,736,800
Silver	25,586,008
Lead	17,625,739
Copper	35,546,578
Coal and coke	79,334,798
Building stone, bricks, etc.	5,543,700
Other metals	270,099
Total production, all years.	$273,643,722

This table shows the total gross value of each mineral product that has been mined in the Province up to the end of 1906. From this it will be seen that coal mining has produced more than any other separate class of mining—a total of $79,334,798—followed next in importance by placer gold at $68,721,103, and third by lode gold at $41,015,697. The metal gold, derived from both placer and lode mining, amounts to $109,736,800, the greatest amount derived from any one metal or mineral, the next most important year being copper, of a total gross value of $35,546,578, followed by silver at $25,586,008, and lead at $17,625,739.

TABLE II.—PRODUCTION FOR EACH YEAR FROM 1890 TO 1906 (INCLUSIVE).

1852 to 1890 (inclusive	$ 71,981,634
1890	2,608,803
1891	3,521,102
1892	2,978,530
1893	3,588,413
1894	4,225,717
1895	5,643,042
1896	7,507,950
1897	10,455,268
1898	10,906,861
1890	12,393,131
1900	16,344,751
1901	20,086,780
1902	17,486,550
1903	17,495,954
1904	18,977,359
1905	22,461,325
1906	24,980,546
Total production, all years.	$273,643,722

This table shows the values of the total production of the mines of the Province for each year from 1890 to 1906, during which period the output has increased nearly tenfold, having reached a production for the year past valued at $24,980,546, or more than double what it was in 1899.

TABLE IV.—AMOUNT AND VALUE OF MINERAL PRODUCTS FOR 1904, 1905 & 1906

MINERAL	Custom'ry Measure	1904		1905		1906	
		Quantity	Value	Quantity	Value	Quantity	Value
Gold, placer	Ounces	55,765	$ 1,115,300	48,465	$ 969,300	.....	$ 948,400
Gold, lode.....	"	222,042	5,589,608	238,660	4,933,102	224,027	4,630,639
Total Gold.			$ 5,704,908		$ 5,902,402		$ 5,579,039
Silver	Ounces	3,222,481	$ 1,719,516	3,439,417	$ 1,971,818	2,990,262	$ 1,897,340
Lead.....	Pounds	36,646,244	1,421,874	57,580,703	2,399,022	52,408,227	2,667,578
Copper	"	35,701,128	4,578,037	37,692,251	5,876,222	42,990,488	8,288,565
Zinc	Tons	.....	.....	9,413	139,200	654	17,100
Total metalliferous			$13,424,335		$16,288,664		$18,449,602
Coal	Tons	1,253,628	$ 3 760,884	1,384,312	$ 4,152 936	1,517,303	4,551,900
Coke	2,240 lbs.	238,428	1,192,140	271,785	1,358,925	199,227	996,135
Other materials .	"	.....	600,000	.....	660,800	.....	982,900
Total production		.....	$18,977,359	....	$22,461.325	.....	$24,980,546

This table gives the amounts, in the customary units of measure, and the values, of the various metals and other minerals which go to make up the grand total of the mineral production of the Province for 1906, and also for purposes of comparison, similar data for the two immediately preceding years.

The table shows that in 1906, as compared with 1905, there was a decrease in the production of placer gold of some $20,900 and of lode gold $302,463, making for this metal a total decrease of $323,363.

The amount of silver produced in 1906 was 2,990,262 ounces, having a gross value of $1,897,320, a decrease from 1905 of $74,498, due chiefly to the decreased production of the Slocan district.

The table also shows an output of lead in 1906 amounting to 52,408,217 pounds, valued at $2,667,578, which, although a decrease from the production of the last preceding year of 4,172,480 pounds, is still greater than that of any other year since 1900, but owing to the greatly increased market value of the metal, and in spite of the materially decreased amount produced, the value of the product for 1906 shows an increase over that of 1905 of $268,556.

TABLE V.—PRODUCTION OF MINERAL BY DISTRICTS AND DIVISIONS.

NAME	DIVISIONS			DISTRICTS		
	1904	1905	1906	1904	1905	1906
CARIBOO DISTRICT	.....	.....	.....	$ 474,600	$ 406,000	$ 405,400
Cariboo mining division	$ 313,000	$ 300,000	$ 355,800			
Quesnel mining division	150,000	96,000	39.000			
Omineca mining division	11,600	10,000	10,000			
CASSIAR DISTRICT	.....	.....	.....	558,573	504,372	556,599
EAST KOOTENAY DISTRICT	.....	.....	.....	3,210,573	5,339,154	5,171,024
WEST KOOTENAY DISTRICT	.....	.....	.....	5,806,070	5,421.859	4,660,352
Ainsworth mining division.....	168,023	100,273	268,111			
Nelson mining division.....	466,683	532,564	515,709			
Slocan mining division	1,236.858	970,344	532,228			
Trail Creek mining division	3,760,866	3,672,878	3,213,587			
Other parts.....	173,640	145.650	120,717			
LILLOOET DISTRICT.....	.....	.....	... .	34,583	32,584	20,314
VALE DISTRICT.....	....	.....	.....	4,190,291	6,483,504	8,779,711
Osoyoos, Grand Forks and Greenwood divisions	4.110,366	6.356,410	8,698,470			
Similkameen division.....	2,500	1,533	2,624			
Yale division	77,415	125,461	78,617			
COAST DISTRICTS (Nanaino, Alberni, Clayoquot, Quatsino, Victoria)	....	.....	....	4,702,679	4,273,852	5,388,146
				$18,977,359	$22,461,325	$24,980,546

Table V. shows the proportions of the total mineral production made in each of the various districts into which the Province is divided. It will be noted that in 1906 the Boundary (Yale) district again has the honor of first place, followed in order of output by the Coast district and East Kootenay, with West Kootenay, for many years the Province's greatest producer, only fourth on the list. The Coast and East Kootenay districts, however, owe a considerable percentage of their outputs to the coal mines situated within their limits, whereas in the other districts the production is entirely from lode mining.

The official comment on other tables published in the report is as follows:—

Table VI., Yield of Placer Gold to Date, gives the statistical record of the placer mines of the Province from 1858 to 1906, and shows a total production of $68,-721,10. The output for 1906 was $948,400—a decrease of about two per cent. as compared with 1905, due to a dry season with a shortage of water for hydraulic mining.

Table VII., Production of Lode Mines, relates entirely to the lode mines of the Province, and shows the amounts and values of the various metals produced each year since 1887—the beginning of such mining in the Province. The gross value of the product of these mines is $119,774,022. The production in 1906 was $17,484,102, an increase over the last preceding year of $2,303,933, or about 15.2 per cent.

Table VII., Coal and Coke Production per Year to Date, contains the statistics of production of the coal mines of the Province. The total amount of coal mined to the end of 1906 is 24,144,633 tons (2,240 lbs.), valued at $72,815,423. Of this there was produced in 1906 1,517,303 tons, valued at $4,551,909, a larger amount than had been produced in any previous year. In these coal production figures the coal used in making coke is not included, as such coal is accounted for in figures of output of coke.

The amount of coal used in making coke in 1906 was 381,773 tons, from which was produced some 199,227 tons of coke, worth $996,135, a decrease of some 72,558 tons from the total of coke produced in 1905. These figures are to a certain extent misleading, however, as in 1905 some 3,694 tons of coke were put into stock, whereas in 1906 all the coke made was sold, together with 11,670 tons taken from stock, making the total coke sales for the latter year 210,897 tons. The production of coke in 1906 would have been much greater than it was but for the very urgent demand for coal and the general scarcity of labor, which taxed the companies' resources to keep up a sufficient supply of coal. A strike at the Crow's Nest Pass collieries in the autumn also greatly diminished the output.

Table IX., Production of the Metalliferous Mines, gives the details of production of the mines of the Province (excepting coal mines) for the years 1903, 1904, 1905 and 1906, and the districts in which such productions were made, showing the tonnage of ore mined in each district with its metallic contents and market value. The total tonage of ore mined in the Province during 1906 was 1,963,872 tons, having a gross value of $19,432,502.

The following table shows the percentages of such tonnage and values derived from the various districts of the Province:—

	Tonnage, Per cent.	Values, Per cent.
Boundary (Yale) district ...	60.2	44.2
Trail Creek (Rossland) mining division	14.2	16.3
Fort Steel (East Kootenay) mining division	9.2	15.1
Slocan district	0.8	2.7
Coast district	11.1	6.5
Miscellaneous and other districts	4.5	15.2
	100.0	100.0

Table X., Comparative Mineral Production, compares graphically the output of mineral products in British Columbia with that of similar products in all the other Provinces of the Dominion, and shows that in 1906 British Columbia produced of the metals an amount over 757. of that of all the other Canadian Provinces combined.

VEIN FORMATION AT COBALT, ONTARIO

By J. B. Tyrrell, Mining Engineer, Toronto, Ont.

At the meeting of the Canadian Mining Institute, held in Toronto last spring, Dr. C. R. Van Hise, of Madison, Wisconsin, delivered an instructive address on "The Ore Deposits of the Cobalt District," in which he emphasized the facts already pointed out by Messrs. Campbell, Knight, and others, that there is a distinct and regular sequence in the order of segregation of the various ores in the veins, the cobalt and nickel ores being segregated out first, while the silver ores were introduced at a later date.

Speaking of the silver ores, and of the probability that they again might have been introduced at two separate and distinct periods of time, he said: "To what extent are the rich deposits the result of one segregation under comparatively deep-seated conditions, and to what extent of two segregations, one under deep-seated and the other under shallow conditions? Did the shattering which resulted in the entrance of the silver solutions occur under deep-seated conditions, so that the silver of the rich shoots was deposited as a closing episode of practically one continuous period of concentration? Or, after the first concentration was complete, did the shattering then occur, and the later enrichment take place under comparatively shallow conditions, the two periods of concentration being separated by a long interval? Whatever is the final answer to the above question, it appears certain that the extremely rich superficial deposits of a few feet in thickness, connected directly with the zone of weathering, are due to secondary concentration under surface conditions. I refer to the nugget horizon, which is so rich in silver, and in which the smaltite and cobaltite have been largely altered into secondary minerals, or have been leached out altogether. It is practically certain that this extraordinarily rich upper film in the Cobalt district has been produced by two concentrations, one under deep-seated

conditions, when atmospheric waters were not present, and the other under surface conditions, when atmospheric waters were present."

Again, "I believe that the extremely rich upper silver belt, so characteristic of the district, is unquestionably the result of two concentrations, the latter of which is accomplished through the agency of atmospheric waters."

Thus two distinct periods of time are here clearly

designated for the deposition of the silver ores, namely, an earlier one under deep-seated conditions away from the presence of atmospheric influences, and a later one under surface conditions, though both of these segregrations are secondary as compared to the prior segregration of the cobalt and nickel ores.

Dr. Van Hise also agrees with Professor Miller and others that the post-Huronian diabase which is known to underlie large areas within the district is the original source of the ore, and also that this diabase has the form of a horizontal sill or laccolith, rather than of a series of huge dikes or batholitic masses which spread out and increase in size as they descend, and that it rose through fissures or vents in the older rocks of Keewatin, Laurentian or Huronian age, until it reached and was stopped by some more resistant layer, through which it was unable to penetrate, and so was forced to spread out horizontally beneath it.

Professor Miller has also shown, in a paper published in the first number of this JOURNAL, that the mineral-bearing veins "appear to have been formed when the cooling of the diabase was taking place. On cooling, the diabase would contract, producing fissures, not only in its own mass, but also in the rocks with which it was in contact, or which lay adjacent to it."

It will be interesting to consider some of the effects on the form and richness of the mineral-bearing veins of the Cobalt district which would seem to follow as natural and logical results from the conditions outlined above. If the conclusions here reached do not harmonize with the conditions that may be found to occur in the mines by the managers and superintendents who are operating them, any corrections and emendations will be gladly welcomed.

At the time when the laccolith was being formed the molten diabase, after rising for a certain distance through the older and already consolidated rocks, would seem to have met a more resistant layer which obliged it to spread out horizontally along planes of weakness in these rocks and form extensive flat-lying sheets. By the injection of this fluid sheet or lens the superincumbent rock was raised to a certain extent.

The liquid diabase was, of course, very hot, and the heat from it was communicated to the rocks above and below it, and these in their turn would expand with the increase in temperature, but on account of difference in texture and composition the heat would be absorbed differently by different bands, and the expansion would consequently be unequal, so that joints, fissures and shearing planes would be formed.

After the intrusion of the diabase had ceased, it would gradually begin to cool and harden. As it cooled it would contract, and fissures would form in the parts that had consolidated, but while there was any portion of the mass still fluid these fissures would probably be filled from the fluid interior. The fissures occupied by the present veins were therefore formed subsequent to the solidification of the whole mass

After the mass had solidified, as it and the adjoining rocks gradually cooled they would necessarily contract, the contraction amounting to about 9 inches in 1,000 linear feet for every decrease of 100 degrees centigrade in temperature. This contraction would cause the formation of many irregular fissures normal to the plane of heating and cooling, or in this instance approximately vertical. The fissure would be widest and most extensive either in the diabase itself, or in the surrounding rock wherever this was in immediate contact with the diabase, where the heat had been most intense, and where the subsequent cooling and consequent shrinkage was also greatest.

The rock above the laccolith, extending from it to the surface of the earth, would lose its heat and cool comparatively quickly, and on this account it is hardly probable that it became very hot to any great distance from the diabase. Therefore the cracks and fissures wards more or less at right angles to it, would all be short and very shallow. They would, of course, be that were formed by contraction on cooling in the thin heated layer near the diabase, and that extended out-

widest close to the diabase where the heat and subsequent decrease in temperature had been greatest, and would quickly contract and disappear altogether at a short distance from it. If mineral-bearing solutions in ascending from the heated interior of the earth reached this zone, the fissures were probably filled by such minerals as are known to have been deposited first throughout the district, such as calcite, smaltite, cobaltite, niccolite, etc., but the silver ores, which are

here the products of a later segregation, would probably be absent.

The rocks that underlay the diabase, whether Keewatin greenstone, Laurentian granite or Huronian conglomerate, would be heated by it like the rocks above it, but as the cooling took place largely by radiation of heat from the surface of the earth, and as the laccolith now lay between these underlying rocks and the surface, the cooling would progress exceedingly slowly, in fact it would not begin at all until the laccolith itself had cooled to the temperature of the rock below it. Then this lower rock would begin to cool and shrink, and as the shrinking continued numerous fissures would be formed, which in the aggregate would certainly be widest and most extensive close to the contact with the overlying diabase, and would pinch out and disappear as they descended, or as they went farther and farther from the diabase.

To what depth the rock was affected by the heat from the diabase and by its subsequent cooling is not known, but it will be a matter of great interest to determine, as the fissures occupied by the veins may be expected to extend to that depth.

As clearly shown by Dr. Van Hise, the fissures so

formed in this zone of shrinkage were first filled by calcite and ores of cobalt and nickel by precipitation or deposition from solutions that had risen from deep-seated sources during the later stages of the diabase eruption, and had circulated outwards through cracks and crevices as far as the influence of the diabase intrusion had reached. These minerals now make up very much the largest part of the contents of the veins, so that the veins were formed almost to their present size, and the walls were almost as far apart as they are now, and consequently the adjoining rock had cooled almost to its present temperature, while this early stage of ore deposition was in progress.

As an accompaniment to the very last stages of the diabase instrusion, silver-bearing solutions rose from deep-seated sources along the igneous vents and spread through and under the mushroom-shaped laccolith along the fissures and veins as these widened slightly with the final cooling and shrinking of the rock, the process being continued until all the channels for the passage of the rising waters were choked.

The veins thus fill V-shaped fissures which extend downwards unknown distances below the bottom of the laccolith, or the former position of the laccolith, and in the aggregate become narrower as they go down.

In applying this rule, however, it should be observed that any individual fissure may be only a part of a complex imbricated series, so that while one may contract, another to one side or the other of it may widen to an almost corresponding degree. The rapid pinching out of one vein in depth should not, therefore, lead to the belief that the bottom of the zone of shrinkage had been reached, but should rather lead to exploration for other so-called "blind veins" in the vicinity.

After the veins had thus been formed by segregation from waters of magmatic, or at all events of deep-seated origin, there was a very long period of time during which the earth's surface was here subjected to the influence of atmospheric agencies, and was gradually eroded away. Much of the rock which originally covered the diabase laccolith was thus removed, and doubtless large blocks of the diabase itself were also worn away, uncovering the rocks which underlay it over areas of unknown extent. At the same time many veins holding ores of cobalt and silver were cut into, and exposed to meteoric influences, so that the oxygenated surface waters percolated downwards into them, and leached the silver from their decomposed uppermost portions, redepositing it a little lower down near the zone of groundwater. This process went on continuously as the surface was gradually removed, and the level of groundwater was lowered, and in this way an abnormally rich zone was constantly present in the veins a short distance below the surface. This is the later "secondary enrichment" spoken of by Dr. Van Hise.

As the long period of denudation was drawing to a close, during which erosion, solution and concentration had been almost constantly at work, the Glacial period set in. A vast sheet of snow and ice then moved southward across the country, and cleaned off and swept away the decomposed rock that for long previous ages had everywhere formed the uppermost layer of the surface of the land, and left the greatly enriched parts of some of the veins either exposed to view, or merely covered by a thin layer of boulder clay.

In summing up the evidence, more especially in regard to the veins in the conglomerate and other rocks beneath the diabase, it would thus appear:—

That these cobalt and silver veins were formed in V-shaped fissures which taper from above downwards;

That though they were formed by mineral-bearing waters which rose from deep-seated sources, and were associated with the latest stages of the eruption of diabase, having probably risen through the same vents with it, these waters spread out laterally through cracks and openings in the mushroom-shaped top of the laccolith of diabase, and descended into the fissures in the rocks beneath it;

That thus the veins were originally formed by deposition from waters which locally descended from above, rather than ascended from below, as in most normal veins;

And finally that the veins were superficially enriched at a later period by atmospheric waters descending through portions of the veins which have since been eroded away.

TORONTO MEETING OF THE AMERICAN INSTITUTE OF MINING ENGINEERS

The proceedings of the Institute were formally opened on Tuesday afternoon, July 23rd, in the banquet hall of the King Edward Hotel. The delegates were met at the station by a reception committee consisting of Dr. W. G. Miller, Mr. J. B. Tyrrell, Mr. O. N. Scott and Mr. J. C. Murray.

At the afternoon session Mr. John Hays Hammond, the president, occupied the chair. In the absence of His Worship, Mayor Coatsworth, Alderman J. J. Graham read a brief address of welcome.

The secretary of the Institute, Dr. R. W. Raymond, was presented with a portrait of himself. This mark of appreciation was contributed to by members of the Institute from all quarters of the globe. Dr. James Douglas made the presentation. His speech was singularly happy. Dr. Raymond replied in a brief but most characteristically felicitous speech.

It was then announced by the secretary that Dr. Charles D. Wolcott, late Director of the United States Geological Survey, and now secretary of the Smithsonian Institute, had been unanimously elected an honorary member of the American Institute of Mining Engineers.

Papers were read by Professor W. P. Blake, on "The Destruction of the Salt Industry at Salton Lake, California," and by Dr. James Douglas, on "Some Reflections on Secrecy in the Arts."

In the evening a reception was held at the Parliament Buildings. The Hon. Mr. Cochrane occupied the chair, and Chief Justice Moss, Acting Lieutenant-Governor, welcomed the visitors on behalf of the Province of Ontario. The Hon. Mr. Foy, Acting Premier, also spoke briefly. Mr. John Hays Hammond, in an incisive and brilliant reply to the welcome, spoke appreciatively of Canadian mining engineers. Dr. R. W. Raymond and Dr. James also spoke. Refreshments were then served in the west wing of the building.

Wednesday's proceedings consisted in the reading of several papers. The ladies of the Institute were taken for a tour of inspection by the civic authorities. In the evening the whole party left for Cobalt.

As these meetings are being held just as THE CANADIAN MINING JOURNAL is going to press, it is impossible to give a full account of the proceedings. In our issue of August 15th we shall, however, publish a full and accurate account of all the meetings, both in Toronto and elsewhere.

It is noteworthy that never before has Toronto been visited by such a body of distinguished mining men. The Provincial authorities and the City Council, fully realizing the importance of the occasion, have spared no effort to make the visit of the American Institute of Mining Engineers a memorable one. The tone of all the meetings has been high, as is to be expected from a society whose officers are men of such lofty attainments and ideals. The series of meetings, entirely apart from the commercial aspect of their advertising value, will do much to educate the mining men of this Province.

ELECTRO METALLURGY

At the recent meeting of the Engineering Conference of the Institution of Civil Engineers, in Great Britain, the subject of the progress of electro-metallurgy was very ably discussed in a paper presented by Mr. Bertram Blount, A.I.C.E. After referring to the recent improvement in methods, it is pointed out that the subject of electro-metallurgy was not so long ago so special that few were able to judge whether a process was likely to be successful or not. Now, however, it is being studied like any other branch of chemical engineering, its principles are well understood, and the result is that processes which may be of considerable laboratory interest, but are plainly unworkable commercially, are disregarded, and the energy and money formerly wasted on these are directed to those which may be made a commercial success. The principal electro-metallurgical industries at present are, the author states, the refining of copper, the greater part of the world's output being refined electrolytically, and the manufacture of aluminum, of sodium and of steel. The latter, it is opined, will eventually become the largest of all electro-metallurgical industries; but, at present, only a beginning has been made in the development of suitable methods. We quote the following paragraph from the paper itself: "Much delay in arriving at the present status has occurred because for years inventors tried to smelt iron instead of manufacturing steel from iron already smelted in the blast furnace. Now, however, attention is turned to steel-making as a more easily attainable end, with the results that already steels of high grade can be successfully prepared in electric furnaces of various type—the Heroult and the Kjellin representing two of the most distinctive and promising. Probably, in the first instance, the electrical method will have its greatest measure of success in preparing steels of such high grade that any extra cost will be quite outweighed by the certainty that the metal will absorb no impurity in the course of manufacture. But as methods are cheapened it may well be that every grade of steel now prepared in open hearth furnaces will be prepared in corresponding furnaces electrically heated. The power necessary should be obtainable from blast furnace gases, for after a liberal allowance for heating the blast and for the blowing engines, hoists and subsidiary gear, there is certainly an ample surplus, provided modern power plant is installed."

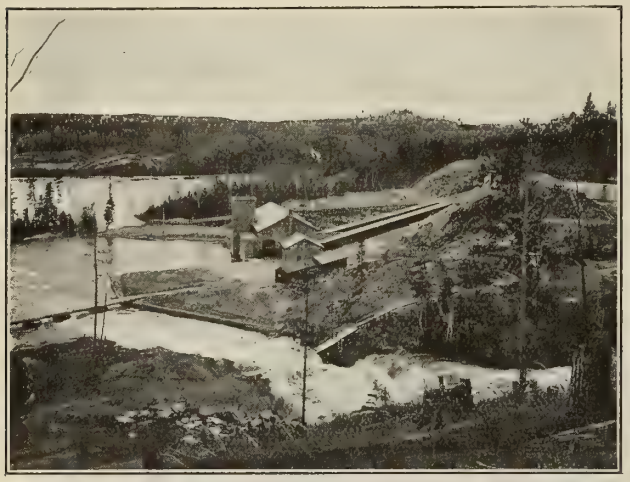
Another author of a paper read at the meeting refers to the electro-metallurgical experiments carried out in Canada under Government auspices, and states that three important points have been decided thereby: (1) that charcoal, even of inferior quality, can be satisfactorily used in the electric furnace without briquetting; (2) that ores containing a considerable percentage of sulphur and practically no manganese can be used to produce low sulphur pig iron; and (3) that magnetite offers no special difficulties for treatment by this method.

THE MINING AND SMELTING EQUIPMENT OF THE CANADIAN COPPER COMPANY.

By David H. Browne.

The last three years have been, for the Canadian Copper Company, a period of transition. In 1902, when this company was absorbed by the International Nickel Company, the smelting plant at Copper Cliff consisted of two furnace buildings, which had grown by accretions and additions, covering a number of small Hereshoff furnaces, all of which were fed by hand, and each was independent of the others. These furnaces produced a matte containing from 30 to 40 per cent. of copper-nickel, which was shipped a mile away to an auxiliary company, known as the Ontario Smelting Works. Here the matte was ground in a ball mill, roasted in long calcining furnaces, briquetted and smelted in brick cupolas to a matte containing from five to eight per cent. of iron.

Creighton Mine—Open Pit.



This procedure, as might be expected, was inefficient, and it was decided to consolidate the furnace work and the refining in one plant and to go back to the Bessemer process, which had been formerly used. Consequently, in 1903, a new furnace building was erected, and two modern furnaces 50 x 204 inches were installed. The matte from these furnaces was blown up to 80 per cent. copper-nickel in the same building in three converter stands. All this equipment was steam driven. In 1904 it was decided to make use of the water power on the Spanish River, owned by the Huronian Company, and in that year Messrs. Ross & Holgate, of Montreal, took charge of the construction of the dams and the installation of the machinery to generate the power required and to transmit it to the smelter at Copper Cliff.

The High Falls of the Spanish River is about four miles north of the town of Nairn, on the Soo branch of the Canadian Pacific Railway, and about 25 miles from Copper Cliff. In the spring of 1904 a railway was constructed from the Canadian Pacific Railway to the falls, and a camp was erected for the workmen. This preliminary work was done during the summer of 1904, and the construction of the dams and power house was begun in the fall of that year. The Spanish River at this point flows in two channels around a high, rocky island, about 2,000 feet long by 900 feet wide, falling about 65 feet in its passage. As this island rises some 75 feet above the upper level of the river, the engineers found it advisable to make use of this island as part of their system of dams, cutting out a large forebay at one side of the island and so gaining a total head of about 85 feet between the upper and lower water levels. This construction was also advisable in order to drown out a series of rapids which obstructed the river above the falls. The raising of the water twenty feet by this construction forms a storage basin about six miles long, and avoids the danger of "frazil" or mushy ice, which forms in the neighborhood of rapids.

Work on the dams was carried on throughout the winter of 1904-5, in weather sometimes as low as 30 below zero. Some very interesting problems were met by

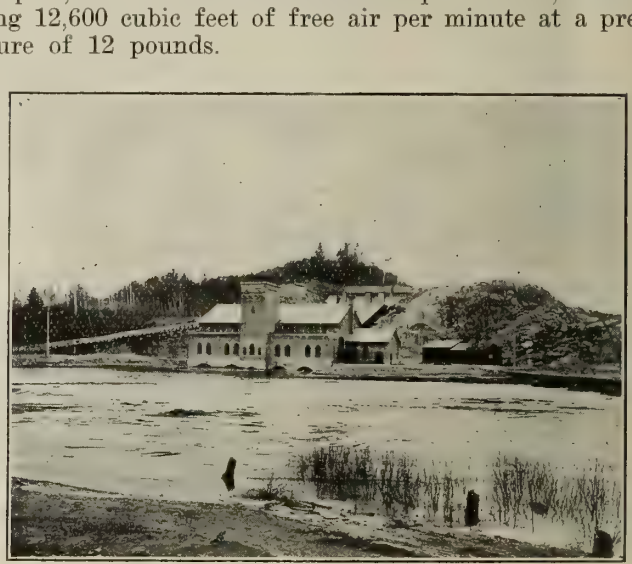
Messrs. Ross & Holgate, and their solutions of these is told in a paper read at the meeting of the Canadian Institute of Civil Engineers, in April, 1907, from which the following passage is quoted:—

"Though a large part of the concrete work in dams and also in the power house foundations was done in winter, no difficulty was found in securing good concrete work, the only precaution taken being to heat the mixing water by turning a three-quarter inch steam pipe into the barrel supplying the mixer, and during the process of mixing to use a jet of live steam in the mixer,

High Falls Power House

keeping the cylinder closed by wooden coverings during the process of mixing. No attempt was made to heat sand, or stone, nor was such at all necessary. In all the winter work care was taken to use only cement which would attain its initial set in not more than sixty-five minutes, and the results obtained have been absolutely satisfactory."

The power house at High Falls is a concrete and brick building 106 feet long and 55 feet wide in the main, with an extension along one side 24 feet wide containing the transformers and a wing 35 feet square at one end containing a storehouse and heating plant. In this building provision is made for four penstocks 9 feet in diameter, through which water enters to the turbines at a maximum speed of 7.2 feet per second. Two turbines are at present in operation, and a third will be installed during the summer of 1907. These turbines, made by the I. P. Morris Company, of Philadelphia, are designed for a maximum of 3,350 horse-power each. Direct connected with each turbine is a 2,000 kilowatt generator, made by the Crocker-Wheeler Company.



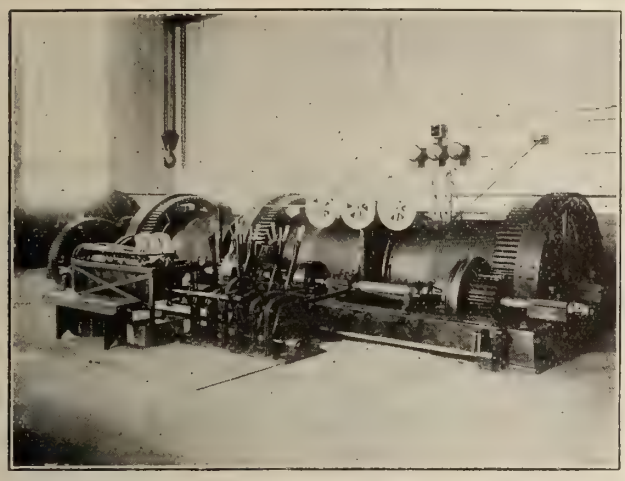
The effective head of water is 85 feet, and the speed of the turbines and generators is 375 revolutions per minute. These generators produce 2,000 kw. current at 2,400 volts, 3-phase, and 25 cycles. Space is provided in the power house for four such units, two of which were put in operation in February, 1906, and the third is at present under construction, leaving the fourth for future installation. When these generators were completed one was tested against the other by reversing the direction of rotation of the second and using it for a time as a turbine pump operating against the full head of water. In this way each machine was tested under varying brake loads.

The switchboard, installed by the Westinghouse Company, occupies a sloping marble table in front of the operator, on a platform about ten feet above the floor. In front of this table are pillars carrying the necessary volt and ammeters, and other recording instruments, so that the whole output of the machine is recorded in front of the operator.

Two groups of three transformers are at present installed in the transformer chamber behind the switchboard. These raise the pressure to 35,000 volts, at which tension it passes through the tower to the transmission line.

This line follows the Soo branch of the C. P. R., on a private right of way, and owing to the necessary curves, is about 29 miles in length. It consists of two three-phase circuits of No. 1 wire, supported on a cross-arm on and between two poles. But one line is in operation at a time, provision being made for throwing the load from one to the other line in case of accident or repair. The insulators were tested at the start at 70,000 volts, and the transmission has given no trouble except in two or three cases where the insulators have been accidentally or maliciously broken.

At Copper Cliff this transmission line enters the sub-station, a concrete building 203 feet by 100 feet, and is there stepped down to a proper voltage for the various electric motors. In this sub-station are installed three Nordberg radial valve blowing engines, while a fourth similar engine is being constructed at present. These engines are rope driven by Allis-Chalmers-Bullock induction motors of 600 horse-power working at 2,200 volts. These motors are arranged to work at three speeds, so that the volume of air delivered to the furnace is under control. The engines are duplex, 42 inch stroke, 70 inch piston diameter, and deliver 320 cubic feet of free air per revolution. The blast for the Bessemer converters is furnished by a Nordberg blowing engine, rope driven by an Allis-Chalmers-Bullock 500 horse-power induction mo- for running at a constant speed of 375 revolutions per minute. This blower is 36 inch stroke, 40 inch diameter, duplex, and runs at 100 revolutions per minute, delivering 12,600 cubic feet of free air per minute at a pressure of 12 pounds.



Power House at Crean Hill.

For air hoist on furnace doors, for running drills, and for similar mechanical work, a 100 lb. air compressor, made by the Laidlaw-Dunn-Gordon Company, is provided. This is 25 inch stroke, 15 inch diameter on the high pressure cylinder, and 24 inch diameter on the low pressure side, and is direct connected to an Allis-Chalmers-Bullock induction motor of 300 horse-power, running 125 revolutions per minute at 2,200 volts. The motive power for the electric locomotives which take the trains of ore from the ore bins to the furnaces is furnished by

one 40 kw. motor generator set which takes 550 volts, 40 amperes, alternating current, and delivers 250 volts, 100 amperes, direct current.

The alternating current arc lighting system used for street lamps is supplied by a 75 kw. frequency changer set, in which the 25 cycle current from the transformers is changed to 60 cycles, as required by the arc lamps.

The blast from the three Nordberg air compressors is carried through 36 inch pipes on an overhead system of supports to the furnace building, which adjoins the sub-station. The furnace building is 357 feet long and 85

Interior Crean Hill Engine House—Hoisting Plant.

feet wide. It covers at present three cupola furnaces, four converter stands, and the relining platform, but these converter stands and their lining machinery are in this building merely as a temporary expedient during the erection of the main converter building. The furnace building is designed to cover five cupolas, of which two have been in operation since July, 1904, and the third has been in blast since April, 1906, and two more are under construction. These cupolas stand in a row down the centre of the building, having on one side two standard gauge tracks for the disposal of furnace slag, and on the other side a 32 foot crane span, on which two 50 ton cranes attend to the handling of furnace matte to the converters and of Bessemer matte from the converters to the casting moulds.

The platform on which stand the settlers is 10 feet above the floor of the smelter building. On this rise the concrete bases of the furnaces, so that the hearth plates of the furnaces are 6 feet 6 inches above the tapping platform. The furnaces are 50 inches by 204 inches at the tuyeres, and consist of two tiers of water jackets, the lower or tuyere jackets being 8 feet 6 inches and the upper or top jackets being 6 feet in height. The total height from the lower floor of the furnace building to the charging floor is 35 feet, and the total jacket height of the furnaces is 14 feet 6 inches.

Each of the tuyere jackets contains four six inch tuyeres, which are bushed down to four inches. The side tap is notched out of one of the middle tuyere jackets on the crane side, and is filled with a water cooled cast iron side tap jacket 10 inches x 24 inches.

The furnace slag flows off at the back of the settler into cast iron slag pots, each holding 22 tons. These slag pots are made in sections, with four side pieces and a separate bottom piece. The train of three slag pots is handled by a yard locomotive, and poured over the slag dump.

Matte from the settlers is tapped as required into cast steel ladles 5 feet high and 5 feet in diameter. This is picked up by the electric crane and poured into the converters.

Four converter stands are provided, and three are in use all the time. The shells are 7 feet by 10 feet 6 inches inside, and revolve in tread rings 7 feet 8 inches in diameter. The lining is the ordinary mixture of white quartz and local clay, as there is no quartz in the neighborhood containing copper or precious metals. The blow in the Bessemer converter is carried on in exactly the same manner as in blowing for blister copper, except that the operation is stopped as soon as the iron is eliminated. It is a curious point that copper-nickel behaves as one metal in the converter, and that the ratio of elimination of sulphur and iron in these mattes has exactly the same relation to the amount of copper-nickel present as the elimination of these elements in ordinary copper work has to the amount of copper present. The point of elimination of iron is readily known by the color of the flame, and when this shows that nickel has begun to slag, the converter is turned down and the matte cast into a ladle which is poured by the crane into iron moulds. This matte contains about 80 per cent. copper-nickel.

The charges are brought to the furnaces by three trains of seven or eight cars each. These are accurately weighed before leaving the ore bins, and the amount of flux adjusted to the ore under treatment. Some ores, such as Creighton, require silica; others, as Crean Hill, sometimes require lime; in each case the endeavor is to produce a fluid slag which shall carry as little copper-nickel as possible. Slag from the converters, as well as all scrap and cleanings from the cupolas, are returned to the ore bins. These ore bins are parallel with the furnace building, and 200 feet behind it. The roast ore from the roast yard, green ore from the mines, slag and scrap from the furnaces, coal and coke, quartz, clay and limestone are all delivered on the upper tracks of the ore bins, 35 feet above the charging floor. The ore bins are 700 feet long and 35 feet wide. This makes a row of bins

General View of Cupola Building.

about 30 feet wide inside, and sub-divided into pockets the length of which differ according to the contents and amount of each substance handled. Ore from the roast yard is handled from the roast beds by a steam shovel into Ingoldsby drop bottom cars, which can be dumped readily into the bins.

The ore and other furnace supplies are drawn from the bottom of these bins by means of curved bin gates actuated by a sectional gear wheel and crank. These are spaced at intervals of six feet above two tracks, on which run the charging trains. These tracks form an

oval one-third of a mile in circumference, and pass on each side of the furnaces, allowing the cars to be dumped directly into the cupolas. At a tangent from the curve at one end of the charge track, a line branches off to the sample house. The same cars used in charging the furnaces are used to carry the samples of ores, slags, etc., to the sample house bins, twenty-four in number. On the floor below these sample bins, small end dump cars are used to bring samples to two crushers, from which the ore is automatically sampled and passed through the various fine-grinding machines. The revert or discard from the samplers is collected in a bin, from which it is dumped into charge cars and taken back to the furnaces.

The steam power house, which at present is idle and kept mainly as a reserve in case of any break-down in the electrical equipment, lies to the north of the furnace building and 150 feet distant from it. It consists of a brick building, 156 feet by 101 feet, containing the boilers and blowing machinery, which were used to operate two blast furnaces before the electrical equipment was installed. The water supply from two small lakes a mile and a half northeast of the smelter is slightly acid, containing about 10 to 25 parts of sulphuric acid, or acid salts per million. This is due to sulphur gases from the roast heaps. The water is therefore treated with alkali in a purifying system before passing to the boilers.

There are four Altman-Taylor boilers, each of 400 horse-power. The coal bins are below the charging tracks, and the same train which supplies the furnaces carries coal from the main coal storage bins and drops it into small pockets above and behind the boiler room. The coal is thus delivered by chutes within a few feet of the boiler grates.

In this boiler room is a Blake underwriter pump, delivering 1,000 gallons per minute to the fire lines, and three Snow boiler pumps for supplying the boilers. As a reserve there is in this room a Rand air compressor,

Smelter Building and Sub Station at Copper Cliff.

which can supply air at 100 lbs. pressure, in case of accident to the electric driven air compressor in the sub-station. The exhaust steam from the steam blowing engines is condensed by an Alberger barometric compressor 24 inches diameter with 34 foot head, and dry vacuum pump 8 inches by 16 inches by 16 inches running at 120 revolutions per minute.

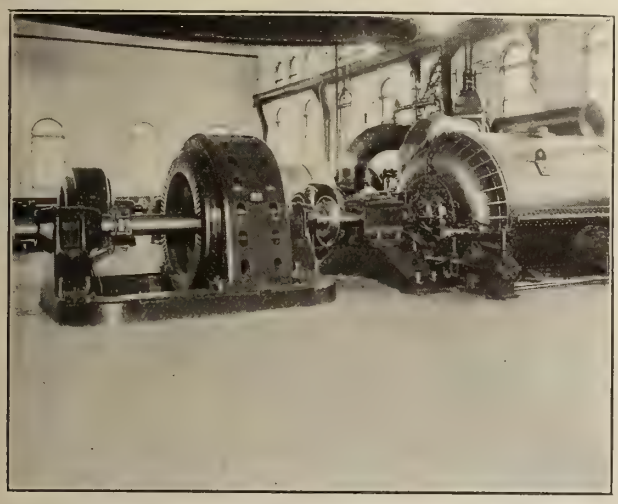
The steam Bessemer blowing engine, made by Nordberg, of Milwaukee, is 15 inches by 42 inches on the high pressure steam cylinder, and 30 inches by 42 inches on the low side. The air cylinders are both 40 inches by 42 inches. This blower delivers 10,000 cubic feet of free air per minute at 12 pounds pressure or 120 cubic feet per revolution. For supplying air to No. 1 and No. 2 furnaces there are two Nordberg cross-compound blowers. These are 13 inches by 42 inches on the high steam cylinder, and 26 inches by 42 inches on the low steam cylinders, both air cylinders being 57 inches by 52 inches. These deliver each 20,000 cubic feet per minute at 45 ounce pressure. The capacity is 236 cubic feet per revolution. Electric power is generated by two tandem Robb-Armstrong engines 13 inches by 20 inches and 26

Slag Pots—Copper Cliff.

inches by 20 inches, which are direct connected to two Canadian General Electric alternating current generators. Each of these is 200 kw., 600 volts, 192 amperes at 200 revolutions per minute.

The motor generator set which provides direct current for electric charging locomotives, takes alternating current at 550 volts, 40 amperes, and delivers direct current at 250 volts, 90 amperes, with a speed of 1,200 revolutions.

In this building is also an electric lighting plant. All this machinery is steam driven and is at present idle, but is kept in reserve in case of accident to electric machinery in the sub-station.



A large Connersville blower is at present under construction for use in this building. This blower has a capacity of 300 cubic feet air per revolution at 60 ounces. This is to be rope driven by two induction motors of 225 horse-power each. It is intended ultimately to replace all the steam driven machinery by electric.

The steam plant has been a valuable reserve at the start, but the new construction involves so much electric machinery that the total power generated by the steam plant would be of little service in case of a break-down of the transmission lines.

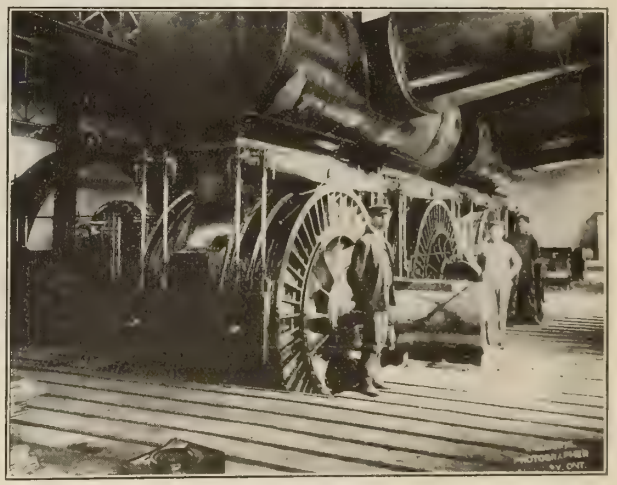
The chemical laboratory, to the south of the furnace building and sub-station, was completed during the winter of 1906. The building is of concrete and brick, all the partitions, stairs, floors and ceilings being of concrete and expanded metal. The building is 35 feet by 80 feet. The basement contains a large storage room for acids and a small room for special research work, a glassware store room, a toilet room, and a large dark room with two sinks and eight lockers for photographic work. In the main storage room a Sturtevant fan heating system draws cold air through a steam coil and distributes the warm air throughout the building. A suction fan, of ample capacity, draws the gases downwards through two concrete ducts from the hood in the working room overhead, and discharges them into the

base of a chimney. A system of compressed air pipes runs along one side of this room over the benches on which the acid carboys are stored, and is used instead of the usual syphons for drawing acid and ammonia from stock.

The second floor of the laboratory contains two halls at either end, opening into the main working room, and at either end of these halls are, at one end, an assay room and a sulphuretted hydrogen room; at the other end, a balance room and an office. The main room is 41 feet 3 inches by 21 feet 6 inches, and is open clear to the tile roof. Above each hall, at either end of this main room, is a ventilating passage leading to two circular fans with electric motors, which in this way gather all the gases which rise in the peak of the roof and discharge them through two circular openings in the outer gables.

Interior of High Falls Power Plant.

The hood is 16 feet by 5 feet in size and 9 feet high. It is covered on top and the sides with heavy wire meshed glass, and is divided by concrete walls, which rise about a foot above the hearth, into three compartments. The suction fan in the basement maintains a very powerful down-draft through ducts in these concrete walls. The hearths are well lighted by a number of incandescent lamps inside the hood, and above the hearth. As the gases are very rapidly withdrawn at a point about a foot above the hearth, there is no corrosion of the lamp sockets or wiring. This hood, being all of glass, with cast iron columns, in no way interferes with the proper lighting of the work benches.



All heat for evaporation and similar work in the hood is supplied by electric hot plates. These are each 12 inches by 18 inches in size and are arranged in groups of eight to cover the hearth of two compartments of the hood. Each plate is connected to a service cable, and is provided with a switch giving three separate temperatures. The lowest heat used is just below the boiling point of water, and is used for slow evaporation. The next heat will boil ordinary solutions, and the highest heat is used for driving off the last trace of sulphuric acid and for baking residues, silicas, and other substances which demand a high temperature. The power used is 110 volts, alternating current, the low heat requiring about 5 amperes, and the highest 15 amperes per plate. The third compartment of the hood contains a concrete hearth with a number of acetylene gas burners, blast lamps, gasoline gas lamps and other apparatus for combustions. Work benches run all around the room on three sides, and two smaller benches lie in the middle of the room at right angles to the hood. The plating bench occupies part of the fourth side, and is supplied with direct current from storage batteries in the substation. The plating of nickel, cobalt and copper is done on series plating frames, the current, density and voltage being regulated by a switchboard in the balance room.

The balance room is 12 feet by 19 feet and contains a heavy bench on concrete piers running down to bed rock with room for five balances. This room is well lighted from the north.

The precipitation of copper, arsenic etc, by sulphuretted hydrogen is all done in a room 12 feet by 15 feet which communicates by a window in the partition with the main work-room. The hoods in this precipitation room are provided with electric hot plates, and are ventilated by one of the fans in the gable. Owing to the care taken in ventilation, it is practically impossible to smell sulphuretted hydrogen, or for that matter any noxious gases in the laboratory.

As previously stated, the furnace building at present in use is intended to cover five cupolas, three of which are at present in operation and two to be erected this year. This will take all the available space in the present building. One of these new furnaces will be blown by a new Nordberg machine similar to those now installed in the sub-station. The fifth furnace will be connected with a large Connersville blower to be erected in the old power house.

To provide for the Bessemer converters, a new building is now under construction. This will be parallel with the present furnace building and sixty feet distant from it. This new Bessemer plant will contain ten converter stands, and will use the new type of Allis-Chalmers converters as described in *The Electro-Chemical and Metal-*

Interior of Sub-Station at Copper Cliff -showing Blowing Engines.

lurgical Industry for June, 1907. This building is of steel and corrugated iron. The crane runway is 35 feet high, the walls 48 feet and the total height to the peak of the monitor is sixty-seven feet.

The main building is 60 feet wide, with a shed 35 feet wide which extends the entire length on the south side and for 112 feet on the north side of the building. The converter department is 280 feet by 60 feet in the main, or by 95 feet including the shed which is used for sculling and matte casting. The relining department is a continuation of the converter department, using the same crane-run. It is 112 feet long, 60 feet wide with a shed 35 feet on each side, making the entire width 130 feet.

Back of this are the storage bins for quartz, clay and old linings, with a floor space 60 feet by 60 feet, and behind this again the machinery for crushing and drying quartz and clay and elevating them to the storage bins. This occupies a floor space of 70 feet long by 60 feet wide. The total length of the building is therefore 522 feet. It is a steel construction, with corrugated iron sides and roof.

Two Morgan electric cranes, 55 feet 8 inches span, with 50 ton main and 20 ton auxiliary hoist, will be used to handle the shells in the lining and blowing rooms.

Furnace matte from the cupola building will be taken across on three tracks to the Bessemer department by means of motors. The matte pots will be lifted and poured by the electric cranes. Owing to the nature of the ground it is not possible to arrange the converter building on a lower level so that the matte can be poured direct from matte cars into the converters. These ten concrete stands are controlled by two pulpits, each handling five stands. The control is entirely electric. Each converter is operated by a 30 horse-power induction motor, with solenoid brake. This is direct connected to a bronze worm which, by two gearings, transmits the power to the drive trunnion of the converter

The slag from the converters is to be poured into steel pots, which are lifted by the crane and set on a slag car, on which it is taken out of the building and poured into a slag casting machine. This casting machine is a circular steel framework 58 feet in diameter, resting on a circular track. On this framework rest cast iron moulds forming a continuous flat ring Each mould is 12 inches by30 inches by 4 inches, and holds about 150 pounds of slag. This ring is slowly rotated under the stream of slag poured down from the slag car. The slow rotation allows time for the slag to cool before the moulds reach a hand controlled tripper, which reverses the mould and drops the material into a hopper. Below this hopper a mine skip takes the slag, carries it up on an incline track and drops it into a steel bin of 500 ton capacity above the charging tracks.

The converter matte will be handled in clay lined ladles by the cranes and poured into moulds under the shed roof. As soon as the lining of a shell is burned out the shell is lifted by the travelling crane and placed on one of the sculling cars which run on standard gauge tracks from the main building, out under the shed roof on the south side. The space between columns in the main buildingis filled with sheet steel doors of the roller blind type, which can be raised and lowered to allow the sculling cars to pass out. After the shells are sculled, the cars are pushed back, and the shells lifted by the travelling cranes and carried to the relining platform.

Smelting Plant from South. Ore Bins in Distance.

Here, they are dropped on cars at each side of a sixty foot platform, twenty-five feet wide and ten feet high. This platform is in the centre of the relining department, with space on each side for five relining cars. Down the centre of this relining platform run two narrow gauge tracks, which bring the mixture of quartz and clay from the Carlin mills.

The lining is done by ramming machines which are handled by jib cranes, three on each side of the platform. The tops are to be lined by ramming around a mould instead of by hand, as at present

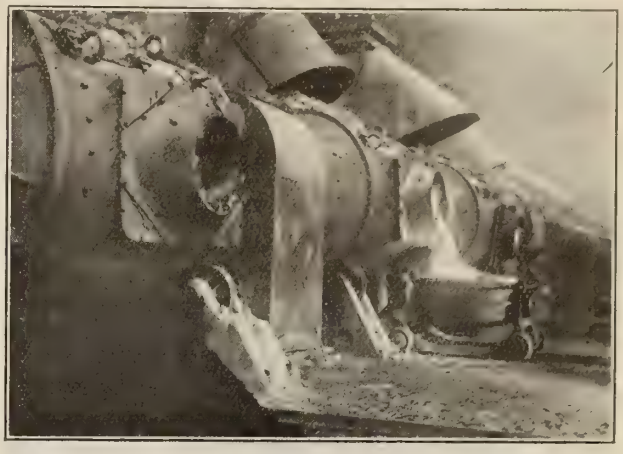
As fast as the shells are lined, and the tops are replaced, the lining cars are pushed out under the shed roof, which lies at each side of the relining room. This brings the shells under a row of hoods and along side of a wood storage platform, from which the cord-wood is handled for drying the lining.

When this has been completed, the cars are again

pushed back to the lining platform, the shells lifted off and placed on the blowing stands by the travelling crane, and the cars are ready to receive a fresh shell for lining. The motion of the drying cars back and forth from the lining platform to the drying hoods is effected by ratchet gears on the cars.

The quartz and clay mixture for lining is made up in the crushing department, above which are the storage bins. These bins are of sheet steel and hang from the side and central columns in a catenary curve. There are six bins, one set of three on each side containing, respectively, crushed quartz, dry clay and old converter linings from the sculling shed. On each side below each bin-row are narrow gauge tracks on which run side dump cars which gather the mixture of clay and quartz from the bins and dump it into the mills. These tracks are on platforms five feet above the relining platform level. The crushed mixture is taken from the mills by a plough attached to the side of each pan, which scrapes the mixture off the pan and delivers it into cars which run down the centre of the mill floor and out along the relining platform. In this way the usual wheel barrow work is avoided. Space is provided for six mills, three on a side, each mill being below the level of the tracks which bring the supply of quartz and clay, and above the level of the tracks which take away the crushed and mixed product to the lining platform.

At the rear of the bins and mills are the quartz crushers and clay driers. These occupy a floor space 60 by 70 feet. On either side of this end of the building are standard gauge tracks, on which quartz and clay are brought in. The clay is all passed through a Ruggles-Coles dryer, which removes the moisture and rolls it into the shape of pellets. This is necessary in winter, in order to avoid freezing in the bins. During part of the summer drying is not required.



Quartz comes from the quarry in two forms, lumps and screenings. In summer the screenings can be passed

Crean Hill Shaft House and Engine House

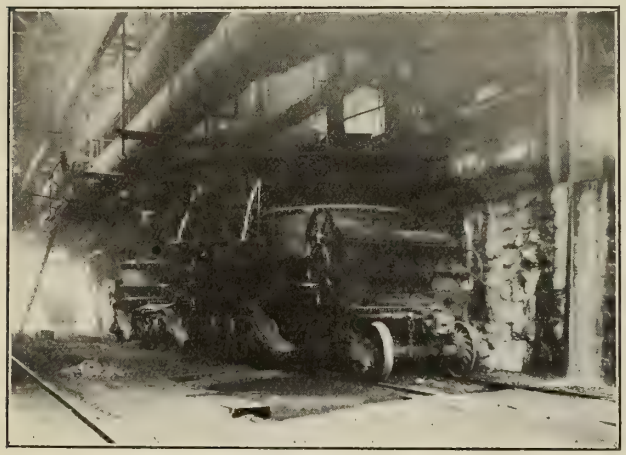
direct to the bins. In winter the screenings are wet and frozen, so that they require drying. A small rotating dryer is provided for handling these frozen quartz screenings. The coarse quartz passes from the cars on to a platform, from which it is fed directly into a Blake crusher, elevated by belt to a roll, passed through a dryer, if necessary, and, if not, then elevated to the bins by bucket elevators. The spreading and carrying of material to the proper bins is done by travellings belts.

The ore supply comes at present from the Creighton and Crean Hill mines. The Creighton Mine is well known as the largest body of pyrrhotite carrying nickel and copper that has been opened in the Sudbury district. It lies on the border line between the Townships of Creighton and Snider; the present operations being all in the Township of Snider. The mine is worked as an open pit of oval form about 225 feet from foot to hanging wall. The pit is at this time about 160 feet deep. In the bottom of this pit thirteen tracks converge like the ribs of a fan to an entry on the footwall leading to the inclined shaft. The ore is broken from the side of the open pit in steps, and thrown down to the tracks, where it is block-holed, or broken up and trammed to the shaft.

Converters—Copper Cliff

About 330 feet west of the old shaft, a new shaft has been sunk during the last year, and a raise has been made connecting the bottom of the new shaft with the surface to the west of the present open pit. This will more than double the producing capacity of the mine. During the last year also the entire surface equipment of steam-driven machinery has been removed and replaced by electrical machinery. The sub-station at the Creighton mine contains three transformers of 275 kw. capacity each. These bring the voltage down from 35,000 to 550 volts. There are two hoisting engines, each carrying three drums, which are so arranged that any two can be run in counter-balance, or all three run independently. These hoisting engines are operated by 150 horse-power 3-phase variable speed induction motors. The rope speed is 500 feet per minute, and the capacity is three tons to each skip. The two hoisting engines are set at right angles to each other, the new shaft being operated by a hoist which is parallel with the new rock house. The old rock house and shaft, 500 feet to the east, is operated by the second hoisting engine, the ropes making a turn through sheives behind the old rock house.

The mine drills are supplied by a compound, direct driven compressor, running at 120 revolutions per minute and giving 1,635 cubic feet free air per minute. This is driven by a constant speed 550 volt induction motor of 300 horse-power. The air regulation is obtained by automatic Corliss step valves.



The fire protection equipment consists of a 1,000 gallon 6 inch 4 stage pump, direct connected with a 150 horse-power 3 phase 550 volt induction motor. To supply this a steel tank holding 60,000 gallons is erected just outside the power plant.

The rock house at the old shaft is a wooden structure 42 feet by 46 feet, and 72 feet high. The new rock house at the Creighton is built of reinforced concrete up to the bin floor. Above this the walls are three inch plank, ten inches wide, spiked together. There are three

skip tracks entering this building and delivering the ore over the grizzlies, through which the smaller fragments fall direct into the bins. The coarse ore is fed into two crushers 30 inches by 18 inches. From these the crushed ore passes through revolving screens on to rubber belts 3 feet wide and 50 feet long. Here the rock is picked out and thrown into a rock pocket, while the ore passes over the belt into the ore bins. Two railway tracks beneath the rock house admit the trains on which the ore is taken to the roast yards at Copper Cliff.

The crushers and belts, which are in two sets, are each operated by a 50 horse-power 3 phase 550 volt induction motor, and the mine water is handled by a 100 gallon pump geared to a 15 horse-power 550 volt motor, which operates at 750 revolutions per minute.

For the convenience of the men, a large "Dry" has been built adjoining the shaft house. This building is of brick, 36 feet by 80, and is well lighted and heated. It contains 205 lockers for clothes, three long enamelled iron basins, each fitted with taps for hot and cold water, and in an adjoining room shower baths and water closets are provided.

Back of Furnace—showing Slag Pots

The Crean Hill mine, which has been opened up within the past year, lies in lot 5, concession 5, in the Township of Denison, about a mile and a half northeast of the Vermillion mine. The hill rises sharply from a swamp and shows a number of outcroppings, which are strung out in an east and west line. Extensive diamond drilling operations were conducted before the location of the shaft house was determined. The ore at this mine seems to lie in veins from 50 to 80 feet in width. Whether these veins continue, or whether they overlap, will be brought out by the development of the mine.

The ore contains a larger proportion of pentlandite than the normal ores, and as the rock involved is a mixture of soapstone and greenstones, it requires entirely different treatment from the massive ores found at Stobie and Creighton. A branch line three and one-half miles long has been constructed from the C. P. R. at Victoria Station to the mine. The rock house, Dry, engine houses, etc., at Crean Hill are an exact duplicate of those at Creighton, except that in this case one hoisting engine with three drums is used, as but one rock house has to be considered.

The foregoing description covers the plants at present in operation, or under construction at the Cliff, and the mines, for the treatment of copper-nickel ores.

Plans have been drawn and work will this year be commenced on the new shops at Copper Cliff. These will adjoin the smelter to the south of the present buildings, and will replace the present inadequate buildings which surround the old Copper Cliff mine. The new equipment will consist of machine, blacksmith and foundry shops under one roof, a warehouse and gantry crane storage yard, a large carpenter and pattern shop, and a roundhouse for seven locomotives. It is expected that this construction will be completed before another year, at which time the plant of the Canadian Copper Company will challenge comparison with any smelting plant in the United States or Canada.

IRON MINING IN BRITISH COLUMBIA

It is reported that mining operations are to be resumed at the Texada Island iron mines, the ore from which will be treated at Irondale, near Port Townsend, where a new plant is at present being installed. These mines have been worked intermittently for several years past, the product, which was smelted with a mixture of 1-9 to 3-10 of bog ore, having been marketed in San Francisco, and used in the construction of United States battleships. The property is situated on the southwest of Texada Island and includes some 2,700 acres. The ore mass, which varies in width on the surface from 20 to 25 feet, is an irregular contact deposit between limestone and granite, and may be traced northward along a ridge following the coast line for a distance of nearly four miles. When operations were in progress some years ago it was estimated by experts that the development at that time had exposed an ore body representing five million tons of commercially valued ore in sight. The ore has been analyzed on several occasions in the laboratory of the Canadian Geological Survey, and the following result was obtained from one sample submitted:—

Iron	69.85
Manganese	Trace.
Siliceous matter	2.75
Sulphur	.06
Phosphoric acid	Trace.
Moisture	Trace.

This return, however, was doubtless secured from an exceptionally fine specimen, as it is questionable whether the average of the ore will exceed 50 per cent. metallic iron.

So long ago as 1872-3, the deposit was reported on by Mr. Richardson, of the Geological Survey, who thus describes the geological features of the locality:—

"Three miles northwesterly from Gillies Bay, and about seventy paces from the shore, a small exposure of magnetic iron ore was met with, associated with a cross-grained epidotic rock and grey diorite. Immediately north of this exposure, the ground rises steeply to about 450 feet above the sea. Here on the eastern and south-eastern slopes of the hill, for about 150 feet down and extending from 200 to 250 feet in length, is an exposure of rich magnetic iron ore. On the outcrops, facing to the northwest, the ore bed is seen to be from 20 to 25 feet thick, and to rest on grey crystalline limestone, with which, for about two feet down, are interstratified bands of ore, of from half an inch to one inch in thickness. The hill still rises to the north and northeast, but along the flank, and at about the same elevation in a northwesterly direction for nearly a mile the ore is occasionally seen, and in one place there is a continuous exposure of 250 feet. . . In the concealed intervals the course of the bed appears to be indicated by a coarsely crystalline epidotic rock, carrying ore in places, but with the grey

limestones apparently overlying it to the northeast, and the grey and green dioritic rocks beneath it to the southwest . . . In a northeasterly direction from the first noticed exposure, for a quarter of a mile, no ore is seen, after which it is again found, at first in irregular patches mixed with epidotic rocks, and then its course becoming more noticeable, for more than half a mile the bed presents an irregular surface exposure of from 600 to 900 feet of nearly pure ore."

Dr. Dawson, commenting on Mr. Richardson's report, differs from the latter in respect to the nature of the ore deposit, which he describes as neither a bed nor a true vein, but a contact deposit which has been produced at or near the junction of the granitic mass with the stratified rocks, and more particularly with the limestone.

On the second exposure referred to by Mr. Richardson, development work was concentrated for some time, a shaft being sunk and a cross-cut run into the hill at a depth of 150 feet. Here, after passing through dioritic rock, a very fine body of ore was encountered, over a hundred feet in thickness, and affording a remarkably high return of metallic iron.

In addition to the occurrence noted, another deposit of magnetite occurs on the northeast side of Texada Island, while important deposits are being developed on the west coast of Vancouver Island, and there is every reason to believe that here and in other localities the available resources are sufficiently great to promise an abundant supply of raw material for the up-building of a flourishing and important iron industry on the British Columbia coast, when the conditions are ripe for its establishment, and those conditions are now within measurable distance of fruition.

DR. EDWIN GILPIN

Dr. Edwin Gilpin, Deputy Commissioner of Mines for Nova Scotia, died on July 10th after a few days' illness.

The late Dr. Edwin Gilpin.

Dr. Gilpin was born in Halifax, N.S., in 1850. His father, the late Rev. Dean Gilpin, was for years a successful teacher, and throughout his long and useful life a distinguished and ardent worker in the Church of England. Dr. Gilpin's grandfather was the Hon. T. C. Haliburton, known to the world of letters as "Sam Slick." On his father's side, Dr. Gilphin could claim descent from Richard de Guylpyn, who flourished in 1206 in Westmoreland, England.

Edwin Gilpin, Jr., graduated from King's College, Windsor, N.S., in 1871. From the same University he received the degree of A.M. in 1873, his course being a special one in mining, geology and chemistry. During his college course he began the practical study of mining engineering. At the Albion collieries of the General Mining Association, in Pictou County, he gained his first mining experience. Later he visited extensively the leading mining districts of Great Britain.

In 1874 he was elected a Fellow of the Geological Society of London, England. His membership of the Nova Scotia Institute of Natural History dates from 1873. To this institution he has always been a source of help and support.

In 1879 and 1881 he was successively appointed Inspector of Mines and member and secretary of the Board of Examiners of Colliery Officials for the Province of Nova Scotia. In 1885 he was elected a member of the American Institute of Mining Engineers, and in 1886 he received the appointment of Deputy Commissioner of Works and Mines. This position he held until the time of his death.

Dr. Gilpin, during his active life, contributed scientific papers, many of them unique sources of information, to the transactions of the leading societies in Great Britain and America. The annual reports of the Mines Department to the Government of Nova Scotia were issued under his direction.

BOOK REVIEWS

"Electric Blasting Apparatus and Explosives: With Special Reference to Colliery Practice," by Mr. Maurice, Mining and Electrical Engineer, London. "The Electrician" Printing and Publishing Company, Limited. Salisbury Court, Fleet street; pp. 166; price, 8s. 6d. net.

This much-needed book was written in the hope that it would prove to be a useful work of reference for mine managers, engineers and others. Particular attention is paid to the problem of safe shot firing in coal mines.

Chapter I. takes up electric fuses and detonators, exploders, wire and cables, and test; Chapter II., explosives and explosive risks; Chapter III., a most invaluable chapter, deals with practical applications, and Chapter IV. with the laws and regulations relating to the storage and use of explosives. An appendix gives a list of permitted explosives. The illustrations are numerous and well chosen.

EXCHANGES

In *The Mining World* of July 13th Ralph Stokes writes of "Mount Bischoff Tin Mine, Tasmania." The "Mount Bischoff's" monthly average production of block tin has fallen from 229 tons in 1885 to 60 tons in December, 1906.

The Colliery Guardian, July 5th, reprints a paper on the "Polmaise Collieries," recently read before the Mining Institute of Scotland. The safety lamps used in these collieries are magnetically locked and electrically ignited.

The Mining World, July 6th, celebrates the beginning of its twenty-seventh volume by reducing its size to the

standard 9 inch x 12 inch page. There is, however, no reduction in the amount of reading matter. In this number Mr. R. S. Moss writes of the "Manufacture of Coke from Western Coal." He describes an improved coke oven. "Examining a Placer Property" is also very well worth reading.

The Chemical Engineer, June, contains a paper by Alfred Sang on "Protecting Iron and Stetel from Corrosion." Of metal coatings the writer says: "If the metallic coating is considered merely as a garment which protects the iron article from atmospheric influences, the points which must receive special consideration are the closeness of the fit and the impenetrable qualities of the coating."

The Iron and Coal Trades Review, July 5th, has a description of Eskbank Ironworks at Lithgow, New South Wales. A new blast furnace was recently erected there under the superintendence of Mr. Pennymore. It has a capacity of 500 tons per week. It is somewhat surprising to notice from the protograph of this furnace that in general lines, and in equipment, such as vertical elevator, stores, etc., modern designs have not been closely followed. In fact, from its appearance, the furnace might have been designed ten or fifteen years ago.

The Engineering Magazine for July presents some articles of particular value. The concluding number of a series of papers on "Hydro-Electric Power Versus Steam for Industrial Plants, by H. Von Schon, closes with this paragraph: "Generally speaking, an investment of from $160 to $180 per horse-power delivered will show a net earning capacity of 6 to 8 per cent. These are rather high cost figures. The large majority of hydro-lectric developments range between $125 and $150 per horse-power and are therefore capable of a commensurate increase in net returns. The value of these investments is, however, more likely to increase than otherwise, since every indication points to a rise in the price of power service in all branches of industry."

The Engineering and Mining Journal, July 13th, editorially discusses the action of the Indiana Legisalture in prohibiting coal miners from using drills exceeding 2 1-2 inches in diameter, when drilling a hole in coal for blasting purposes. It is claimed that the law limiting the quantity of powder used to six pounds is a sufficient safeguard against blown-out shots. *The Engineering and Mining Journal* points out that, when State Legislatures begin to investigate the quality of powder used, instead of so carefully regulating the quantity, the number of fatalities resulting from blown-out shots will be reduced. It recomends the preparation of a table of permitted explosives.

A correspondent in *The South African Mines, Commerce and Industries* for June 15th writes thus of overcapitalization: "It is obvious that in mining finance, more than in any other branch of finance, the difficulties of 'proper capitalization' are considerable, since it is dependent on the exact estimation of profits which by the very nature of underground operations is difficult to attain. If those who are prone to explain so much by 'over-capitalization' looked with any sense of fairness at the present prices of Rand securities, they would see that, despite the depression, there are more instances of shares standing at over par than below."

The Mining Journal, June 29th, concludes an editorial on "The Rand Strike and the Outlook" with these words: "The nearer future of the Rand, it seems to us, must depend very much on what the Government is able to do for the industry, and therefore their mutual cooperation is greatly to be hoped for, since the present policy of constant hostility by the mining interest can only result in making the Government incline more and more towards the Socialistic labor party, which is arising in South Africa, as it has already done in all our other colonies."

PERSONAL AND GENERAL

Mr. J. B. Tyrrell is examining properties in the Montreal River district.

Mr. Cyril Knight, of the Ontario Geological Survey, is in Tilbury, Ont.

Dr. Eugene Haanel, Director of Mines for the Dominion, is absent from his office on a vacation.

Mr. Anthony McGill has been appointed Chief Analyst for the Dominion, in succession to the late Dr. Thomas Macfarlane.

We regret to record the death which occurred recently in Toronto of the father of Mr. J. E. McAllister, the manager of the British Columbia Copper Company.

Dr. K. Leith of the University of Wisconsin, was in Toronto on the 14th July. Dr. Leith is exploring the newly discovered extension of the Misabi River range.

Mr. N. Angrignon, a well-known miner, has been appointed foreman of the British Columbia Copper Company's "B.C." mine, in Summit camp, Boundary district.

Mr. Frederic Keffer, engineer of the British Columbia Copper Company, and president of the Canadian Mining Institute, is spending a vacation in Vancouver and Victoria.

Messrs. George Caverhill, of Montreal, and Mr. W. G. Ross, managing director of the Montreal Street Railway Company, have been appointed directors of the Dominion Iron & Steel Company, to fill vacancies on the board.

Mr. H. E. T. Haultain, general manager of the Canada Corundum Company, Craigmont, Ont., passed through Toronto on his way from New York. Mr. Haultain has been looking into the manufacture of abrasives in the United States.

"Joe" Taylor, a pioneer prospector in the Boundary district, where he located the Dominion Copper Company's "Brooklyn" and other important mines, died at the General Hospital at Phoenix on June 31st, at the age of 66. He was a genial and kindly soul and enjoyed a deserved popularity.

Mine wages in British Columbia are advancing in all districts, and following the example set by mine managers in Rossland and Boundary, the Yale Mining Company, operating at Hedley, in the Similkameen, has increased the scale from $3 to $4 a day, and reduced the hours of work to eight.

It has several times been claimed that platinum has been found in place in the Tulameen, Yale district, B.C., but it is only recently that capital has shown any disposition to investigate these claims, a group of properties on Champion Creek having been bonded this month to Colorado investors for $80,000.

The task of reporting on the iron ore resources of Vancouver Island and other areas on the Pacific seaboard in which the mineral occurs, for the Federal Department of Mines, has been entrusted to Mr. J. Lindeman, whose report will be published in a monograph on the subject of the Dominion's iron resources to be issued by the Department.

ordinary bituminous coal to lignites. From the Pacific coast to Behring Sea and the Arctic Slope, through the valleys of Copper and Yukon Rivers and their tributaries, coal beds are widely distributed. The work of

the present season will include studies of the coal-bearing rocks of the southeastern part of the territory and of the Yukon coal fields so far as they are accessible from the Yukon River.

Mr. C. D. Rand, a well-known broker, has been elected president, and Mr. J. Kendall, F.C.A., secretary of the Vancouver Stock Exchange, to which the British Columbian Legislature granted a charter at its last session.

Mr. Fritz Cirkel visited Toronto on July 17th. Mr. Cirkel, with two assistant engineers, is gathering information concerning all the producing mines, metallurgical establishments and the mineral industries in general of all Ontario. The hand-book, in which all these facts will appear, in conjunction with similar information from every Province of the Dominion, will be published by the Federal Mines Department early in 1908.

Mr. Herbert Carmichael, Provincial Assayer of British Columbia, has been delegated by the authorities to make a reconnaissance survey and make a complete report on the resources of the country tributary to Alberni, on the east coast of Vancouver Island. At one period this district boasted more than one producing mine and the surface prospects appeared quite promising. The present work will include the surveying of Great Central Lake, and it is proposed to establish stations from which triangulations will be made.

Bulletin No. 314, published by the United States Geological Survey, is of special interest to Canadians, in that it treats of the coal areas of Alaska, and consequently has considerable application to the Yukon. This report states that of the 600,000 square miles forming the territory of Alaska, it is estimated that 12,644 square miles are underlain by rocks that probably contain coal seams, and that 1,238 square miles contain workable coal, ranging in age from Carboniferous to Tertiary, and in composition from anthracite of good quality through high grade semi-bituminous steam and coking coals and

An exceedingly interesting report has been issued by the British Home Office under the title of "Colonial and Foreign Mineral Statistics." This report shows that in 1900 the number of persons engaged in mining and quarrying in the world exceeded five millions, of which approximately one-third were employed in the British Empire. As however these statistics do not include the labor employed in the metal mines and quarries of the United States and some other lesser important countries, they are not conclusive. More than half of the labor mentioned was employed in coal mining, Great Britain employing over 843,000 persons alone, the United States 626,000, Germany 548,000, and France 175,000. The coal produced during this period amounted to 941,000,000 tons, the value of which is estimated at over $1,500,000,000. In point of relative importance, it is interesting to note that Canada takes second place, following closely on India, among the coal-producing possessions of the Empire, though our output of, in round figures 8,000,000 tons, appears small in comparison with the enormous production of the Mother Country of 239,918,239 metric tons. Of the world's gold output the Empire contributed 59 per cent.; Australia contributing 19 1-2 per cent., the Transvaal 26 1-3 per cent., and Canada 3 3-4 per cent. The total value of the world's output of minerals is roughly estimated as representing about $3,500,000,000. The death rate from accidents in coal mines in this year was 2.72 per 1,000 in British Columbia and 1.86 in Nova Scotia, as compared with 1.35 in the United Kingdom and 3.45 in the United States.

Mr. W. H. Cowell, formerly associated with the Algoma Steel Company, Sault Ste. Marie, has been appointed secretary-treasurer of the Wellman-Seaver-Morgan Company, of Cleveland, Ohio.

Mr. John MacDonald, who until recently has been on the engineering staff of the Trethewey mine at Cobalt, has been appointed manager of the Foster in this camp.

Mr. J. Argall, manager of the Iron Mask mine at Kamloops, B.C., now being successfully operated by an English company, has returned to British Columbia from a visit to the Motherland.

It is to be noted that another important discovery of mica is reported to have been made some forty miles north of Buckingham, Que., and development operations have been already commenced.

Mr. Alexander Henderson, of Vancouver, a former County Court Judge for the Province of British Columbia, has been appointed Governor of the Yukon Territory, in succession to the Hon. W. W. B. McInnes.

The Council of the Society of Arts (London) are offering a gold medal or a prize of £20 for the best portable apparatus or appliance for enabling men to undertake rescue work in mines or other places where the air is noxious.

The United States Consul at Victoria, in an official report to his Government, states that the British Columbia output of copper has increased 800 per cent. in ten years, while that of the rest of Canada has increased 50 per cent. in this period. To the successful mining of copper is attributable largely the improved showing of the Western Province in respect to profit-earning distributions, the dividends paid last year by the mines aggregating in amount, it is said, between three and four million dollars.

In a leading article *The Iron and Coal Trades Review* refers at length to the extraordinary expansion of the steel industry in the United States, as indicated by the largely increased output and more presently by the number of new blast furnaces which have already been built this year or are being completed. Thus since January last no less than nine furnaces have been blown in having a rated annual capacity of 1,260,000 gross tons, while twenty-seven others are in course of construction, the rated capacity of which is roughly four million tons annually.

Mr. D. D. Rosewarne, F.G.S., London, M.I.M.M., M. Am. Inst. of M.E., has arrived from England to spend a few months in the examination of the Cobalt and adjacent districts on behalf of London financiers. Mr. Rosewarne was one of the early pioneers of the Broken Hill district of New South Wales, and, having spent his boyhood days in the Comstock, Nevada, U.S.A., should have an intimate knowledge of silver ore. For some years he was Chief Inspector of Mines for the South Australian Government. He intends making his headquarters at Haileybury.

Mr. L. Pratt, the manager of the Last Chance mine at Sandon, B.C., in an interview published in a Nelson paper, speaks very favorably of the conditions now existing in the silver-lead sections of West Kootenay, due of course in a measure to the present high prices of the metals. Another erstwhile important mine, the Good-enough, has been reopened, and there is a general activity throughout the district. It is to be noted that under the terms of the Bounty Act, producers of lead ore are no longer entitled to the subsidy, since the price of lead in London is now quoted at over £20.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay, July 15th, 1907.

A regrettable accident occurred at the new No. 4 winning of the Nova Scotia Steel & Coal Company on the 6th of July, by which three men were fatally injured. Two tubs, one filled with coal and the other with water, ran back down from the bankhead and collided with these men at the face of the deep. The evidence given at the inquest appears to prove that the accident was due to the neglect of the chain runner to turn a switch after the rope was knocked off at the brow of the slope. There was laxity, but not such laxity as would warrant the headlines and the attitude of *The Halifax Herald* in its issue of the succeeding day. Under the usual red headlines the *Herald* writer makes some very naive comments on "the mine running without 'Sampsons'" and other matters, and we rather suspect the writer had a very vague idea of what a "Sampson" is. To quote: "Attorney-General Pipes will not be held guiltless if he allows anyone to escape, whether it be officials in the management of the mine, or chain runner, or whoever else may be responsible. It will be no use for Hon. Mr. Pipes to say that he is leaving the enforcement of the law to the Cape Breton police. He should act, and act at once, and order the arrest of whoever is responsible, or of all who are responsible."

We do not think such language is called for by the circumstances of the case, sad as they are. The officials of the Nova Scotia Steel & Coal Company are not going to abscond, nor do the mining community of Cape Breton need the assistance of *The Halifax Herold* in what is distinctly their own business.

Since the date of the above remarks it has been plainly brought out in the coroner's inquest that the accident was the direct result of disobedience of orders, and there is no doubt that proper cognizance will be taken of this. But no thanks will be due to *The Halifax Herald,* whose irritating proclivity to offer advice on matters with which it is imperfectly acquainted is becoming so proverbial that any efficacy its remarks once possessed has now disappeared.

Glace Bay, C.B., July 12th, 1907.

After a great many delays the petition for a plebiscite on the question of the retention or the non-retention of the so-called "Scott Act" has been allowed by the powers at Ottawa, and it is understood that the plebiscite will now be taken. There is, therefore, a possibility that the Scott Act may be repealed in Cape Breton County, and that the Provincial Licensing Law may take its place.

The liquor problem has a very decided bearing on the mining industry of this Island, and almost anything would be better than the present farcical state of affairs now prevailing here. Reference has been made on a previous occasion in these columns to the loss of output occasioned fortnightly by the "pay-day drunk," and it is a moot question whether the Scott Act, or rather the way in which this Act has been maladministered, is not to blame for most of this lost time and disorganization of all colliery business.

The Scott Act makes the sale of drink illegal, and provides all sorts of penalties for the offender. Somehow, notwithstanding, the drink is sold, and in large quantities, but as the traffic is theoretically illegal no supervision of the quality of the liquor dispensed is possible. Consequently our miners get their "pizen" of a peculiarly deadly and ghastly blend, stuff that maddens and paralyzes at very short notice.

Further, the various abortive and spasmodic attempts that are made to enforce the law make it necessary to maintain the semblance of secrecy. Secrecy always makes a bad thing worse, and it does not need a labored argument to prove that slinking round a corner in a surreptitious manner to get a drink is not calculated to increase the self-respect of any man. Once he gets into a bar he finds it is advisable to take a bottle of "square face" home with him because of the difficulty of getting another drink. The consequences are inevitable, and are also very apparent when Monday's colliery outputs come to be reckoned up. Everybody in Cape Breton knows how thickly the country roads, parks, and every cemetery and back lot is strewn with whiskey flasks in various stages of brokenness. These things are everywhere, and they tell their own unmistakeable tale. The motormen on the electric railways know the effects of a "pay-day jag," and many a poor fellow has met his death under the cars when laid across the rails, which in this country seem to exercise a peculiar fascination for the man who is drunk on Scott Act "firewater."

The experience of the Colorado Fuel & Iron Company in this matter of the "pay-day drunk" is well presented in a thoughtful article by Lawrence Lewis that appeared in *The Engineering and Mining Journal* for the 29th June last. Of course, social conditions in the mining camps of Colorado and in the coal fields of Cape Breton are not by any means the same, but nevertheless the social problems of mining districts are the same the world over, and only vary in their intensity. In the experience of the company referred to prohibition proved an utter and total failure, and culminated in a glorious orgy on the 4th of July, 1901, which laid their mines off for five days. Prohibition has always proved a failure, and will always prove abortive in any community where even a small minority of public opinon countenances the use of liquors. The Colorado Company instituted a "restricted club" with bar room, billiard room and pool rooms, card and game rooms, where limited stakes were allowed, and a well-provided reading room. This restricted club is said to have changed the Town of Coal Basin from a "prohibition to a temperance town." Into this sentence is packed a wealth of ironical and practical wisdom.

There is no disguising the deadly monotony of life among the miners in the average coal mining colony, more particularly among the newcomers and foreigners. Take the position of German, Belgium and English miners who come to Cape Breton from the mining towns of the Old World. They have from childhood been in the habit of imbibing light wines and beers, and have all their lives had places of amusement to visit. The German has his "bierhalle" and "theatre," the Frenchman his "cafe chantant," and the Englishman his "pub" and colliery reading room. Everyone of them in all likelihood has had his little garden allotment also. Then they find themselves in Cape Breton, where to drink is a legal crime, and where a man must cover his tracks if he wants a pint of beer, as if he were some nocturnal marauder. When he gets his drink he is oftentimes ignorant of its vicious nature, and he is in the hands of the policeman or has unknowingly committed some assult before he really knows what he has done.

The farce of Scott Act administration is, further, a moral canker that is steadily undermining the respect for law that should be inherent in the breast of every subject of the King. It opens a door for every kind of "graft" and political jugglery. In a word, the present condition of the liquor traffic in Cape Breton is a standing menace to the industrial prosperity of our coal fields. A most significant factor in the present agitation is that the liquor dealers themselves wish to see the Scott Act retained. The rum-seller is not usually a philanthropist either.

There can be no doubt in the opinion of a great many thinking people in Cape Breton that a properly framed licensing act, with restricted hours, Sunday closing, and honest police supervision, will more efficiently control a traffic which, while not the most beneficial in the world, yet exists in response to a public demand, and it will further put the publican on the same footing as the grocer who sands his sugar or sells margarine for butter. The

man who wants his glass of beer should be able to get one in an open manner, and not have to skulk in holes and corners for fusel oil and dilute brimstone.

While the present Scott Act remains in "force" the hands of the coal operators are tied, and they could not if they wished attempt a sociological campaign for the amelioration of the present unsatisfactory conditions, and any attempt to run reading rooms or clubs on strictly temperance lines or "Sunday School" methods is foredoomed to failure.

ONTARIO.

Cobalt.—Your correspondent has been so much occupied with strikes and rumors of strikes that the gathering of news has been neglected. The Western Federation has succeeded, with the help of the managers, in bringing about a deadlock. The policy of the Federation leaders was simply and solely to prove to the men that they, the men, could get anything they asked for. The managers foolishly (as events have proved) gave out their ultimatum at the precise moment when it best served the purposes of the imported professional agitators. The managers could have silenced the men by concessions at an earlier date; or they could have preserved silence—probably the wiser course of the two. If the initiative had been left to the men they could not have manufactured a case. If the leaders of the Federation had not openly boasted of their power to get any terms, a settlement would have been easily reached. As it is, foreign interference has brought about a cessation of work, has injured the reputation of the camp and has embittered the relations of the managers and men. The point is that if the men had been left to themselves they would have got peaceably whatever reasonable concessions justice demanded, without injury to themselves or to the camp. The demagogues of the Federation have rendered calm deliberation impossible, have belittled the Government's represntatives, and have encouraged the spirit of opposition. This is not armchair criticism.

GENERAL MINING NEWS

NOVA SCOTIA.

Sydney, July 12.—It is understood that the transfer of the Gowrie and Blockhouse Collieries and other areas at Port Mouton and vicinity to the Atlantic Coal Company, Limited, has been practically completed, and that operations on a large scale will shortly commence. Nicholas Richardson, of Newcastle-on-Tyne, who represents the interests of the British investors, will, it is stated, undertake the management at the collieries. Mr. Richardson left by to-day's train for Halifax. The people of Port Morien as well as those interested in the new company have every confidence in the future of the town and the operation of this important enterprise.

Sydney.—The Dominion Iron & Steel Company will not be seriously affected by the destruction of the Wabana ore piers. At Sydney fully six months' ore is in stock. It will be quite possible for the company to make up the loss by extra effort.

At the new mine of the Nova Scotia Steel & Coal Company three miners were killed on July 6th, through the carelessness of a chain runner.

ONTARIO.

Sudbury.—Prince Luigi, Duke of the Abruzzi, visited Copper Cliff early in July. The Prince arrived in the private car "Cignet," in which Mr. and Mrs. S. H. P. Pell, of New York were his hosts. The party was entertained while in Copper Cliff by President A. P. Turner.

North Bay.—The Trout Lake smelter, near North Bay, is nearly completed. Already some ore has been treated.

Mr. J. J. Bell, of Toronto, is to take up certain branches of the work connected with gathering information for the Mines Department of Ottawa. The clay industry and certain mining sections of Western Ontario will constitute Mr. Bell's field.

Cobalt.—The Cobalt Right of Way Mining Company on July 16th declared a dividend of 7 per cent., the second within three months at the same rate. Two carloads of ore gave a profit of $61,840 after paying all expenses. So far all mining has been done by hand. But the compressor will be running within a few days.

The following table shows what has been offered and demanded in Cobalt in the way of wages and hours, as compared with the compromise finally rejected by the owners:—

Surface Labor.	Owner's offer, 10-hour day.	Men's demands, 10-hour day.	Compromise rejected by owners, 9-hour day.
Carpenters	$3.25	$3.75	$3.50
Do., helpers	2.50	2.75	2.75
Mechanics	3.75	3.75	3.50
Pipe Fitters	3.00	3.25	3.50
Blacksmiths	3.75	3.75	3.50
Do., helpers	2.50	3.00	2.75
Engineers (hour)	.30	.35	.35
Firemen (hour)	.25	.30	.30
Ore Sorters	2.75	3.00	2.75
Do., helpers	2.50	3.00	2.75
Hammersmen	2.75	3.00	3.00
Teamsters	2.50	2.75	2.75
Hoistmen	2.75	3.00	2.75
Cage or Bucketers	2.25	3.00	2.75
Others on surface	2.25	2.75	2.75

Underground Labor.	Owner's offer, 10-hour day.	Men's demands, 8-hour day.	Compromise rejected by owners, 9-hour day.
Timbermen	$3.25	$3.50	$3.50
Machine men	3.25	3.25	3.50
Do., helpers	2.75	3.00	3.00
Cage or bucketers	2.50	3.00	3.00
Others underground	2.50	3.00	3.00

The miners also asked that not more than 65 (instead of 75) cents per day be charged for board; miners in shafts, 25 cents extra per day. Cooks were to get $80 per month.

The City of Cobalt Mine accepted the nine-hour day and miners' schedule of wages, after its manager had signed the owners' agreement to refuse anything but their own schedule. The Board of Directors of the company took the matter in their own hands and decided to accept the men's terms. Their employes are returning to work. The Nipissing, Coniagas, Trethewey and Cobalt Lake mines are operating with partial staffs. The mine owners are recruiting Italian and other laborers in Montreal. To block this, the miners are circulating notices requesting all sympathizers to refuse employment in Cobalt. In this movement officials of the Western Federation of Miners, residents of the United States, are taking a most active part.

On July 17th Silver Leaf shipped a car of twenty tons, mostly high grade ore. McKinley-Darragh also shipped a care load, 42 tons of good ore.

ALBERTA.

Mr. D. B. Dowling, late of the Geological Survey of Canada, and at present in charge of a prospecting party sent out by German capitalists, has discovered coal not far from the Yellow Head Pass, where the Grand Trunk Pacific and Canadian Northern will probably cross the Mountains.

SASKATCHEWAN.

Regina.—Premier Scott has announced that while steps have been taken to reserve the coal lands discovered northeast of Eagle Lake for the benefit of settlers, nothing had been decided with regard to its development by the Government.

BRITISH COLUMBIA.

About twenty-five men are employed in the Cariboo-McKinney mine.

At Spruce Creek, Atlin, a discovery of large gold nuggets has been reported.

The skip service of Le Roi mine main shaft has been extended down in four compartments to the 1,650 foot level. A new wire rope has been put on the tramway and a new crusher installed.

The dam of the Bear hydraulic mine, Cunningham Pass, broke on June 27th, causing about $3,000 direct damage and putting a stop to all piping for the year. The building for the pilton wheel and dynamo was swept away and 160 feet of pipe line, 108 feet of sluice flumes and about 600 feet of ditch were lost. The stable also was destroyed. The loss of the season' water and the consequent stoppage of hydraulicking is, of course, the most serious loss. The dam was 38 feet high and was constructed of log cribbing, well brushed and heavily banked on the upper side with clay and gravel. The area of the water was about 1,000 feet in width by one and a half miles long. About 100,000,000 cubic feet of water was stowed behind the dam. The break was caused by the filling and embankment washing out.

Nelson, B.C.—A new mill is under construction at the Blue Bell mine, on Kootenay Lake, nearly opposite Ainsworth. The cement foundations are finished and the building is well under way. Ten Wilfley tables are to be installed. These are being built in Nelson by the Nelson Iron Works. It is probably that several tables of the Deister type will also be installed. The Deister is of moderate price and occupies less floor space than does the Wilfley. The mill is designed for the recovery of both lead and zinc. After going through the crushers and trommels, a recovery of lead is made in several sets of jigs. The zinc and iron middlings are then put through ball mills and finally over the concentrating tables, where a last clean separation of lead and zinc is made.

Grand Forks.—The Granby Company has officially announced its intention of largely expanding their whole plant. The new 100,000 gallon steel tank is half finished. When it is finished the foundations for the big steel flue chamber will be commenced. The blower building is to be remodelled. Other enlargements will necessitate more bin room and it is planned to enlarge the storage facilities until a capacity of 15,000 tons of ore and 6,000 tons of coke is reached.

Greenwood.—The labor trouble in the Greenwood mining district is over. Under the new agreement miners get $4 per day, sinkers $4.50 and laborers $3. Labor is very scarce.

The Granby Consolidated are keeping up their shipments to an average of 2,000 tons of ore per day. The British Columbia Copper and Dominion Copper are also pushing development. At the Phoenix mines of the Granby and Dominion Companies very active development is being carried on.

In Lardeau mining division the management of the Eva gold mine are preparing for the erecting of a 100 stamp mill. Twenty stamps are now dropping. The Eva is a dividend-paying mine. On the Silver Cup about sixty tons of ore per month is being shipped. The shaft is down 800 feet. On the Beatrice, a silver-lead property, work has been resumed, and the erection of a tramway is being considered. The Silver Dollar Mine has finished erecting a 40 stamp mill.

The Similkameen Mining & Smelting Company is driving a 500 foot tunnel at its Bear Creek mine in the Similkameen valley. The tunnel will, it is expected, open up a large body of low grade ore and will largely increase the output of the mine.

YUKON.

A. Chester Beatty, one of the chief engineers of the Guggenheim Exploration Company, states that the company now controls ten miles of Bonanza Creek, fifteen miles of tubularies and about eighty million yards of hill gravel claims.

MINING NEWS OF THE WORLD

GREAT BRITAIN.

The output of the Cornish tin mines for the first six months of the present year is valued at £295,594, on a tonnage of 2,504 3-4 tons. The avearge price of metallic tin has been in the neighborhood of £190 per ton, a considerable advance over last year's prevailing prices.

It is interesting to note, meanwhile, that one Cornish mine, the Levant, worked since 1820, has to date accomplished the remarkable achievement of having paid in dividends no less than 50,000 per cent. upon its original subscribed capital.

The establishment in Cornwall of a central school of mining and metallurgy is now receiving the consideration of the Board of Education.

FRANCE.

A bill has been passed by the Chamber of Deputies constituting eight hours a maximum day's work in mines. The bill was adopted on a vote of 427 to 123.

UNITED STATES.

Except for a shortage of miners in Colorado, which still continues to occupy the premier position among the gold-producing States of the Union, conditions are eminently satisfactory, and more activity is being displayed than at any previous period. This includes not only the development of new mines, but the reopening of old abandoned properties, which now, however, thanks to the appreciation in the values of metals and improvement in mining and metallurgical methods, may be worked at a profit. The immense water power to be derived from the mountain streams of Colorado is, moreover, being turned to account and important electrical power plants are being installed with a view to supplying energy to the mines and replace steam.

The report of Mr. Argall, the manager of Stratton's Independence, was presented at a recent meeting of shareholders in London. The report stated that there were 600,000 tons of ore on the dump, averaging in value $3.60. It was expected to save 70 per cent., or $2.52 per ton, of these values at a cost of $1.52. When Mr. Argall's plan for treating the low grade ore left in the mine is put into practice, profits from this and other sources are expected to realize between £40,000 and £50,000 per annum.

For the first six months of 1907 the Utah mines distributed profits aggregating over three million dollars.

Many important new discoveries are reported to have been made this year of iron ore on the Mesabi range. It is also expected that production from the area will show a further increase this year.

AUSTRALIA.

At the opening of the Parliament of West Australia, the Governor in his speech from the throne took occasion to refer to the prosperous condition of the mining industry of the country which, he showed, had already produced gold, copper and tin to the value of £76,000,000, while nearly £16,500,000 in dividends had been paid by the mines.

In the Orange district of New South Wales a number of mines worked for copper some thirty-five years ago and then abandoned are about to be reopened. Two of these properties are already in successful operation.

Some fine diamonds have been taken recently from the Yowah field in Queensland, near the New South Wales border.

WEST AFRICA.

The official report on mining in the Gold Coast and Ashanti for the year 1906 has been issued, and shows a gold production of 210,111 ounces, as against 153,959 in 1905.

SOUTH AFRICA.

The Johannesburg correspondent of *The Mining Journal* (London) anticipates a considerable reduction of costs on the Rand during the next two years, and, he states, the strike of the white miners will assist towards that end. The strike is meanwhile still in progress and there have been several demonstrations.

An association of coal owners has been formed in the Transvaal with the object of putting a stop to the cutting of prices. The whole of the output will be dealt with by the association, the prices being fixed in the respective districts by the calorific value of the coals.

According to statistics compiled by Mr. Ross E. Browne, the general average costs of operating mines on the Witwatersrand is as follows: Developing, 1.659 shillings per ton; mining, 11.980 shillings; milling, 3.084 shillings; cyaniding, 2.904 shillings; total, 19.627 shillings; average number of comparison tons per month, 16,961.

New Companies

Empire Cobalt Mines, Limited, $3,000,000, Cobalt.

Cobalt Silver Bell Mines, Limited, $8,000,000.

The Cobalt-James Mines Company, Limited, $250,000, Toronto.

COMPANY NOTES

At the eighth annual meeting of the North Star Mining Company, Limited, held in Montreal on June 26th, a net profit of $27,000 was reported on the year's operations. The company's mines are situated near Cranbrook, B.C.

One hundred thousand shares of Cobalt-Foster treasury stock will be issued at 75 cents per share of one dollar par value. The allotments will be made on the basis of one share of new stock for nine of old, to shareholders of record of July 10th.

A writ has been entered against the firm of H. Harlan & Company and A. B. Harlan, of Toronto, by J. T. Eastwood. A court order is asked, to compel the defendants to account for all profits in connection with the Leith-Nipissing Silver Cobalt Mining shares.

The O'Brien Silver Mine of Cobalt paid the Provincial Government the sum of $116,000,546.31 on July 16th. This is the royalty due the Government for the quarter ending July 1st, 1907. The Government receives twenty-five per cent. of the total output of the mine at the pit's month.

STATISTICS AND RETURNS

The output of the Crow's Nest collieries for the week ending July 12th was 24,015 tons; daily average, 4,002 tons.

DOMINION COAL COMPANY.

Cobalt ore statement for the week of July 7th to 13th, 1907:—

July 8th, C.P., 4090, Coniagas Mine, American Smelting & Refining Company, Per Amboy, N.J., 62,000; $99.20.

July 8th, C.P. 56748, Coniagas Mine, American Smelting & Refining Company, Perth Amboy, N.J., 62,000; $99.20.

July 8th, C.P. 38742, Coniagas Mine, American Mining & Refining Company, Perth Amboy, N.J., 65,520; $104.82.

July 10th, C.P. 21794, Coniagas Mine, American Smelting & Refining Company, Perth Amboy, N.J., 65,690; $105.10.

July 11th, N.Y.C. 46953, Coniagas Mine, American Mining & Smelting Company, Perth Amboy, N.J., 64,000; $102.40.

July 10th, Soo 21524, Foster Mine, Canadian Copper Company, Copper Cliff, Ont., 52,000; $72.80.

July 11th, G.T. 8284, Buffalo Mine, Charles L. Dennison, New York, N.Y., 60,000; $96.00.

July 11th, L.V. 83038, McKinley-Darragh-Savage, McKinley-Darragh-Savage Manufacturing Company, Newark, N.J., 80,000; $128.00.

Grand Ttotals—511,210; $807.52.

British Columbia.—For the week ending July 6th the following shipments of ore were made in the districts named:—

	Week. Tons.	Year. Tons.
Boundary shipments	36,573	539,685
Rossland	5,988	138,983
Slocan-Kootenay	2,803	64,509
Totals	45,364	743,177

Granby, it is figured, will lose $598,170 as a result of the 3-cent-a-pound reduction in the price of copper. Calumet and Hecla will drop $3,000,000, and Amalgamated Copper no less than $6,000,000.

The following shows what the 3-cent reduction in the selling price means to each concern, as well as the earnings per share on 25-cent copper, and the loss sustained by each share on account of the price reduction.

	Red'n by 3c dec.	Earn per share.	Loss per share.
Cal. and Hecla	$3,000,000	$170.00	$30.00
Tamarac	420,000	25.00	7.00
Quincy	585,000	26.00	5.85
Osceola	557,654	26.00	5.80
Cal. and Arizona	1,124,109	30.00	5.62
Wolverine	290,451	30.00	4.84
Granby	598,170	18.00	4.43
Amalgamated	6,720,000	20.00	4.36
Mohawk	280,567	13.50	2,81
Copper Range	970,589	13.00	2.53
North Butte	985,977	15.00	2.46
Anaconda	2,848,915	12.00	1.85
Utah Cons.	556,019	12.00	1.85
Shannon	358,920	5.00	1.20
Butte Coalition	749,853	4.50	.75
Total	$20,046,224		av. $5.46

New Dividends

The directors of the International Coal & Coke Company have declared a quarterly dividend of 1 1-2 per cent., payable August 1st, to shareholders of record July 15th. This is an increase of 2 per cent. per annum over the former dividend, and means a disbursement of $42,000, or at the rate of $168,000 per annum.

METAL, ORE AND MINERAL MARKET

Aluminium, No. 1 grade ingots—45 to 47 cents per lb.
Antimony—10 to 14 cents per lb.
Arsenic, white—7 1-2 to 7 3-4 cents per lb.
Barytes, crude—$11.25 to $14.50 per short ton.
Bismuth—$1.50 to $1.75 per lb.
Cadium—$1.40 to $1.46 per lb.
Carbons for drills—$78 to $85 per carat.
Carborundum, powdered—8 cents per lb.
Chronium, metal pure—80 cents per lb.
Cobalt, f.o.b. Cobalt, Ont., unrefined—35 to 50 cents per lb.
Corundum—7 to 9 1-2 cents per lb.
Feldspar, ground—$12 per short ton.
Flourspar, lump—$10 per short ton.
Graphite, domestic—$50 to $150 per short ton.
Gypsum, lump—$4.50 per long ton.
Infusorial earth, ground—$25 to $30 per ton.
Lead—5.25 cents per lb.
Manganese, pure metal—75 cents per lb.
Mica, ground—$80 per short ton.
Mica, scrap—$15 per short ton.
Molybdenum, pure—$1.70 per lb.
Mlybdenite ore, 95 per cent. pure—$4.50 to $5 per unit.
Nickel—45 to 50 cents per lb.
Platinum, ordinary metal—$26 per ounce.
Platinum, scrap—$20 to $21 per ounce.
Pyrite, 38 per cent. to 45 per cent. sulphur, lump, 10 1-4 to 11 1-2 cents per unit.
Quicksilver—$41 to $42 per 75 lb. flask.
Talc—$18 to $23.50 per ton.
Tungsten, pure metal—$1.25 per lb.
Tunsten ore, 60 per cent. pure—$400 per ton.
Tin—40 1-4 cents per lb.

MARKET NOTES.

Spelter.—Market is dull, despite lower prices. Now York 6.05 cents per lb.; London, £24 per long ton.

Lead.—The London market is weak, otherwise there are no changes of note. New York, 5.25 cents per lb.; London, £20 for Spanish lead.

Tin.—Tine is decidedly weaker. New York, 40 1-4 cents per lb.; London, £183 for spot.

Copper.—Reduction in prices has not encouraged business. The market stands, New York, electrolytic, 20 3-4 to 21 1-4 per lb.; lake, 21 1-2 to 22 cents; London, £94 for spot.

Silver.—July 5th, 67 3-8 cents per ounce; July 6th, 67 3-8 cents per ounce; July 8th, 67 5-8 cents per ounce; July 9th, 67 3-8 cents per ounce; July 10th, 67 1-4 cents per ounce; July 11th, 67 3-8 cents per ounce; July 12th, 67 1-2 cents per ounce; July 13th, 67 3-8 cents per ounce; July 15th, 67 5-8 cents per ounce; July 16th, 67 7-8 cents pe rounce; July 17th, 68 1-8 cents per ounce. Mexican dollars, 52 7-8 cents.

The ore receipts and lead contents in pounds from Hall Mining & Smelting Company's Slocan mines for the first five months of the current year are given below:—

	Ore.	Lead.
January	883,207	299,197
February	2,433,461	883,845
March	4,516,382	2,041,103
April	413,344	182,401
May	2,554,681	1,321,808

A mining deal that will mean a great deal for the development of the mining resources of the district around Port Arthur, Ont., has been closed. R. J. Anderson, of Minneapolis, has purchased from J. W. Andrews his lead property in Dorion Township, consisting of 316 acres. It is said to be very rich in lead. Mr. Anderson has had men at work for a week prospecting. It is the intention of Mr. Anderson and his associates to develop the property on a large scale. Already 20 men are at work mining ore and this number will be increased. Roads are being cut into the property from the railway track, and it is the intention to erect a smelter at the mine as soon as possible.

We have received from Merralls Engineering, Limited, 1123 Broadway, corner 25th street, New York, copies of their several catalogues. Merralls Engineering, Limited, have a factory in Ottawa, Ont. Hence, they are prepared to fill Canadian orders promptly. Their specialties are their stamp mills, described in this column recently, and the "Record" Vanner. Their six stamp mill (double three stamp battery) will handle 40 to 50 tons per day at approximately 20 horse-power. The "Record" Vanner has a new panning or jerk motion and a long, adjustable stroke. It makes a clean separation and a selective delivery of all mineral particles.

WANTED

Mining Graduate (McGill) desires a position in Cobalt or vicinity as Superintendent or Foreman with reliable Mining Company. The applicant has had several years in Montana in the practical work of Mining and Concentrating. At present he is Superintendent of a Mining Company.

Address :—"Montana,"
c/o Canadian Mining Journal.

MINING PROPERTIES WANTED.

Prospectors and others wishing to dispose of Mining Claims or undeveloped Mines in Ontario or Quebec, can communicate full particulars to the address below.

The properties will be examined by competent mining engineers, and if satisfactory, arrangements will be made to buy the same.

Address, General Post Office, Box 481,
Toronto, Canada.

MINE WANTED

Developed gold, silver or copper, lead. Send maps and reports Will promptly return same if property not suitable.

PROSPECT WANTED

Will develop first-class prospect for controlling interest. Would buy under bond and lease. Prefer large, low-grade dedosits. Describe fully. State price and terms. Will promptly return papers.

J. B. SPERRY, 18 BROADWAY, NEW YORK

IRON AND PYRITES CLAIMS FOR SALE

Several undeveloped iron claims and several partially developed pyrites claims, within one mile of line of Canadian Northern Railway, 50 miles west of Fort William ; and an undeveloped copper and silver claim near Nipigon, for sale.

Particulars P.O. Box 512, Fort William, Ont.

WANTED AT ONCE.

Young mining graduate with some practical experience to do some work in the province of Ontario. Apply at once to

Fritz Cirkel, M.E., 80 Stanley St., Montreal

MINES AND STOCK FOR SALE

Four Copper Mines assaying high in silver and gold. Nickel Mine running about $68.00 to the ton in silver and situated twelve miles from Sturgeon Falls. Assays and mines can be seen at any time. Also a few thousand shares of Nipissing Copper and Silver Co., Limited. Apply to

R. Niffin, Smoky Falls, Ont.

MINING MACHINERY FOR SALE

Splendid opportunity to secure some good machinery far below the price of new and all or any part of it can be delivered on the cars in one week.

One Class D Rand Cross Compound Condensing Duplex Air Compressor having a capacity of 835 feet of free air and will run 10 No. 2 Rand Drills. High pressure steam 14 x 24, low 22 x 24, air cylinders each 14 x 22. Has Myers' patent steam cut off valves and machanically operated air valves. Machine good as new.

One double cylinder, 10 x 16, Lidgerword Hoisting Engine. Drum, 54-inch diameter and holds about 700 feet of wire rope without overlapping. End friction and friction hand break. This machine is as perfect as the day it left the shop.

Lots of Steam Pipe ranging from 2 to 5 inches.
Light Steel Pit Rails about 14 pounds.
Steel Piping Tools from 2 to 5 inches.
One Heavy Duty Steam Mining Pump.
One Northy Duplex Steam Boiler Feed Pump.
Rand No. 2 Rock Drills and Barrs.
Rock Drill Steel ready for machines and in good lengths.
One 15 H. P. Steam Engine.
One 25 H. P. Steam Engine.

These engines would be just the ones for a saw mill or could be used as a pumping engine for a mine. Steel Ore Car Bodies just the thing for underground work. This lot of odds and ends will be sold low for cash.

For particulars address, G. M. this paper.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

NEW ONTARIO EXPLORATION COMPANY LIMITED
SAULT STE. MARIE, CANADA

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

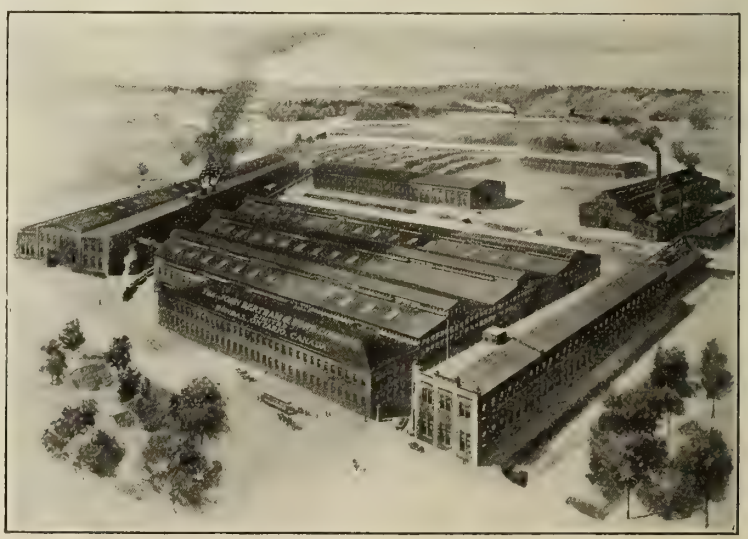
PAROID ROOFING

"The Test of Time is the Test that Tells."

Before buying roofing for your coal shed, power house or mine buildings, get our story on Paroid Roofing.

Don't be confused by the many and puzzling claims of some roofing manufacturers.

When a roofing is the accepted standard of Governments, railroads, manufacturers, mine owners and farmers everywhere, it means something. It means quality and service.



Only one way to tell the real value of any roofing. That's the test of time—the test of actual wear and service. Paroid has stood that test in every respect. What Paroid has done for others it will do for you.

Paroid is weatherproof in heat or cold; will not melt or run in summer, nor crack and freeze in winter; is absolutely unaffected by fumes, dampness or gases; is spark and cinder proof.

Paroid is the only roofing with rustproof caps. These are square and waterproofed on both sides, They hold firmer and cannot rust out like ordinary causing leaks.

Anyone can lay Paroid. Full directions and necessary materials are packed in each roll.

Send for free sample and our booklet "Paroid Proofs."

PLANT OF BERTRAM & SON, HAMILTON, ONT.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class	**$80.00 to $500.00**
2nd "	**45.00 and 47.50**
3rd "	**28.75**

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre;

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres for one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers kindly mention this Journal.

Dominion of Canada

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

UNDERWOOD

The increase in Underwood sales this year has been over 100 machines a month. For any other typewriter this increase would be considered exceedingly satisfactory as total sales.

The Underwood Billing Typewriter has been sized up by business men as the greatest economiser and systematizer of office work ever produced. A large financial institution recently placed an order for forty, and in a few days duplicated the order.

Let us send you the book about the Biller.

United Typewriter Co., Limited, 7 Adelaide Street East, Toronto

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8 50. Special to readers of this paper **$5.00**

1,000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper ..... **.90**

500 Working Jackets, of striped moleskin and duck in khaki, brown and slate. Regularly $2.00 apiece. Special to readers of this paper **$1.25**

Underwear, Shirts, etc.

Men's Heavy Scotch Wool and Fleece Lined Underwear, guaranteed unshrinkable, non-irritating, overlocked seams, elastic ribbed cuffs and ankles. Sizes 34 to 46 Regular value, 90c. garment, per garment ..... **.69**

500 Men's Heavy Khaki Duck Mining Shirts, collars, pockets, have patent fasteners, large roomy shirts, wind and rain proof. Sizes, 14 to 17½. Special ..... **.89**

Men's English Cardigan Jackets and Golf Coats, three pockets, guaranteed all worsted, fast color. Sizes, small, medium and large. Regular value $4.00 and $5.00. Each **$2.98**

Men's Heavy Elastic Web Suspenders, strongly sewn, made with unbreakable cast off leather ends, Police-Firemen style. Our price 50c. Each ..... **.39**

Men's Heavy Tweed Shirts with collar and pocket, generously made, double stitched throughout, also a few heavy Mackinaws and black Drills in the lot. Sizes 14 to 18. Regular value, $1.25, $1.50, $1.75, $2 00. Each.. **.89**

Sullivan Rock Drills

For all classes of mining work Sullivan Drills are the most rapid and the most economical of power and of repair.

The hard blow of the drill makes progress rapid in solid rock, while in broken ground the powerful up-stroke and ratchet movement prevents the loss of holes through rifling.

Our iliustration shows portion of a group of 24 Sullivan Drills excavating The Bas Obispo Cut, on the Panama Canal.

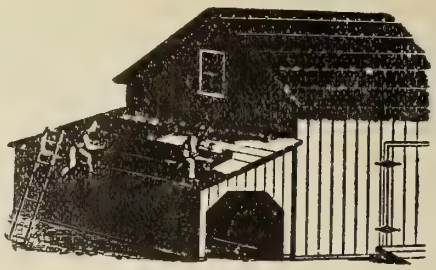
Amatite ROOFING

THE MINERAL TRADE B MARK **SURFACED ROOFING**

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expenses of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended

The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much



Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

Leading Features of a Good Rock Drill

No. 2.—THE VALVE MOVEMENT

The distinguishing characteristic of the "Rand" drill is the positive character of its valve movement. There is no lost motion, no incomplete travel, no fluttering of the valve, no uncertainty in the machine movement. When steam or air is admitted to the cylinder the piston must move; and when the piston moves, the valve must be thrown.

The piston does not strike the rocker. It simply slides under it gently and pushes it up.

The rocker is reversible and cannot be put in wrong.

The valve is held to its seat by live pressure on its upper face and thus only wears tighter with continued service.

The forward stroke is slightly cushioned, giving life and speed to the blow.

The Tappet drill is the pioneer of rock drills, and the Rand "Little Giant" is the finished refinement of the original type of the Tappet drill.

For further information apply to nearest office.

THE VISIT OF THE AMERICAN INSTITUTE OF MINING ENGINEERS TO ONTARIO.

The Ontario Provincial Government, animated by a desire to further the mining interests of this Province and wishing, also, to give the representatives of a world-wide institution a more or less definite idea of the richness and variety of Ontario's mineral deposits, invited the American Institute of Mining Engineers to visit Toronto and to make a tour of certain important mining districts. The various towns visited vied with each other in welcoming the visitors. In every respect the visit was a phenomenal success.

THE CANADIAN MINING JOURNAL wishes to congratulate the Local Government upon its wise liberality. Such enlightened acts denote a spirit refreshingly beyond and above the dark realm of party politics. The invitation was extended with the sole objects of rectifying current erroneous ideas and of indirectly advertising the mines and minerals of Ontario. That much good will result need not be doubted for a moment. But too much must not be expected. The visiting engineers are, as a body, keen, observant and hard-headed. They did not gush, nor were they expected to. Each of them, however, will in future have a much fairer conception of what Cobalt signifies. Many of them, who had not visited Copper Cliff before, have now some conception of the magnitude and promise of that nickel-copper industry. In Moose Mountain the visitors will recognize that the hem of what may prove a vast iron ore range has been touched.

Lest any of the recent visitors should carry away the impression that Ontario stands alone in her mining possibilities, it may not be unwise to point to the coal, iron and gold of Nova Scotia, the oil shales and copper of New Brunswick, the asbestos, graphite, mica and chrome ore of Quebec, the coal and oil of Alberta and Saskatchewan, and the unrivalled variety and wealth of British Columbia's minerals. These things we mention because it is not improbable that a special view of one or two sections of Ontario may tend to destroy the perspective when looking at the Dominion generally. This, however, is a digression.

One result of the visit will be that the mining men of Ontario will continue their work with a lessened dread of the evil effects of stock manipulators.

We publish in this issue a letter from Mr. Alexander Gray, formerly editor of *The South African Mines, Commerce and Industries,* of Johannesburg. Mr. Gray is soon to move to Canada.

THE COBALT STRIKE

In justice to the more responsible of the miners at work in Cobalt before the strike was declared, it must be said that the strike was evidently forced upon them. The representative of the Western Federation, carrying with him the prestige of that Union, flushed with a sense of his power and eager to enlighten the ignorant, though happy, victims of the tyrannic mine owners, appeared upon the scene of peace and plenty. Before his lusty educative efforts were put forth, not a single complaint had been heard. On the other hand, the camp was overflowing with well-fed, well-paid miners. Considering the tender age of the mines and the fact that even yet the camp as a whole is not self-supporting, the wages paid were very high. In no other metalliferous mines east of British Columbia are wages as high. The food is, in our own humble opinion, not to be excelled anywhere.

It is not therefore evident, or, at best, it remains to be proved, that the miners had any substantial reason for attempting to tie up the camp.

In discussing any of these clashes between employer and employe, it is difficult to preserve that spirit of impartiality which is so essential to the furthering of peace and progress. The heat of debate, the friction of contending factions and the incidental losses of time and money do not induce a calm and judicial spirit. Yet, in fairness to the workmen, it is well to remember that labor organization have accomplished a vast deal of specific good. On the other hand, certain of these organizations have developed an aptness for abusing their powers. And, lastly, it is high time that Canadian workmen managed their own affairs. They gain nothing by the help of the Western Federation. The very name of that organization stands for methods for which Canadian workmen should be the last to subscribe.

The Cobalt strike has failed because it did not deserve success. The leaders of the Western Federation appear to be surcharged with the desire to precipitate collisions between labor and capital. They did not, in this instance, work up even the color of an adequate excuse. For this they merit condemnation. But, though this attempt failed, there is no reason to doubt that similar attempts will be made in the near future.

It is the duty, not only of Canadian operators, but of Canadian workmen, most especially of Canadian miners, to avoid utterly any measures which bring upon the country loss and discredit. Industrial disputes can and must be settled without the costly strike. It is incumbent upon mine operators to see that good feeling and mutual respect are fostered as between themselves and their employes. Repressive measures are offensive and stupidly ineffective.

Employers and employes generally should prove themselves much more amenable to reason and should observe the letter and spirit of arbitrators' awards with decidedly greater strictness.

ALBERTA MINING CONDITIONS

The report of the Alberta Coal Mines Commission is soon to appear. The points with which the Commission's report will largely deal are the eight-hour day and the question of compensation.

The eight-hour "bank to bank" day is strenuously objected to by a majority of the operators. If the eight-hour day were fixed as the actual time occupied by the miner at his work, the operators would offer no objection. But when the eight-hour day is defined as including the time necessary for the miner to reach his work in the mine and that required to reach the bankhead again, the operator becomes subject to very considerable loss.

This "bank to bank" eight-hour day, more especially in older mines whose workings are extensive, implies a diminution in output which should in justice be met by a reduction in the men's pay.

The report of a similar British Commission, commented upon recently in these columns, demonstrated that a nine or eight-hour day is only nominally such. The actual hours worked in any coal mine are uniformly less than the hours paid for.

MINERS' ANEMIA

Mr. F. W. Gray writes, in this number of THE CANADIAN MINING JOURNAL, on a subject which, in all probability, will be new to most of our readers. Ankylostomiasis, or "miners' anemia," is by no means confined to coal miners. "Broadly speaking, the parasite will be found to occur normally on either side of the Equator, between the fortieth parallels. Within these limits the disease may be endemic and the population may be affected as a whole." Beyond these limits the disease may occur in epidemic form, especially when industrial operations create an artificial environment favorable to the propagation of the parasite. Thus, large brick kilns; hot, moist, unsanitary mines; and deep tunnels may become breeding grounds for these noxious organisms.

Applying the results of European research to Canada, Mr. Gray points out that, while in no sense are our coal mines (especially those of Cape Breton) to be regarded as possessing what is termed a "disposition" to infection, still, on account of the large number of European miners now employed in Canadian coal mines, the possibility of a serious epidemic should be guarded against.

The completeness, the elaborateness and the effectiveness of the campaign carried on by the German provident society, Knappschafts-Verein, under Government supervision, against the spread of ankylostomiasis, arouses unreserved admiration and no small degree of amazement. In striking contrast is the situation in Belgium, where the ignorance and prejudice of the affected classes have been allowed to deter the work of eradication. France, England and the United States have

seriously grappled with the problem of eliminating this loathsome infection. Canada may have to face the problem at any time.

PORT ARTHUR'S NEW INDUSTRY

The blast furnace of the Atikokan Iron Company was blown in about the middle of July. The presence of a modern and well-equipped plant, in so well-situated a locality as Port Arthur, should encourage the exploitation and development of iron ore deposits in all the adjacent districts. A strong iron industry is a pre-requisite of the normal growth of our material prosperity. A successfully operated blast furnace in Port Arthur will give a strong impetus to the opening up and settlement of new territory and will increase most appreciably the importance of the town itself.

NOVA SCOTIAN ENTERPRISE

The economy of generating power at the coal pit mouth and distributing it in the form of electricity to industrial centres has long been evident. It has remained for a comparatively small colliery in Nova Scotia to put the idea into practice. At the collieries of the Maritime Coal, Railway & Power Company, situated in Chignecto, N.S., a large installation has recently been completed and put in operation. The progressive town of Amherst will be the principal consumer of the power generated at the collieries. The men who conceived and made actual this enterprise are deserving of sincerest praise.

EDITORIAL NOTES

The iron ore deposits of Ontario have been the objects of sporadic attention in the past. Fitful attempts have been made to exploit them. At Sault Ste. Marie, at Midland, at Hamilton and at Deseronto pig iron and steel have been manufactured for some years largely from imported ores. At Port Arthur the new Atikokan blast furnace is in operation. Thus Ontario may boast of a fair start in the iron industry. But vast fields of iron ore still lie untouched. In Northern Ontario deposits of great promise exist. In Eastern Ontario proved bodies of ore are found in places favorable for shipment to a lake port. Limestone there is in abundance. There are several points on Lake Ontario where iron ore, limestone and coke could be assembled at prices well within commercial limits. Rich as Cobalt is, it will play no such part in the future of this Province as will the iron ores.

On another page the Secretary of the Canadian Mining Institute replies to our editorial of August 1st. We do not wish to make extended comment upon any of the points raised until further discussion has taken place. But it must be borne in mind that our suggestion was constructive and not destructive. To our mind the Institute can be made more useful. We hope that all concerned will look upon the question from the point of view of the Institute. The matter of personal feeling, so far as THE CANADIAN MINING JOURNAL is concerned, will not be allowed to affect the question in the slightest. We fear, however, that the ardour of the Secretary has led him somewhat far afield. The merits or demerits of the executive are not under discussion. The various officers of the Institute are worthy and blameless men. But the Institute, as a corporate entity, does not take as active a part in mining affairs as many of its members desire it should.

TWO SPECIMENS AND THEIR BEARING ON THE GOLD MINING INDUSTRY OF NOVA SCOTIA.

By E. PERCY BROWN, S.B.

The photographs on the cover of this issue of THE JOURNAL illustrate two specimens of gold ore as found in Nova Scotia.

If the reader will carefully compare the photographs he will be able to appreciate what the writer considers is one of the chief reasons why the gold mining industry of Nova Scotia occupies the position that it does to-day.

The specimen on the left is a typical example of what is generally regarded as characteristic of Nova Scotia gold ore.

It is unfortunately a fact that the average miner of this Province, even to-day, pays little attention to any other class of ore. He believes that his eyes are the best guide as to the value of any ore, and, as he expresses it, he wants to see the gold sticking out of the rock. Further than this, the Government of Nova Scotia, by exhibiting just such specimens of gold ore as this wherever the ores of the Province are shown, tend to impress this very point upon the minds of the mining public the world over. The consequence is that when one hears or sees a reference to gold mining in Nova Scotia he finds that it is classed as hazardous and uncertain, and the deposits are said to be pockety.

The second specimen, showing merely some mineral (arsenopyrite) distributed through a dark blue quartz and slate, represents what is generally known as low grade ore. It is unattractive to the ordinary miner, who views with suspicion the man who tells him that such ore is worth $6 per ton. If he does believe the statement he interprets it to mean that a large amount of capital would be necessary to work such an ore and that

ordinary free milling practice would not save enough of the values to make a paying proposition.

Now what are the facts regarding the comparative value of the ore represented by the two specimens?

Both come from the same vein or belt. That portion of the belt from which specimen No. 1 is taken averages in value from 50 cents to 75 cents per ton and does not pay to handle. The specimens are of course very pretty in themselves, and if there were enough of them the ore would be all right, but it is sometimes a long way between the specimens, and that portion of the belt carrying the gold is but a small fraction of the whole and it is impossible to separate it by sorting, so that as a sound business proposition this portion of the belt is a failure.

Specimen No. 2 comes from a portion of the ore body that has yielded an average return by free milling alone of $5 per ton, and an extra 50 cents or 60 cents by further treatment.

Can there be any question as to which is the more profitable ore?

I believe that if this so-called "low grade" ore were thoroughly exploited throughout the Province that mining would assume a very different aspect.

It may be doubted in some quarters that there is a profit in handling ore yielding $5 per ton in a small mill, say 10 or 20 stamps. This can be answered by stating that on a certain property in Nova Scotia a large inclined shaft 10 by 12 feet is being sunk on the ore body at a cost of $12 per foot, one air drill being used. This cost covers all expenses underground except timbering, the cost of which is very small. This does not include the cost of hoisting and the power for drills.

It may thus be seen that sixteen tons are mined at an expense, outside of the items stated, of $12, or 75 cents per ton. Any mining man can judge whether or not a yield of $5 per ton under such circumstances would cover all expenses and leave a margin of profit, even as a ten stamp proposition.

The Toronto Meeting of the A.I.M.E. Visit to Cobalt and other Mining Districts.

In our last issue an outline was given of the meetings of the Institute to Toronto on the 23rd and 24th July. The visiting members, together with representatives of the Ontario Government and a considerable number of Canadian mining engineers and press representatives, left Toronto on the evening of the 24th on a special train for the Cobalt district. The special train consisted of ten Pullman cars and two diners. The party numbered about two hundred.

The Hon. Frank Cochrane, Minister of Mines, took official charge of the visitors. He was assisted by the Hon. Dr. Pyne, Minister of Education, and by the Toronto and various other local committees.

On arriving at Cobalt the party was met by the following committee: Mr. A. A. Cole, representing the T. & N. O. Ry.; Messrs. R. W. Leonard and D. B. Rochester, from the Cobalt Chamber of Mines; Messrs. Running and Martin, from the Cobalt City Council; Messrs. McLeod and Farland, from the Township Council of Coleman, and by a special committee to guide the occupants of each car through the leading mines. The party was divided into sections, each section visiting four or five mines. Camp dinners were served at the Coniagas, Nipissing and Cobalt Central Mines.

New Liskeard was reached at 8 p.m., and his Worship, Mayor Blair, at the head of a deputation, read an address of welcome. Headed by a band, the visitors then proceeded to the steamer "Meteor," and the evening was spent in a moonlight excursion on Lake Temiskaming. Speeches were made on the return trip.

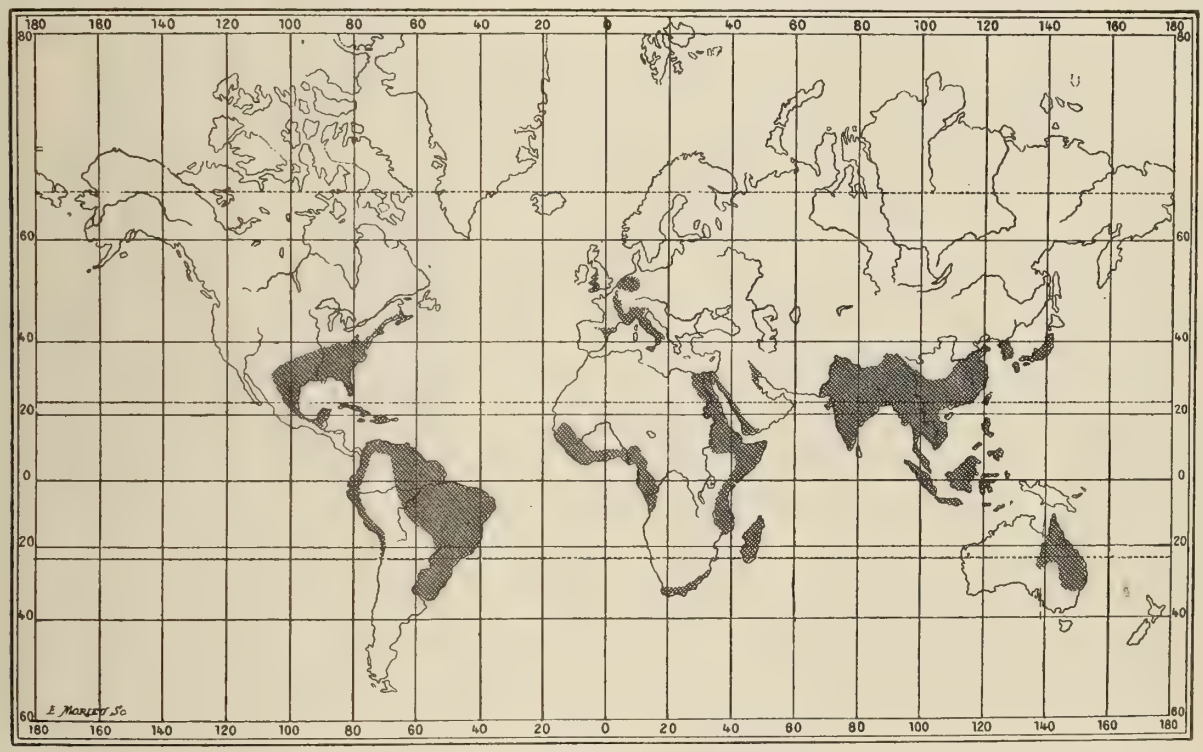
On the morning of July 26th Cobalt was again visited. In the afternoon an excursion was taken on the steamer "Meteor" from Haileybury. On the return of the "Meteor" the members of the Haileybury Club entertained the delegates. Dinner was served in the grill room, and the evening was devoted to speech-making, interspersed with music.

The special train left Haileybury for Temagami (about 36 miles south) early on the morning of Saturday, July 27th. The deposit of iron ore near the station was inspected. In the afternoon the steamer "Bell" was boarded, and the visitors were taken up the beautiful Lake Temagami. At Temagami Inn (12 miles up the lake), and at Lady Evelyn Hotel, on Lady Evelyn Lake, Sunday was spent quietly.

Sudbury was reached on Monday morning, where the Sudbury Local Committee met the train. At the invitation of the Canadian Copper Company, their plant at Copper Cliff was inspected, and the Creighton Mine was visited. At the latter place a camp dinner was served. In the evening a complimentary banquet was tendered to the Institute by the citizens of Sudbury. Lennon's Opera House, in which the dinner was held, was superbly decorated for the occasion. Covers were laid for 250 guests. Many notable speeches were made in response to the toasts.

On the following day the Moose Mountain Iron Mines (30 miles north of Sudbury) were visited. Here also a typical camp meal was enjoyed, under a temporary roof erected for the occasion. In the afternoon the Vermilion placer gold workings were the object of brief inspection. At North Bay many of the party left. The return to Toronto was marked by a mock trial and by an unpremeditated expression of appreciation to the Hon. Mr. Cochrane by the American delegates.

Space will not permit of reference to many of the pleasant features of the trip. The citizens of Cobalt, New Liskeard, Haileybury and Sudbury spared no pains to extend the heartiest possible welcome to each and all of the delegates. The O'Connor Steamboat Company most courteously put their steamers at the disposal of the visitors on Lakes Temagami and Lady Evelyn. At Cobalt the Local Committee presented the whole delegation with brooch pins of native silver. Incidentally, the silver was supplied by the Trethewey Mine.



It was the intention of THE CANADIAN MINING JOURNAL to publish in this number a much fuller account of the meetings and itinerary of the American Institute's Ontario visit. To that end a full stenographic record was made covering all the proceedings and speeches, both in Toronto and at the other points visited. Owing to pressure upon our columns it has been found quite impracticable to utilize more than a small fraction of this material. It has been decided, however, to publish within the next few weeks a compendious handbook. In this will be included historical sketches of the mining districts visited, portraits of the discoverers and pioneers of the mining camps and a full account of the whole proceedings. The volume will be copiously illustrated, both with color plate and with half-tones.

ANKYLOSTOMIASIS

"Miner's Anemia."

By F. W. GRAY.

The mining population of Europe, particularly that portion engaged in coal mining, has suffered considerable pecuniary and physical inconvenience from the prevalence in recent years of a disease variously known as ankylostomiasis, miners' anemia, hookworm disease, etc. Unfortunately, this disease has been given a name of portentous length that unfailingly excites the risibility of mining men who have never come into contact with the "unspeakable worm." The English miners named the disease "hanky-panky," and their bantering attitude has been reflected in other mining districts by men who should have known better, for in many places experience of the ankylostome has been dearly purchased, and could have been avoided had due regard been paid to the warnings of medical men, and had any regard at all been paid to sanitary conditions underground.

Geographical Distribution of Ankylostomiasis

The following notes have been collated from various sources, chiefly European, as the result of somewhat extended reading on the subject. They are written purely from the standpoint of the mining engineer, and it is solely the fact that in the nature of things so few members of the medical profession have any intimate acquaintance with the technics of mining or actual physical conditions underground, that the writer has ventured on a subject so very largely medical, but which, from its intimate connection with and its dependence on local conditions and systems of coal extraction, and from its serious effects on the health and general prosperity of the miner, very largely appeals to the mining engineer, and should be of vital interest to the mining industry in general.

The subject is comparatively new in Canadian mining circles, and a recapitulation of what has happened in European coal districts may serve to put us on our guard against the introduction of ankylostomiasis infection into our coal and ore mines. This is not at all a far-fetched possibility, when we consider the steadily increasing tide of European immigration that is now setting towards our Dominion, and further that our mines are but in their infancy.

Recent literature on the subject of ankylostomiasis in the English language is not very extensive, as the subject has not yet been so forcibly brought to the attention of either England, Canada or the United States as it has been in France, Germany, Belgium, Italy and other European countries.

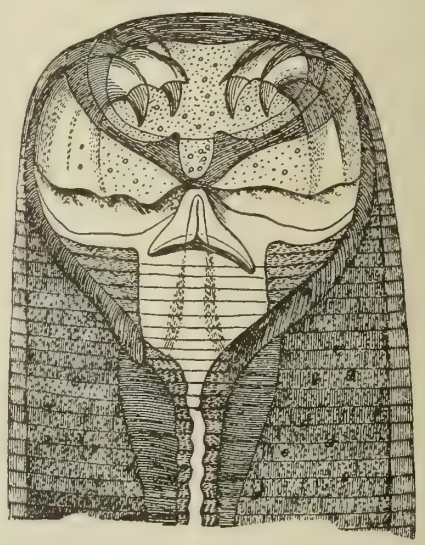
The principal English authority is Dr. J. S. Haldane, of the Home Office, who is so well known to mining circles by reason of his researches into carbon monoxide poisoning and mine gases generally. Dr. Haldane published a Blue Book in 1902 on the outbreak of ankylostomiasis at the Dolcoath tin mine in Cornwall (1), and in 1903 published a further report detailing the results of his visit to the infected districts of the continent.(2)

Several papers on the subject will also be found in recent numbers of the Transaction of the Institution of Mining Engineers, Eng.(3)

An excellent handbook is published by *The Colliery Guardian* at a nominal cost, which has had an extended circulation.

In the United States much attention has been given to the study on the "hookworm disease" or "uncinariasis" (which is for all practical purposes identical with ankylostomiasis), by Dr. Ch. Wardell Stiles, of the Hygienic Laboratory at Washington, who in 1903 issued a report on "The Prevalence and Geographic

Distribution of Hookworm Disease in the United States,"(4) attached to which will be found a very comprehensive bibliography of general literature relating to ankylostomiasis in various quarters of the globe.



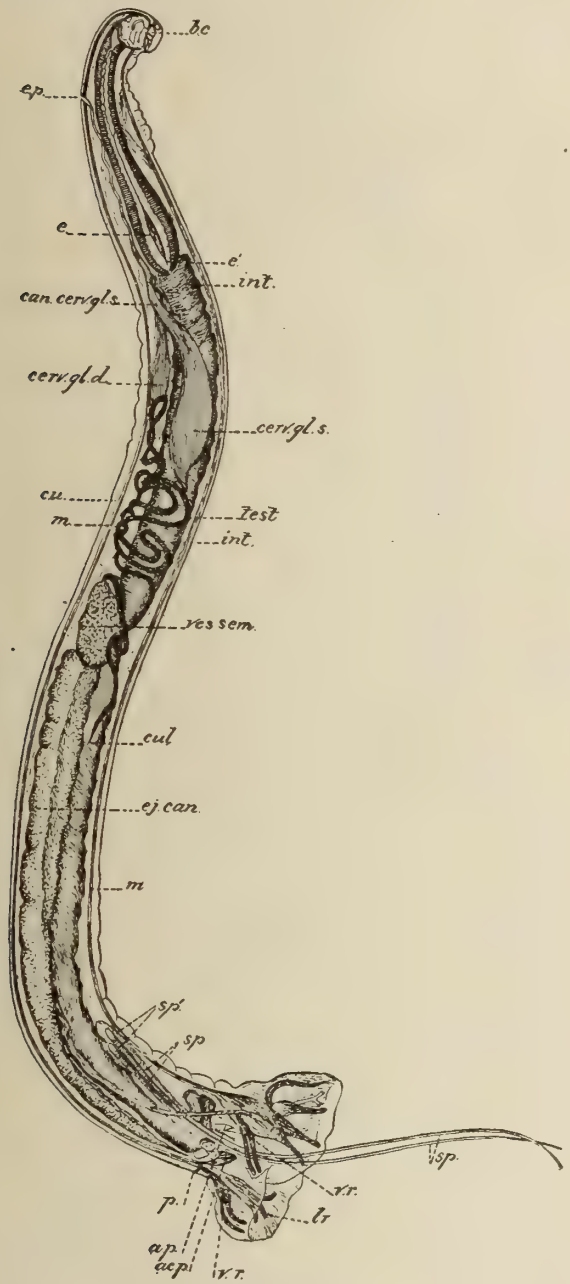
Recent continental writings are more voluminous, and apart from the monumental works of Perroncito, Leichtenstern, Looss, and other eminent European authorities, which are purely medical treatises, reference may be made to the published report of the Commission appointed by the German authorities to enquire into the Westphalian epidemic, and to various articles that have been contributed by medical correspondents to "Glückauf," the semi-official organ of the Westphalian coal operators.

But the most recent and perhaps the most important contribution from the standpoint of the mining engineer is a work published in 1906 by Drs. Calmette and M. Breton, of the Pasteur Institute at Lille(5), which covers with painstaking detail the whole subject, and the authors state in their preface was in part written especially for the benefit of the mining profession. Attached to the work is a comprehensive collection of official documents issued in various countries bearing on the disease, and a chronological index to all literature relating to ankylostomiasis from 1878 to 1904. The work has received the fullest appreciation in England and on the continent, and the authors have been honored at the hands of several learned societies in recognition of their labors. It is to be hoped that the book will some day appear in an English translation. A very free use of the text has been made in the following notes.

As will be gathered from a study of the natural conditions most favorable to the life cycle of the ankylostome, it is chiefly to be found in tropical and sub-tropical countries, and is more especially associated with low-lying and damp localities. In the temperate zones it will as a rules be found only where these conditions are artificially produced. Broadly speaking, the parasite will be found to occur normally on either side of the Equator, between the fortieth parallels (see illustration). Within these limits the disease may be endemic, and the population may be affected as a whole, as in Egypt, where it is stated no social class is immune, or in Porto Rico, where practically every inhabitant is more or less infected. Outside these limits the occurrence of the disease in anything approaching an epidemic form will as a rule be incidental to industrial operations in the course of which an artificial environment is created which is favorable to the propagation of the parasite; such conditions as, for instance, occur in the neighborhood of large brick kilns, in hot, moist, unsanitary mines, and in deep tunnelling. The persons affected, therefore, are likely to belong to distinct industrial classes, and the disease will assume the aspect of a trade malady (Berufskrankheit).

The disease is not new, and Sandwith states that the symptoms of a malady described in an ancient Egyptian papyrus, written so long as 3,450 years ago, leave no doubt that this sickness was well known to the physicians of that far-off day. The first recorded description of the ankylostome itself was given in the year 1838 by Angelo Dubini, who discovered the worms in the intestines of a young Italian peasant who had died in the hospital at Milan.

According to the various authorities cited by Dr. Calmette, ankylostomiasis is endemic over the whole of Egypt, Abyssinia, Ethiopia, along the shores of the Red Sea, and in fact over the African littoral generally. It is fairly widespread among the natives of British Central Africa, which, considered in connection with the fact that ankylostomiasis is common among the agriculturists of Southern China, suggests the advisability of preventive measures in the deep mines of the Rand. In Asia it is found over that portion of the continent extending from India through Cochin China and Siam to China and Corea. It is found in Japan, particularly round Nagasaki, in Formosa, and throughout the whole of the Malayan archipelago. In Australia it exists in the northern portion of the Island, especially in Queensland. In America it affects practically all the continent lying between the fortieth parallels. The American



Dorsal view of interior end of the Old World Hookworm greatly enlarged.

species differs in some respects from the Old World ankylostome, but these differences are only minor, precisely the same symptoms being produced by their presence in the human body. Full particulars of the extent of the hookworm disease in the United States may be gathered from Dr. Stiles' report before referred to. Dr. Stiles made a visit to the Southern States in the winter of 1902, studying the disease on the ground, more particularly in the Carolinas, Georgia and Florida, and found the disease widespread, particularly in sandy districts. In his report he writes: "Speaking in general terms, however, the facts at my disposal at present seem to indicate that, taking the Southern Atlantic States as a whole, uncinariasis must be considered as one of the most common and widspread maladies . . . Among the whites of the rural sand districts uncinariasis is apparently the most common disease found." He further states: "In all probability further study will show that in Mexico, Central America and parts of South America, hookworm disease is more important and more common than in the United States." Speaking of the economic bearing of the hookworm disease, Dr. Stiles draws a very depressing picture of the poverty and mental backwardness among the "poor whites" of the infected districts, and to quote further, he says:

(5) L'Ankylostomiase (Anémie des Mineurs), Mason et Cie, Paris, 5 fr.

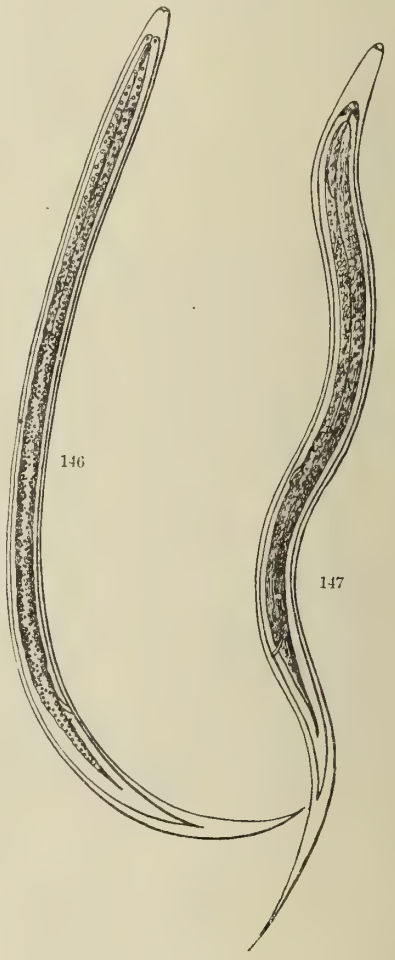
"Considering the subject in the light of all I saw on the trip, and taking what I believe to be a conservative view of the subject, I find it exceedingly difficult to escape the conclusion that in uncinariasis, caused by *Uncinaria Americana,* we have a pathologic basis as one of the most important factors in the inferior mental, physical and financial condition of the poorer classes of the white population of the rural sand and piney wood districts. This sounds like an extreme statement, but it is based on extreme facts."

Male Hookworm.

In Europe, although known to exist since the date before mentioned, the disease never assumed a serious aspect until the alarming outbreak in the St. Gothard Tunnel in 1879, whence it is extremly probable the infection was carried to other parts of Europe by the exodus of the workmen at the completion of the work. Ankylostomiasis is said to be endemic over a large portion of Italy and the low-lying plains of the Danube and the Theiss in Southern Hungary. The condition of the sulphur miners caused by the extensive infection that exists in Sardinia is truly deplorable. More detailed reference will be made to the disease as manifested in the coal mines of France, Germany and Hungary, at a later stage of these remarks.

In England an epidemic of a mysterious nature broke out at the Dolcoath tin mine in Cornwall, which was eventually traced to ankylostome infection, and this also will be dealt with more fully later.

The *ankylostome duodenale* is a parasitical worm belonging to the nematode order (thread-like). The adult female is approximately one-half an inch in length, the male being shorter and thinner, and easily distinguishable from the female by a characteristic umbrella-like caudal process surrounding the genital organs at the tip of the tail. The adult worm of both sexes is provided with a formidable suctorial apparatus, consisting of a circular mouth opening, furnished with four in-curved teeth, leading to a strongly muscular esophagus which acts like a pump, the whole forming, to quote Dr. Calmette, "a veritable cupping glass." The name of hookworm popularly applied to the ankylostome is not derived, as would at first sight appear, from the hooked teeth with which it is so liberally provided, but from the fact that the head of the worm is bent round like a hook, the mouth being on the under surface.



The natural habitat of the adult ankylostome is the small intestine of man. Here the female lays her eggs in enormous numbers, commencing to do so the day after impregnation. The eggs are very minute, about 1-400 inch by 1-700 inch, oval in form, and delicately transparent. They are provided with an inner membrane, which in conjunction with the concentrated fluid interior exerts a great osmotic pressure, and renders the eggs almost impermeable, consequently they possess extreme powers of resistance to outside agencies. They pass out of the body with the feces, usually partially developed, but development to the larval stage in the body itself is prevented by the natural heat and the lack of oxygen in the intestinal passage. After leaving the body the conditions necessary to hatch out the larvae are warmth, moisture, and the presence of oxygen. All these conditions must exist together, and if any of them are absent, development will not take place. Below a temperature of 68 degrees Fahr. or above 98 degrees Fahr. development is retarded or entirely prevented. Given favorable conditions, however, the eggs will hatch out very quickly, the time varying from several hours to two days, according as the conditions are more or less favorable. The young larva is very active, and before hatching may be observed coiling and recoiling itself with extraordinary rapidity within its shell. When it succeeds in breaking out and emerges as a free larval worm it commences to feed voraciously on the fecal matter surrounding it, and grows rapidly, changing its skin on the second or third day. At the end of from four to six days it commences to secrete a vitreous transparent fluid, gradually loses its mobility and becomes rigid, and within four to five days the larva is completely enveloped in a smooth yellowish chitinous capsule, impervious to water, enabling it to resist with ease physical and chemical influences that would have been fatal to it when newly hatched. The larva at this stage possesses remarkable vitality, and has been observed by Looss to live for a period of 300 days when immersed in water, which is said to be a medium well suited for the preservation of the encysted larvae. They have also been known to resist desiccation prolonged over five days.

This stage completes the development of the ankylostome outside the human host, and it awaits an opportunity to gain entrance to the body. It was formerly supposed that the larva of the ankylostome could develop into a sexually mature free rhabdite capable of producing eggs and disseminating infection outside of the human organism, but this theory is not now accepted. The encysted larvae may gain entrance to the body either through the mouth by swallowing or through the pores of the skin. The possibility of this latter mode of infection was for some time disputed by several medical authorities, especially in Germany, but the extensive researches of Dr. Looss, of Cairo, whose conclusions are endorsed by Dr. Calmette and Dr. Haldane, have proved, beyond doubt, that the encysted larvae can penetrate the pores of the skin, pass with the blood stream to the lungs, and from there find its way into the esophagus and finally the stomach.

A peculiar feature of the recent epidemic at Dolcoath, Cornwall, was the prevalence of pustular cutaneous eruptions known by the miners as "bunches," and many authorities record instances of cutaneous infections accompanying ankylostome infection. These eruptions occur more particularly on those portions of the body which are exposed to contamination by dirty water or mud, the chief vehicles of infection. The encysted larvae, being able to resist a comparatively long period of dryness, can also, according to Calmette, be transported by air currents, and may find entrance through the respiratory organs, but this mode of infection is probably exceptional.

When the encysted larvae reaches the stomach the protective covering of chitin is softened and loosened, permitting the worm to disengage itself from its envelope, for which it has no longer any need. Dr. Calmette remarks that the envelope is not dissolved by the gastric juices as has been supposed, but merely relaxed, he having found both the pancreatic and intestinal juices quite negative in their action on the material of which the covering is composed. After remaining in the stomach sufficiently long to divest itself of its covering—the stay there never exceeding fifteen hours—the liberated ankylostome passes into the duodenum. Here its growth is at first slow, but after a week a provisional mouth cavity makes its appearance, which is gradually modified, until finally the complete dental apparatus with its four curved teeth is perfected, and in from four to five weeks after the infection the sexually perfect adult ankylostome is evolved and another cycle commences. The worms attach themselves by their teeth to the mucous lining of the intestines, in which they bury their heads deeply, sometimes indeed they penetrate to the submucous membrane and exist in a sort of blood bath. They do not remain in the same spot all the time, but move about from place to place, so that the bites are more numerous than the actual number of the worms. If no fresh infection occurs the worms will decrease in numbers and gradually die off, but they have been known to live from five to seven years in the intestines.

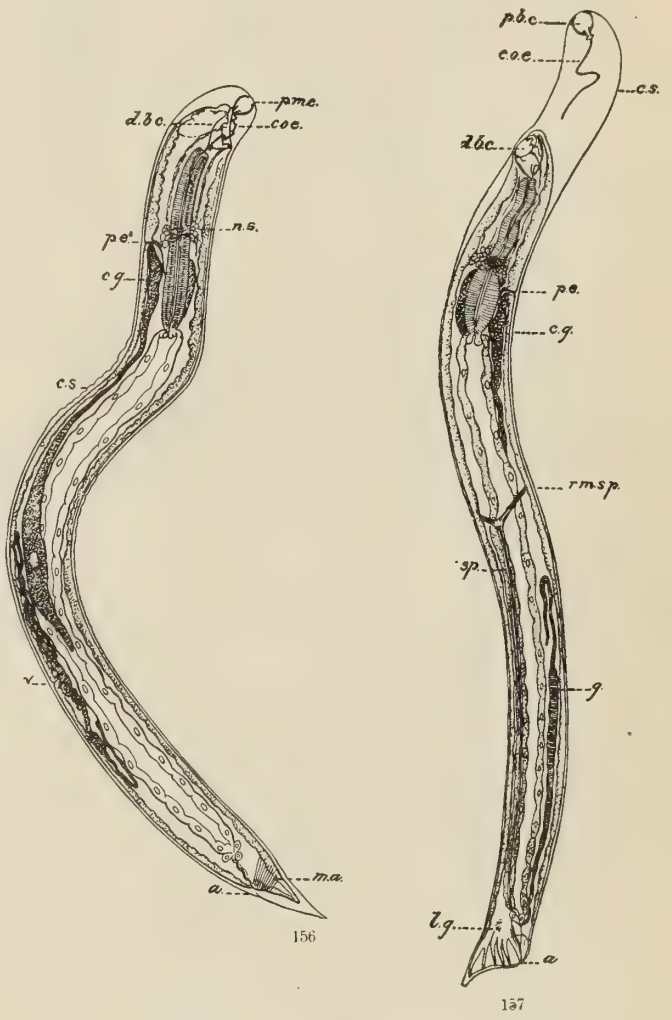
It does not appear that the ankylostome duodenale can exist in any other host than man. Various experiments have been tried to infect pit horses, mine rats, rabbits, dogs and mice with preparations of ankylostome larvae, but with entirely negative results. Dr. Bruns, of the Gelsenkirchen Institute of Bacteriology, speaking before the Berlin Conference on Ankylostomiasis in 1903, detailed some experiments on higher anthropoid apes brought direct from the Tropics. The animals were given food containing the encysted larvae of the ankylostome, and microscopical examination of their feces, after the lapse of the ordinary incubation period, revealed the presence of ankylostome eggs in no wise to be distinguished from those contained in human feces. The eggs developed to young larvae, also exactly resembling the ordinary young ankylostome, but the adult worms were quite dissimilar, being unencysted, longer, more active and incapable of reproduction. The ankylostome would appear, therefore, to possess an organism highly specialized for life in the human body, and incapable of reproducing itself except in the manner previously described. The worms cannot reproduce inside the body, and therefore for every adult worm present the host must have absorbed an encysted larva. Direct infection from person to person is not possible, actual contact with contaminated matter being necessary to contract infection.

Two Larvae in second stage.

The symptoms accompanying the presence of large numbers of ankylostomes in the human organism and constituting the diseased condition known as "ankylostomiasis" bear a marked resemblance to those accompanying pernicious anemia and the chlorosis of young women. The skin of the face becomes pale, assuming a waxy appearance as the disease advances; the mucous membrance of the lips and the inner surface of the eyelids become bloodless, and the tips of the ears have a greyish hue. Pains are experienced in the region of the stomach, sometimes accompanied by distention of the abdomen.

Diarrhoea is a feature of the disease, originating no doubt in the intestinal irritation set up by the worms, and this alternates with an obstinate constipation. The

feces present often a brownish or reddish cast owing to the bleeding of the intestines from the bites of the worms. As in all diseases of this nature, the appetite is capricious and irregular, sometimes abnormal and at other times poor. The taste becomes perverted, the sufferer evincing a desire for such things as pickles, salt and dirt. Dr. Stiles makes extensive remarks on this feature, which occurs very frequently among the "poor whites" of the Southern States, where he found cases of "sand-lapping," "resin chewing" and "dirt eating," and he remarks that this perversion of taste may be "classed with the chewing of slate pencils, resin, coffee, sucking of lemons and salt, etc., as an abnormal appetite due to the anemia and abnormal condition of the intestinal tract."



The affected person suffers from dizziness and palpitation, and from shortness of breath on the least exertion; he has frontal headaches, becomes extremely sensitive to cold and loses all desire for work. In the final stages of the disease dropsy may supervene, and the sufferer is reduced to a condition of general debility that renders him an easy prey to other diseases. In some cases affections of the skin may be present, as before mentioned, and a bronchial catarrh has been noticed by Belgian doctors as sometimes accompanying the other symptoms. These latter symptoms are probably due to the irritating effect of the larvae when effecting their entrance through the skin, but the main symptoms are without doubt the result of the anemia consequent on the altered condition of the blood, which is the most prominent result of the presence of the worms. The proportion of the red corpuscles in the blood is largely reduced, and a distinctive feature is the marked increase in the proportion of eosinophile leucocytes (colorless corpuscles of the blood, so-called from the fact that they are readily stained by eosin), which under the miscroscope afford a means of diagnosis that has been found of value.

The symptoms of course are progressive, and are not the same in all cases, the resistance of the individual playing an important part. The severity of the anemia is dependent on the number of the parasites present in the intestines and the length of time they have been there, modified by the powers of resistance possessed by the person attacked. Some persons may carry numbers of the worms quite unconscious of the fact, and to all appearance possessing good health. This fact led the German doctors to separate their ankylostomiasis patients into two classes—"worm-carriers" and "worm-sick." The first named class included those persons whose dejecta contained the ova of the ankylostome, but who were not apparently unhealthy. The second class was composed of those in whom the ravages of the worms had so far advanced as to present all the characteristics of a disease, the patient being visibly anemic, and exhibiting plainly the peculiar symptoms of ankylostomiasis.

The blood-sucking propensities of this creature, while sufficiently serious, do not altogether explain the marked alteration which takes place in the character of the blood, and several authorities incline to the opinion that the parasite secretes a toxin which causes this altered percentage of the blood constituents. Sandwith, referring to fatal cases of ankylostomiasis that had come under his observation, states:—

"The actual cause of death was exhaustion from utter absence of rallying power. It is difficult to believe that the pathological effects are induced only by hemorrhage from the daily suction of scores or even hundreds of worms. In addition to this loss of blood we have general thickening and degeneration of the duodenum and jejunum, and consequent interference with normal digestion; then non-assimilation, and eventually a process of slow starvation. It is also worthy of note that there may be in prolonged cases some self-poisoning from the great number of bites in the intestines containing ill-digested and perhaps decomposing food."

In prolonged and severe cases of ankylostome infection the outward symptoms of paleness, etc., are sufficiently obvious, but, as before mentioned, not all "worm-carriers" exhibit outward symptoms, and the recognized and perhaps the only absolute test for the presence of the worms is microscopical inspection of the feces for the ova of the worms. Dr. Stiles gives a quick and ready method for preliminary diagnoses of suspected cases. About an ounce of flesh feces is placed on a

Male and Female Hookworm before the fifth casting of skin. 14 to 15 days old.

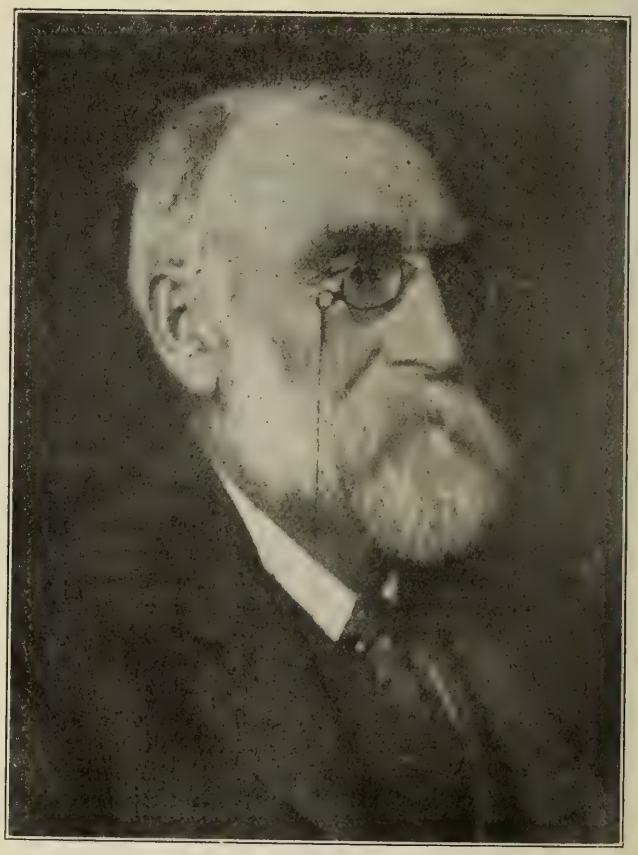
sheet of white blotting paper and allowed to stand for from twenty minutes to an hour. In medium or severe cases of ankylostomiasis a reddish brown stain will be left on the blotting paper. The blood examination for ankylostome infection is based on the proportion of eosinophiles. The finger of the person under examination is pricked with a needle, and the resulting drop of blood is smeared on a slide, which before examination under the miscroscope is treated with eosin dye. This method is quicker and less repugnant than fecal diagnosis, and while not absolute, as there are other intestinal parasites which have a similar effect on the blood corpuscles, it is still very accurate, and affords a rapid

and cleanly method especially applicable to the preliminary selective examination of large numbers of men. It has been largely used in England by Dr. Haldane in connection with his enquiries in the mining centres of that country.

Thymol and male fern are the two drugs usually administered to expel the worms. Thymol is preferred by the American and English profession, while in Germany extract of male fern has been very generally used in connection with the Westphalian epidemic. The use of these drugs is not unattended with danger where the patient is weak, but as a rule two and rarely three doses are sufficient to expel the worms. In some cases, however, repeated doses will not do this, more especially where the infection is of long standing. After the parasites have been removed the delibitated constitution of the patient requires to be built up by means of a nourishing diet and the administration of iron in some form. Where the disease has not progressed too far the patient will usually make a rapid recovery, but after a certain stage the health remains permanently impaired, even when the worms have been all expelled.

(To be continued.)

SOME REFLECTIONS IN SECRECY ON THE ARTS.



Dr. James Douglas

(Paper read Toronto meeting A. I. M. E.)

Though liberality is not supposed to be a prominent trait of the Scottish character, Canada owes to a Scotchman, Sir Wm. Macdonald, more than to any other of its people, not only wise ideas, but pecuniary help towards extending education. And another Scotchman in New York has sumptuously housed under one roof three branches of the engineering fraternity. Being thus created the members of the same family—for the metaphorical meaning of house and kinship is identical—Mr. Carnegie expresses more emphatically than even he could in words, that by affording facilities for closest intercourse, he invites the mechanical, electrical and mining engineers to participate in the freest interchange of ideas and experiences, and to correlate and combine the results of their studies and activities, and, being members of the same household, to banish reserve and secrecy.

And now we, the members of the American Institute of Mining Engineers, meet as though we were at home in a neighboring country. For whether we meet in Canada, in England, or elsewhere, the association is always received as though no political or geographical divisions separated its members from those of congenial incorporations in the land of its host. In fact the title which we have assumed claims for the sphere of our activities the whole American continent, regardless of such trifling details as boundary lines.

The fact that we meet to communicate each other's experience, to discuss our difficulties, and to seek each other's aid in solving the intricate problems that so often present themselves in the course of our professional life, is an acknowledgment of our individual helplessness; and therefore an argument for united effort. But no effort can be of any value if there is an underlying suspicion of reserve and lack of candor in our treatment of the technical questions which it is our province at these meetings to discuss. And yet there are limits to the extent to which we may go as officials of public companies. We know that even as professional men it is not always easy to reconcile principles with practice, and on this subject of sincerity and transparent diffusion of our experience there is both difference of opinion and difficulty of application. Few of us are as favorably situated as the college professors, whose first duty is to unbosom themselves to their students of all they know, and perhaps of a little they only suppose they know. We are most of us paid officials of corporations whose *raison d'etre* is to make money, and whose executive officers sometimes, not without some reason, consider their trade secrets as part of their capital. Some companies confide these secrets to the honor of their technical workers under as strict rules as those imposed on their cashier in the distribution of their money. Unless, therefore, our employers permit, we as employes are under pledge of secrecy. Many large

DR. JAMES DOUGLAS

manufacturers and mining and metallurgical concerns put no restriction upon the freedom of their technical staff, but some of our largest certainly impose on their employes absolute silence as to all that transpires within their laboratories or workshops.

If the question were left to ourselves, it would be easy of solution. Our reliance on one another as workmen in such distinct branches of engineering as civil, mechani-

cal, electrical and mining, is so close that we must co-operate in every large enterprise we undertake. We cannot succeed singly, for few of us claim to be so encyclopaedic in our knowledge or universal in our experience as to make it safe to rely on our own acquaintance with the practical details of every one of these important departments. We therefore seek each other's assistance, and consequently share in each other's secrets, for every man's special knowledge is to the other man, who is more ignorant or inexperienced a secret, or "a mystery," as old tradesmen and professional men used to call it.

Every industrial advance brings us closer together and makes it more impossible to act independently. Till very recently the civil engineer surveyed and located the line of railroad; the metallurgist made the rails and the iron and steel for the locomotives; the mechanical engineer designed the equipment, and what was left for the electrician to do was to string the telegraph wires. Now all this is changed. The electrical engineer is, in importance, springing into the first rank, and he requires such special acquaintance with the mysterious forces whose distribution and useful energy he handles with so much audacity, and yet safety, that few of us are particularly anxious to meddle with it.

Or take a mining instance—when called on to decide as to the adoption, in underground or overground haulage, of electricity or compressed air, even in metalliferous mines, the verdict must depend on so many delicate and purely technical considerations that few superintendents or general managers would consider themselves sufficiently informed to commit themselves, until their mechanical and electrical advisers had marshalled all the facts and arguments for and against each system. I need not cite other instances in which co-operation is demanded in the carrying out of almost every modern enterprise, or in the equipment of the complicated mechanisms which have replaced the simpler contrivances of our forefathers. The modern steamship exceeds Columbus' caravels in size and in complexity of construction as much as does a limited train an old stage coach. And in proportion to the multitude of their parts and the tremendous energy of the forces which must be called into play to move them, is the diversity of knowledge, talent and skill required to design, construct and operate them. As I have said, therefore, if it depended upon ourselves, there would be no difference of opinion as to the necessity of perfect open-mindedness, and as little backwardness in applying the principles to practice.

I think, moreover, that many of us are also convinced that open-mindedness to the suggestions of others is a useful quality to carry into our work, even after we and our scientific staff, in our wisdom, have co-operated in formulating and laying out our plans. Every draftsman in our office, every master mechanic in our shops, every foreman in our mines, is an expert in his particular line, and may be supposed to be familiar with minutae which have escaped our observation, or, to put it frankly, may know more than we do ourselves on some of the innumerable details which make up the sum total of the questions on which we have ultimately to pass. The suggestions coming from such subordinate sources may not always be worthy of acceptance, but on the other hand it is never wise on our part to turn a deaf ear or a disdainful shoulder to them. In our own small way we feel sometimes almost ashamed at the credit accorded to ourselves, for ingenuity and foresight in devising either mechanical or industrial novelties, or in organizing large schemes when we recall the hints from others which have suggested thoughts to ourselves. For though undoubtedly even in the most imposing cases the one inspiring mind may have conceived the idea, either of the invention or of the enterprise, only by the co-operation of a number of subordinate agents, who often belong to the multitude of the unknown and forgotten, could the idea have been worked out to the glory and the profit of the inventor or promoter. It is always difficult to decide how much of the result should be passed to the credit of the conspicuous man and how much to that of the hard-working, plodding, unimaginative grubber among details, or to the brilliant, erratic and because erratic, unsuccessful fellows who do so much of the world's work, and yet get so little of the credit or the gold. But this is certain that in our own work, whether it be conspicuous or not, we will always benefit by inviting suggestion from the humblest of our co-operators, and encouraging them to think independently and not to be afraid of expressing their thoughts. That this is already one of the prominent qualities of American industry is manifest from the large number of patents which are taken out by inconspicuous laborers in the field of engineering—especially in that of mechanics.

I recently went one Friday morning into our purchasing department, and found every desk empty, and all the clerks assembled in the manager's room. He had found it conducive to the most efficient conduct of his office to assemble all his staff once a week for free discussion as to the most economical distribution of work. The consequence was that instead of late hours and overtime, the result was obtained very easily within office hours, for suggestions from the men actually engaged were found to be worth more than from those merely superintending. The youngest were not snubbed, if they ventured to make a remark, and thus the spirit of pride and co-operation pervaded the whole group. We have all heard how Mr. Carnegie is said to have stimulated the rivalry of his superintendents and heads of departments by getting them to meet at intervals over an excellent lunch, where around the table all jealousy vanished, and all little technical secrets which are liable to exist even among friends were revealed. But good cheer is not, or should not be, necessary to make the great brotherhood of technical workers unfold their sympathy and unbosom their secrets to one another.

But to return to our main subject. How far and how completely should even corporations and industrial concerns permit and encourage the interchange of information? I am inclined to think that few limits should be set, for every limitation means the concealment of some fact or some principle which only if revealed can be developed to its full significance and utility. As a rule this can be done only by the action of many minds and many hands. Till developed it does not yield its full advantage to even the original discoverer, for he alone, unaided, in the solitude of his laboratory or behind the bars of his factory, without the practical assistance of his fellow-workers, rarely brings his original germinal idea into efficient, practical utility.

Were we free to appeal to purely altruistic motives, it would therefore be superfluous to argue in favor of complete knowledge and experience-sharing, but profit-sharing is after all the impelling motive of industrial advance to-day, as it has been in all ages, and to reconcile the admitted evils of secrecy with the admitted advantages of publicity, the patent laws have been framed. They have always given the patentee the right to use in either his person or through his agent his inventions or discoveries for a limited number of years, provided he

describes it so fully that it can be practiced by one skilled in the art. The publicity and knowledge conveyed by the specification stimulates the inventive faculties of others, and patented and unpatented improvements along the line of the original invention demonstrate both the value of publicity and the cupidity of men even of the technico-scientific class. Among the great inventors of our day was Sir Henry Bessemer. Before the Royal Commission appointed to suggest revision of the British patent laws, he gave evidence, some of which he has embodied, with very suggestive comments, in his autobiography. Before he became famous he devised machinery for making bronze powder, and manufactured in secret. Of this he says:—

"While referring to patents for inventions, I cannot refrain from pointing to this particular invention of bronze powder as an example that may advantageously be borne in mind by those short-sighted persons who object to grants of letters patent. There can be no doubt of the fact that the security offered by the patent law to persons who expend large sums of money and valuable time in pursuing novel inventions, results in many new and important improvements in our manufactures, which otherwise it would be sheer madness for men to waste their energy and their money in attempting. But in this particular case the conditions were most unfavorable for patenting, owing to the fact that the article was only a powder and could not be identified as having been made by any particular form of mechanism. Therefore it could not be adequately protected by patent. Moreover, by my machinery, the cost of production, if only paid for at the ordinary rates of wages, did not exceed one-thirtieth of the selling price of the article. This fact alone offered an irresistible temptation to others to evade the inventor's claims, and so rendered the patent law a most inadequate protection. On the other hand, the great value of a small bulk of the material made it possible to carry on the manufacture in secret, and this method of manufacture was rendered the more feasible by making such different class of machine self-acting, and thereby dispensing entirely with a host of skilled manipulators. It may, therefore, be fairly considered, so far as this particular article was concerned, that there were, in effect, no patent laws in existence.

"Now let us see what the public has had to pay for not being able to give this security to the inventor. To illustrate this point, I may repeat the simple fact that the first order of bronze powder obtained by my traveller was for two pounds of pale gold, at eighty shillings per pound net, for the Coalbrookdale Iron Company. I may further state that, in consequence of the necessity for strict secrecy, I had made arrangements with three young men (my wife's brothers), to whom were paid salaries far beyond the cost of more manual labor (of which, indeed, but little was required). My friend, Mr. Young, desired to occupy the position of sleeping partner only; so I had entered into a contract with him to pay all salaries, find all raw materials, pay rent, engine power, and bring the whole produce of the manufactory into stock, in one ounce packages, ready for delivery, at a cost, for all qualities, of five shillings and sixpence per pound; after which he and I shared equally all profits of the sale. It is rather a curious coincidence that the one ounce bottles of gold paint were labelled five shillings and six pence, of which the retailer was allowed a liberal discount.

"Had the invention been patented, it would have become public property in fourteen years from the date of the patent, after which period the public would have been able to buy bronze powder at its present market price, viz., from two shillings and three pence to two shillings and nine pence per pound. But this important secret was kept for about thirty-five years, and the public had to pay excessively high prices for twenty-one years longer than they would have done had the invention become public property in fourteen years, as it would have been if patented. Even this does not represent all the disadvantages resuling from secret manufactures. While every detail of production was a profound secret, there were no improvements by the outside public in any one of the machines employed during the whole thirty-five years, whereas during the fourteen years, if the invention had been patented and published, there would, in all probability, have been many improved machines invented, and many novel features applied to totally different manufactures.

"I have lingered long over this subject of bronze powder, because it is one which has had great influence on my career; it was taken up at a period when my energy and endurance, and my faith in my own powers, were at their highest; and as I look on all the incidents surrounding it, through the lapse of time and the many changes of the fifty years since it was undertaken, I wonder how I had the courage to attack a subject so complicated and so difficult, and one on which there were no data to assist me. There were not even the details of former failures to hold up the finger of warning, or point out a possible path to pursue, for no one had yet ventured to try and replace the delicate manipulation which experts had made their own, both in Japan and China, where texts and prayers printed in bronze were offered up at the shrine of Confucius two thousand years before I had ever seen a particle of bronze powder."

He concludes this first reference to his powder in the following paragraph:—

"In closing these details of the bronze powder manufacture I may say that later on the handsome royalties paid by my steel licenses rendered the bronze powder business no longer necessary to me as a source of income; and I had then the extreme satisfaction of presenting the works to my brother-in-law, Richard Allen, who had, with so much caution, successfully kept, for more than thirty years, a secret for which, he perfectly well knew, some thousands of pounds would have been given him at any moment."

But he returns to the subject of patents when discussing another invention of his life, that for making optical and plate glass, the value of which for some reason or other the trade has never appreciated. He says: "There is one point in connection with patented inventions upon which I have always felt strongly. I have maintained that the public derive a great advantage by useful inventions being patented because the invention so secured is valuable property, and the owner is necessarily desirous of turning that property to the greatest advantage; he either himself manufactures the patented article, or he grants licenses to others to do so. In either case the public reaps the advantage of being able to purchase a better or cheaper article than was before known to them, due to the inventor's perseverance in forcing his property upon the market. But if a novel article or manufacture is simply proposed by a writer and published in the technical press or in newspapers, as a rule (almost without a single exception) no manufacturer will go to the trouble and expense of trying to work out the proposed invention. He says to himself:

'I shall not risk the expense necessary to develop this new idea, for it may entirely fail; or even if I succeed, its development will cost me much more than it will cost other manufacturers, who will immediately avail themselves of it if I succeed; no, let some one else try it'; and so the invention is lost to the world in consequence of having been given away. This loss to the public is equally the case with patents that are not taken up; and one of the simplest and most effective inventions which I have ever made may be here cited as an example, as it formed part of the novel system of plate glass manufacture just referred to."

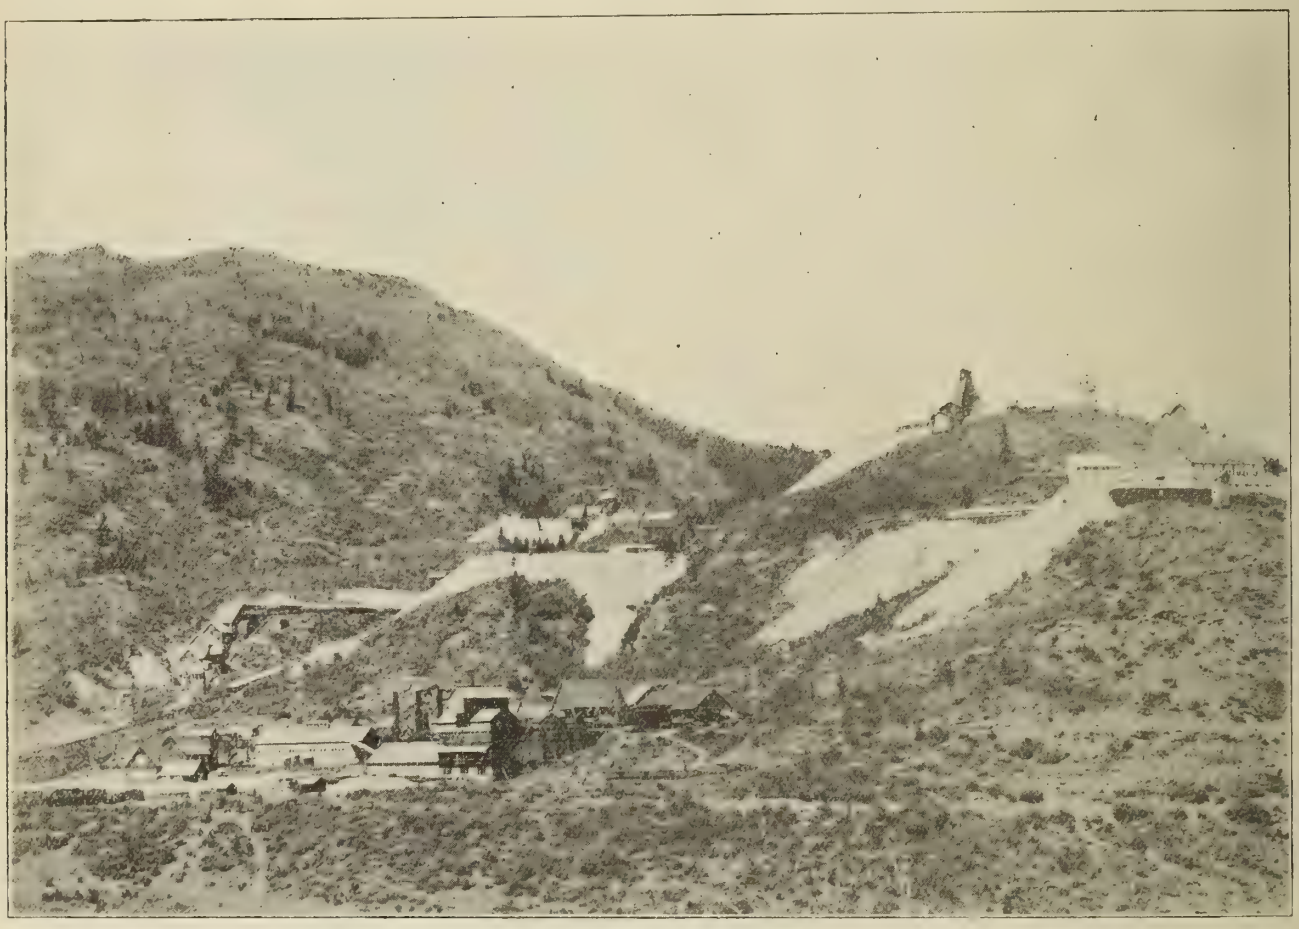
After describing his plate glass invention and its public neglect, he says: "From what I have said I think I have shown that, however self-evident an invention may be or however advantageous it might be to a manufacturer, if it is public property he will not touch it."

Sir Henry was doubtless correct in asserting that under the impulse of self-interest inventions are pushed by the inventor more vigorously than if he had merely the scientific credit due and given to investigators to spur him on. But he really gives us an argument against patents when he describes the apathy of the public to his glass patents. His steel patents he worked out himself and brought to perfection after years of heavy expense and labor, and by adopting certain modifications to fit special cases. His plate glass patents he owns himself, but they would probably have been loaded down with royalties which the trade did not care to pay while taking the risk of applying them to practice. As to his bronze powder, he would probably have made far more out of it had he reduced the exorbitant prices and increased the demand, even while manufacturing it behind closed doors. But it is foreign to my purpose to discuss the patent laws, except casually as they bear upon the subject of secrecy in the arts. Sir Henry's generalizations are substantially correct, but they are too sweeping, for there have been great inventions which the public has not been backward in using, though they were gratuitously offered to the world. One's thoughts pass with pleasure from the contemplation of the money-making inventors and investigators to such prophets and apostles of science as Sir Michael Faraday. Sir Michael's profound and original investigations into electricity and magnetism gave the world the dynamo. Though he did not work out the mechanical details of a practical generator, he undoubtedly invented appliances which might have been used for making a a strong basis claim for a patent. But nothing could have been more repulsive to his spirit or foreign to his high aim in life than gauging his time and talents by a mere money standard. He lived contentedly on the small salary he received from the British Institution, preparing his lectures to children with as much care as he bestowed on those delivered before the Royal Institution which made him famous; turning his great learning and power of investigation to the nation's good in return for very scanty remuneration, for he had deliberately decided to devote his life to scientific research for truth's sake, rather than to use his vast attainments in the service of mammon. At the commencement of his career, Faraday added to his salary from the Royal Institution by what he called "commercial work." At first his average earnings from this source were £240 per year. They reached by 1831, £1,831. By 1838 this had shrunk to nothing, for in the meantime his great discovery of magneto-electricity was made, and his whole soul was so absorbed in his experimental work that neither time nor energy could be spared for money-making.

(To be continued.)

LE ROI MINING COMPANY, LIMITED, ROSSLAND, B.C.

By Geo. A. Ohren.



Le Roi group, located on one of the richest portions of Red Mountain, and within the corporate limits of the City of Rossland, B.C., has had a rather varied career and history, since it was first staked, in July, 1890, but it is obvious at the present moment, even to the most casual observer, that the affairs of this concern are on the ascending side of the prodigious wave of prosperity that is now sweeping the country, and with good management, such as it would appear is in effect at present, is bound to attain the goal of successful mining.

Under the effective supervision of Mr. A. G. Larson, superintendent, a very extensive campaign of development work has been carried on during the past several months; the main five-compartment shaft has been deepened from the 1,050 foot station to the 1,650 foot level, and the work of opening up large known ore bodies from the 1,650 level will soon be in full progress. Owing to the sinking and retimbering of the main shaft, and to much diamond drill work and drifting being done, the mine management has had to work assiduously to make both ends meet. But working on this basis, that is, shipping an average quantity of ore and doing an extended amount of development work, is surely good mining practice, under the conditions that existed when this work was inaugurated. The mine is in a position at the present time to hoist and ship a large tonnage of ore of good quality for some time to come, with average development work, which will no doubt result, in the impending months, in excellent profits, unless of course some now unforeseen factor creeps in. But this is hardly probably, as Le Roi is a gold mine, and a financial crisis or fall in the price of copper would hardly affect its operation, while as far as labor is concerned, it is on the most amicable terms here with the employer and wages have recently been advanced about 20 per cent., drill runners now getting $4 per day of eight hours, and other labor in proportion.

The mine is at present producing about 2,500 tons of first-class ore per week, but they are gradually getting additional furnaces into operation at the Northport smelter, lack of fuel and labor having held them back somewhat, up to the present, and the day is not far away when the above shipments will be greatly augmented. The principal development work now under way is the connecting of a winze, from the 1,050 to the 1,650 levels, with the main shaft by a drift on the 1,650 foot level. This work has been held back somewhat by the retimbering of the shaft, which was more of a task than a few words imply.

A short while ago the Le Roi Mining Company bonded the Spitzee group of claims, which adjoin Le Roi properties on the south, and they are now doing considerable work on this property. The rich Spitzee lead was discovered when the Canadian Pacific Railway Company cut through a knoll on that property. Some of the best ore in the camp has been found in the Spitzee workings, but not in very large bodies so far, which consist of a shaft, about 200 feet deep, with some drifting and upraising.

Impecuniosity has been the chief ailment of the Spitzee Company, and it is thought that the Le Roi Company can make a valuable property of this nascent mine with a small financial outlay to begin with. The Spitzee group includes the Spitzee Fr., Fool Hen, Darby, and

Le Roi Headworks and Hoisting Plant on hill in foreground. Power and Air Compressing Plant in foreground. Note Le Roi, No. 2, Properties and War Eagle Headworks in background.

Nelson No. 2, comprising about 110 acres. The properties controlled by Le Roi Company proper embrace Le Roi Claim, Le Roi Fraction, Black Bear, etc., containing approximately 100 acres, or 210 acres in all, if they take up the Spitzee bond. The Spitzee holdings include the surface rights of some of the claims, much of which is valuable city property.

In the company's report for the year ended June 30th, 1906, dated November 27th, 1906, it is shown that the balance in favor of profit and loss account at the end of the fiscal year was £37,138 7s. 10d. on the operations of the company for the year, which added to £150,539 1s. 10d. from last year totals £187,677 9s. 8d. Out of this an interim dividend of one shilling and sixpence was paid on the 28th February, 1906, absorbing the sum of £15,750. The directors recommended a final distribution of 2s. per share, less income tax, making 3 1-2 per cent. for the year and leaving the sum of £150,927 9s. 8d. carried forward. This was the first Le Roi dividend since 1899.

The above profit of £37,138 7s. 10d. was arrived at after writing off £28,628 10s. 5d. in respect of exploration and development; £18,163 19s. depreciation on machinery, plant, surface improvements, etc., at the mine and smelter; £3,727 10d. for special expense in connection with amalgamation scheme; paying £3,464 4s. 2d. to the British Columbia Government in full settlement of their claim in connection with revision of taxes, covering period July 1st, 1900, to October 17th, 1905; and deducting other sundry items of expense amounting to £6,315 1s. 10d.

The liabilities, June 30th, 1906, were £15,282 7s.; liquid assets, £126,966 10s. 7d., showing a surplus of liquid assets over liabilities of £111,684 3s. 7d. Cash on hand at London and Rossland at that date was £90,-097 1s. 7d.

On August 30th, 1905, the directors removed Mr. McMillan, managing director, at present writing, from the board, and entered into a contract with the Trail smelter to treat the output of the mine, asserting that a saving would be affected. But it would seem that this was not the case, and at the time of writing the Northport smelter is treating the entire output of the mine, the contract with the Trail smelter having been settled and cancelled.

The cost of ore production, 1906, was $2.84; exploration and development written off, $1.26; depreciation on

mine account, 36 cents; smelter and realization charges (direct and indirect, including first depreciation, interest, etc.), $6.04; total, $10.50.

During the year 110,042 dry tons of ore was shipped, valued at $12.37 per ton, to Northport and Trail; 26,850 tons were smelted at Northport, and 83,192 at Trail. It cost the company $312,615.29 to load this on the cars, equal to $2.84, and $1.25, as per above table. It will be noted that good management and strict economy are required to make the Le Roi mine pay, as the margin is so narrow between cost and realizing figures.

Ore smelted at Northport was 36,851 dry tons; matte and "clean-up" shipped was 1,489 tons, of a net value of $505,002.13, equal to $337.10 per ton.

Le Roi averaged:—Gold, per ton, .39 ounces; silver, .54; copper, 1.16 per cent.; average value, $12.37. There were 7,180 feet of development work done during the year, the cost of which was $127,616.38.

The cost per foot of upraising was $33.75; winzing, $45.85; crosscutting, $16.18; drifting, $15.76; diamond drilling, $2.88.

The rock in Rossland camp is of a very hard and tough quality, and development work is costly. The above figures will give a very fair estimate of what the mines of this camp have to contend with. It would be almost impossible to mine here if the ore was not generally found in very large bodies.

As is generally known, Le Roi lead was discovered in July, 1890, by the two prospectors who located the Centre Star, War Eagle, Virginia and Idaho claims. They gave Le Roi claim to E. S. Topping, then of Trail, B.C., six miles from here on the Columbia River, and at that time the gateway to this camp, for having the five claims recorded, which cost him $12.50. The first samples taken ran $38 to $40 per ton in gold alone. In November of the same year Topping bonded the claims to a syndicate of Spokane people, receiving $16,000 in cash as a first payment. The Spokane men, subsequently acquiring the property from Topping, worked the mine until 1895, when it again changed hands. It paid for its own equipment and development from the grass roots. In 1896 the first dividend from the products of the mine was paid, amounting to $25,000, and further dividends, which aggregated $825,000, were paid up to the time the British American Corporation, of which Whittaker Wright was one of the promoters, took the property over. This corporation in 1898 paid about $6 per share for the majority of the stock, or equivalent to $3,000,000 approximately for the property; the minority interest was afterwards purchased for about $8 per share, hence they paid in all about $3,750,000 for the mine. Some of those who sold their stock at $6 and $8 had bought it as low as 10 cents per share, the rapid advance having been made by the discovery of prodigious bodies of ore in what is known as the Black Bear Tunnel, where the ore, which was only an ordinary showing on the surface, had widened out like an inverted funnel.

After the acquisition by exotic interests the mine produced another $250,000 in dividends. This, with the dividends declared in 1906, would make a grand total of approximately $1,245,000. This over and above a large expenditure for the very complete and up-to-date mining, hoisting, power and smelting equipment at Rossland and Northport.

The different members of the present management, and more especially the managing director, superintendent and business manager, are all votaries at the shrine of higher mining practice, and will no doubt in due time steer the good craft Le Roi into the harbor of affluence, which is a consummation earnestly looked forward to by all those interested in the company, directly and indirectly, both in this district and abroad.

HOW LONDON VIEWS COBALT

Two years ago London casually considered Cobalt. That is, London superiorily accepted the haphazard statement, varied here and there by authentic data, that phenomenal argentiferous rocks had been definitely located in Northern Ontario—about which the average man in the city knows as much as he does about geological horizons. Reputable commissioners came here with something to sell, or something requiring research work in the laboratory; newspapers gave a little space to statements of values based on actual shipments; speculators were incredulous; technical men were curious if cautious; but London remained aloof because it prefers the yellow to the white metal. There is a glamour about gold that appeals to Throgmorton , Threadneedle and Lombard Streets, consequently Siberia, Korea, Rhodesia and the contact rocks in the vicinity of the mountains of the moon were given precedence to Cobalt's complex silver ores. It required considerable persuasion to establish the excellencies of the Cobalt country, silver contents exceeding Virginia City and Leadville records from surface development being sagely regarded as enrichments at outcrop likely to prove impoverishments at depth. Probably London technical experts are no exceptions in fortifying themselves behind "insufficient work." They reserved what judgment they had, at any rate, and their precaution was the more hastily exercised owing as much to metallurgical intricacies as to the indisposition of mining financiers to enter an untried field.

London is so constituted it will not confess error. Nevertheless, its inability to be sensible about mining in general is proverbial. If assured that Cobalt is less ephemeral than hopes as to Rhodesian banket, Witwatersrand revivals, Siberian lodes and Korean occurrences are known to have been, the section served by the Temiskaming & Northern Ontario Railway would be less askant to its glances. Leading Siberian promoters are luxuriating at fashionable hostels or are nursing their impaired balances, while the participating portion of the public would forget the experience if possible. Rhodesia's fiasco is now measured by a maximum of loss and minimum chance of recovery. Korea has its own troubles. The underwriting of public issues is something about which monied men are chary. London has the worst attack of "funks" the habitues of the "Devil's Kitchen"—in Bartholomew Lane, opposite the Bank of England—recall. The guaranteed South Manchurian loan, underwritten in sixty minutes, is thirty-five shillings below the issuing price the day following the closing of the lists. Witwatersrand—"Kaffirs"—shares are in the dumps. You would naturally suppose Cobalt would be taken seriously, though carefully; yet such is not the fact. Somehow there is a suspicion that the permanency of Ontario's infant prodigy—its longevity, rather—is too problematical to permit of the purchase of dollar shares at 25 or 50 cents, or of areas vouched for somewhat in this fashion:

> "The favourable geological formation, large area and situation, make this property undoubtedly of great prospective value, and I am of opinion that *when it is prospected and developed important discoveries* will be made."

It is all very well, and it may be comforting, to learn that $1,000,000 will demonstrate the truth or falsity of the "opinion" herein expressed. There was a time in the "Woolly" West when it was painfully in evidence that "foxes have holes" in the ground, and that the venturesome "tenderfoot" had holes put in his purse when he went afield. Hundreds of millions have been stakes at the Witwatersrand upon bore-hole results, but all that is at an end, and Toronto's fields will not be supported upon such conjectures, or the "logic" of an F. G. S. and M. I. M. M. of London, who in this same connection writes:

> "The *geological trend* of the lake (sic) is in a north-east and south-west direction, and is such that it cross-cuts the run on the east and west veins of the district for a distance of one mile, *and any* continuation of these veins from the adjoining properties will run into this company's property. For instance, the ..... vein of the ..... Company has a magnetic bearing that *must bring any* continuation of that vein into this property."

Another expert puts it that these "veins on adjoining territory, especially the ....., have a course which would indicate, *if they continued*, they would enter ..... Lake, but as the entire ground is under water, this cannot be ascertained until the lakes are drained."

A Lieut.-Colonel, Bank Manager, Provincial Minister, Lieut.-General and a Baronet have subscribed to the prospectus of this company in embryo. They solemnly incorporate in their request for a million dollars on this description of a body of water, "geologically" almost at right angles with the "strike" of veins as disclosed in an adjoining property, which veins may be "discovered" under the lake when the "prospective value" has been established by prospecting and development!

Amrican speculators profited by disposing of cheap acres afterwards ascertained to be under water, or swamp land. The gullible and overcredulous are domiciled universally. London, however, having a spasm of worldly wisdom, will not go diving and have promoters pump such air to its capitalists. Besides, there is greater need for facts as to silver contents at depths, away from lakes, before submarine mining is attempted. That this is pressingly so, I submit the following extract from the *Daily Mail*, appearing in to-day's issue:

[The danger is that Cobalt may "pinch out," as other silver fields like it have done in the past. There is so much precious ore right on the surface that there are places where you can rub your boot on the rock and see it shine like a bright new silver sixpence. But most geologists believe that the rich values lie only near the surface and will soon be exhausted. However, geologists, like other people, are as often wrong as right, and at present the man who should express a doubt on the spot as to Cobalt being a deep-level proposition would be well advised to leave camp by the next train. The camp speaks with lowered voice of truck loads which fetched their owners ten thousand, fifteen thousand, twenty thousand pounds. That three mines alone have made already £4,000,000 between them is an authentic fact. It is nothing out of the way for the ore to yield 75 per cent. of silver, and there are by-products too.

The pitiful part of it is that the small investor should be so fleeced. It may be the richest silver mine field in the world, but if it were capable of yielding a quarter of what the wild-cat prospectuses have promised, it would have to be four times richer than even the optimists believe it to be. Already more money has been lost over worthless properties than has been made out of paying mines. A mania seized the Canadian public. The newspapers were filled with alluring baits for the get-rich-quicks, who swallowed them with fatuous avidity. Now they are beginning to see what fools they were. Even if the production for 1907 totals up to £2,000,000, the figure predicted by the most hopeful, I have the authority of Mr. Nicholas, of the Canadian Geological Survey, for saying that this will not serve to pay a reasonable dividend on more than half the capital invested. And it was not "a reasonable dividend" which prospectuses promised—it was anything from 15 to 25 per cent.]

Of course the writer of the foregoing has mingled apprehension with optimsim. The mining camp that returned dividends on *all* the money represented in prospectuses and promotions has yet to exist. Nor is it within the province of the Dominion Geologist to venture into high finance. At the same time, the case as presented, and as emphasized by excerpts from the prospectus quoted, suggests the necessity for a stricter sense of responsibility among those with most at stake in the Ontario mining fields. London has more scrip than it can digest. It is not inimical to Cobalt propositions. That it allowed Americans to obtain excellent Cobalt properties, it fully comprehends with regret. It was receptive toward Cobalt until recent fiascos reaffirmed the futility of buying reams of paper at 10 or 20 per cent. of its face value upon reports and estimates framed so recklessly. Undoubtedly Canadian mining districts could be made the basis of healthy speculation and exploitation, and The Canadian Mining Journal, it is anticipated, will contribute largely to that end. Mining company and syndicate regulations will not remedy the laxities. The very latitude essential in new districts makes it incumbent upon the technical and daily press to safeguard the meritorious and placard the unworthy.

ALEX. GRAY.

(Late Editor South African Mines, Commerce and Industries, Johannesburg.)

A "Foster" Specimen

Specimen from the Foster mine, in the southeast part of the north half of lot 4, concession 4, in the Township of Coleman, district of Nipissing, Ontario. Brought in by Mr. A. P. Low, July 30th, 1907. The dark steel-gray, lustrous mineral is stromeyrite, the normal composition of which as deduced by Dana is: Sulphur 15.8 per cent., silver 53.1 per cent, copper 31.1 per cent; this is the second occurrence of this mineral reported from Canada, the other being at the Silver King mine, Toad Mountain, West Kootenay, B.C. (Ann. Rep. G. S. C. vol. viii. 1895, pp. 12 and 13 R). The bronze-yellow mineral is argyropyrite, a sulphide of somewhat uncertain composition, commonly holding 25 to 30 per cent. of silver and 35 to 40 per cent. of iron, often with adventitious copper. With the stromeyrite and argyropyrite in this specimen there is also associated some native silver, the gangue being a grayish-white quartz.

Mr. Smith Curtis, in an interview with *The Rossland Miner*, last week, expressed a very favorable opinion of copper mining prospects in the Kamloops district, from which he had recently returned. Only one mine, however, is being worked at present, but good ore was being taken from this property, which had been developed to a depth of 600 feet.

A. P. LOW, DIRECTOR OF THE GEOLOGICAL SURVEY

By the Editor of the Geological Survey.

If one were to accept the views advocated by certain Canadian papers not at present enjoying the patronage of the Government, one would be disposed to believe that all positions in the Civil Service are filled by "pull," and that the recipients of such promotion have one common end in view—graft.

The Department of the Geological Survey—now officially designated the Department of Mines—has happily been practically free from political patronage, and the Minister, the nominal head of the Department, has honestly endeavoured to appoint as Director that man best fitted to fill the position.

Fortunately for the Survey, there have been few opportunities for the Minister to exercise his discretion. Logan created the Canadian Survey and raised it to a standard difficult for even such men as Selwyn and Dawson to maintain. After Dawson's death the Government determined that future Directors of the Canadian Geological Survey should themselves be Canadians. The time had gone by when we needed to send to England or Australia to find a competent Director. Scientists, Canada could supply in plenty, and scientists who, by reason of their special knowledge of Canadian conditions, were more fitted for the position than any stranger could possibly be. But a scientist—especially in these days when scientists adopt specialties—is not necessarily an administrator; indeed, it is more often the case that a scientist cannot administrate at all. When it is taken into consideration that the Director of the Survey is expected to successfully control fifty or sixty men, each of whom believes that his own brand of science ranks higher in importance than any other; and that one of the Director's principal duties is to so apportion their work over this huge Dominion as to extract the greatest benefit, both scientific and economic, while not clashing with the work being accomplished by the Provincial Surveys, it can be readily understood that a first-class Director must be not only a first-class scientist, but, above all, an able administrator.

Those who read Mr. Low's reports on his researches in Labrador or his voyage in the Neptune, were prepared to hear of his appointment to the Directorship. No one who has read these reports can fail to appreciate that Mr. Low has the two requisites that combine to make an able Director—a thorough knowledge of geology and a fine power of administration.

Mr. Low was born in Montreal on May 24th, 1861, and is believed to have succeeded in getting into more scrapes, as a youngster, than would make a good record for any two average Canadian school boys—which is a sufficiently large order. He was educated at the public schools and soon evinced so decided a taste for applied science that he was allowed to make it his specialty. He entered the Applied Science Faculty of McGill in 1878 and passed with first rank honours in Natural Science in 1882.

With his inborn love of knowledge was interwoven—as is so frequently the case—an inborn love of sports. Many of the Director's staunchest friends to-day were his friends or foes of the football field and hockey rink of many years ago. Indeed, hockey was not played at all in Ottawa until introduced by Mr. Low, and some of the most strenuous football matches ever witnessed in that town were won and lost by the Ottawa Football Club, which Mr. Low captained for many years.

In 1881 Mr. Low was appointed as a "student assistant" to an exploration party sent by the Geological Survey to the Gaspé peninsula, and from that time to the present day his work may be followed in the Survey's reports. His work—but not his life—for it has ever been an unwritten law with the Survey officers that as little as possible should be made of difficulties overcome or danger averted. In this respect Mr. Low has followed the Survey traditions with almost irritating fidelity, and only those who know the conditions of northern travel can read between the lines or suspect, from perusing Mr. Low's geological reports, what risks have been run, or what suffering has been endured. His reports, like poets,

A. P. LOW.
Deputy Minister of Mines and Director of the Geological Survey of Canada

" . . . lose half the praise they should have got,
Could it be known what they discreetly blot."

A "student assistant" on his first expedition is very carefully watched; the Survey is always on the look-out for new material. Good field geologists are scarce, for the first essential in a budding field officer is observation, and the power of observation in this age of cram is becoming, as is well known, rarer and more rare. But in this Dominion, mostly unsurveyed—except in a very superficial manner—the field geologist is practically use-

less unless he combine with his knowledge and faculty for observation a splendid constitution, large powers of endurance and a spirit of determination that, when it fails, is called pig-headed obstinacy, or, when it succeeds, unswerving persistency.

That in Mr. Low these unusual factors were combined became apparent during his first field work in Gaspé, and, on the recommendation of Dr. Ells, who was in charge of the party, he was offered and accepted a permanent position on the Survey staff.

From that time it has always been recognized that Mr. Low was in the running for the Directorship, and it was pretty generally known that to be Director became, in after years, his chief ambition. So well was this recognized that, one Christmas, some wag on the staff brought out a Christmas card containing "quotations" for the Geological Survey, and apportioned the following lines to "A. P."

"Low was his name, but great was his desire."

—*Shakespeare.*

The hit was a fair one, though it was rather unkind to ascribe the lines to our national poet, who never perpetrated anything like them.

In 1884 an expedition was sent by the Quebec Government and the Geological Survey to make a report on the Mistassini district, and especially to survey those portions of Mistassini Lake that had been left uncompleted by McEwart and Richardson. A Quebec land surveyor was in charge of the party, to which Mr. Low was attached as a geologist. The methods employed by the expedition were not such as would recommend themselves to any officer of the Geological Survey, to whom "hustle" becomes the first essential directly the flight of winter makes field-work possible. Kicking his heels in Quebec, waiting for the expedition to move, was not Mr. Low's ideal of geological research, and he started on his own account up the Bersimis River, supposing that the main party—unhampered by field-work—would soon overtake him.

He reached Lake Pipmuakin, but no main party appeared and he was compelled to return for food. Delay after delay occurred, and it was actually not until late August that the expedition at last got away. The natural consequences ensued. Blizzards caused frozen faces, frozen hands, frozen feet; food ran short, and the game that had been counted on failed to appear. The party lived for some time on starvation rations, eked out with an occasional beaver, but for which the entire expedition would have suffered the same fate as befell the unfortunate Indians last month, whose skeleton bodies lined the same route, and whose fate was made known by one of the survivors, John Bastian, who acted as Mr. Low's guide on three trips in Labrador.

The exhausted expedition eventually reached the Hudson Bay Company's post on Mistassini Lake, where they arranged to winter. From Mr. Low's point of view, everything had been disappointment. Nearly a year gone by and practically nothing done. There was, however, time to think—weeks of leisure—and Mr. Low employed it in coming to a noteworthy decision. He left the post in February, arrived in Ottawa the first of March, and interviewed Dr. Selwyn, the Director. What passed is known only to Dr. Selwyn, Mr. Low and the Minister, but in a few days Mr. Low—with J. M. Macoun as assistant—set out once more for Lake Mistassini, armed with a letter giving him complete charge of the entire expedition. But it was more by good luck than good management that these two officers ever reached the lake. Untaught by previous experience, they counted on making the average number of miles per day and on living largely on the country. Soft weather made travelling terribly slow, the game perversely refused to be accommodating, even the beavers kept away—and the two white men, with six Indians, found themselves half starved and fearfully weak at Lake Chibougamau, sixty miles from the nearest post.

It became evident that for the whole party to make a forced march meant death to some of them, and Mr. Low called for a couple of volunteers to hurry to the post with news of their plight. At the same time it was arranged that the party should move as quickly as possible along the trail, in the endeavour to save a few hours. The volunteers accomplished their mission admirably, but the starving party missed the trtil when they had followed it for some twenty miles, and were obliged to camp, in view of the danger of missing the rescuers with food. Mr. Low describes the first twenty-four hours of absolute starvation as very painful, but adds, strangely enough, that during the subsequent four days he and the men suffered very little. What was worse than the starvation was the anxiety as to whether the volunteers would be able to reach the post. On the fifth day, food, supplied by the H. B. Co., arrived. It was only flour and lard, but to the starving men it was beefsteak and onions. They made a meal that Mr. Low describes in the words of the poet Young as "an elegant sufficiency," and immediately afterwards started for Lake Wakonichi, but soon encountered more food—bacon this time—sent from the same source—and encompassed another meal, whose proportions did not seem in the least handicapped by the previous Gargantuan repast.

Crossing Lake Wakonichi the party met with its first piece of good luck. In a net set by some trapper they found a lake trout weighing nearly twenty pounds, and it can be imagined what a meal this made, cooked with flour and bacon.

Early in May the Mistassini post was reached, and Mr. Low took over charge, the first of the many that have been entrusted to him, from which time he has been regarded as the standard authority on the geology of that huge tract commonly known as the Labrador peninsula.

Of his observations and experiences in the Mistassini district Mr. Low could fill a goodly sized book and still leave much untold. In the space of this short sketch it is impossible to do more than allude to the incidents of his travels, but one fact regarding Lake Mistassini it is difficult to refrain from mentioning. On the 24th May, an Indian attached to Cleary's trading camp, left the post and crossed the lake on his heavily-laden sled. At noon Low and Macoun were paddling ice blocks in the lake, and in the afternoon A. P. celebrated his birthday by enjoying quite a long swim. The temperature was 84 degrees in the shade, and proved to be the highest recorded that summer.

The survey of the lake was completed in July, after which the party surveyed the Rupert River to Rupert House, journeyed to Moose Factory, ascended the Moose River, and eventually reached Missinabie, where the Canadian Pacific Railway was in course of construction.

In 1886 Mr. Low was instructed to find the outlet of Favourable Lake, in Keewatin, to survey the Severn River, and to return via Oxford Lake and Norway House. Prof. Macoun's son was again appointed as assistant, and together they journeyed up the Berens River from Lake Winnipeg. They found the outlet of Favourable Lake, though, if the truth must be told, they found it by accident—and followed it to Severn Lake. The season was exceptionally dry; no rain fell for six weeks,

forest fires obscured the atmosphere, taking sights became difficult, and sometimes impossible, and the travellers once more found themselves on starvation rations. For 300 miles no human being was met nor any game near enough to be shot. At last an Indian and his squaw were sighted in a canoe trying to escape notice. When called upon they endeavoured to outdistance the party, and a long chase ensued, ending, after ten miles hard paddling, in the couple being caught. They had no food to spare—scarcely sufficient indeed, to take them to Trout Lake, the nearest H. B. C. post. They were, however, induced to act as guides, and, with their help, the party arrived at Trout Lake before the want of nourishment had caused any serious harm. The Hudson Bay agent was only able to supply them with fish pemmican, which, for the uninitiated, it may be explained consists of boiled fish, dried and pounded, stored in birch-bark baskets, with, generally, a rabbit-skin holding fish oil in which to cook the appetizing concoction. Furnished with what, after their privations, seemed to be luxury, the party continued down the Severn River, but in a reach of the stream what they thought was a rapid turned out to be a fall eight feet high, and trouble ensued. The first canoe actually rode the crest and fell into the river below without upsetting or sustaining any harm. It, however, displaced some loose rocks just before taking the plunge, and the second canoe, striking these, never had a fair chance. The canoe was so badly damaged that only with great difficulty did the party succeed in nursing it to Fort Severn, but the precious pemmican was unharmed, and in comparison to that, the rest mattered little.

At Fort Severn unsuccessful efforts were made to obtain another canoe. It was decided to repair the boat as much as was feasible, and coast westward to York Factory. During this westward trip, camp was pitched at night on the dreary mud flats that characterize this portion of Hudson Bay. On the second night a storm arose that played havoc, not only with Mr. Low's tent, but with his intentions. The wind picked up one of the canoes—they had been staked down as usual—blew it across the tent, which it tore down, and damaged both tent and boat beyond repair. Macoun returned to Fort Severn with instructions to procure a boat of some sort —honestly if he could, but to procure a boat. Here again good luck intervened, for, after some days, Macoun was sighted with four Indians in a flat-bottomed boat lent by the H. B. C. The boat had been made at Fort Churchill, had drifted away and had turned up at Severn post just in time to loan to Macoun.

Though the boat made good way before a fair wind, tacking with her was a tedious business, so much so indeed that when Mr. Low shot a polar bear he was unable to capture the prize owing to the difficulty of beating against the wind. Game, however, was plentiful. Ducks, geese and caribou were easily obtained, so that the loss of the bear was not a serious matter.

York Factory was safely reached, and a river boat was obtained. Mr. Low reached Norway House just as W. H. Gilder and his party were setting out on their search for the North Pole.

From 1887 to 1891 Mr. Low continued to add to our knowledge of Canadian geology. At first in James Bay and afterwards in the country north of the St. Lawrence he made extensive surveys, the results of which, are they not written in the chronicles of the Geological Survey?

In 1892 it was determined to map the new northern boundary of the Province of Quebec. It seemed taken as granted that the officer in charge would be Mr. Low, and Mr. Low was duly appointed. He travelled north from Lake St. John to Mistassini, crossed from the Rupert River to the Eastmain River, and made the first instrumental survey on record of the western portion of that large stream. In the following year he travelled by the same route to the Eastmain River, which he surveyed to its head. Afterwards he began a series of geological explorations in Ungava, the results of which are embodied in a report officially known as Part L, Volume VIII. This publication has remained ever since, and seems likely to remain for some time, the standard geological work on the Labrador peninsula.

The party portaged to the head waters of Big River, and down it to Lake Nichikun. Thence a traverse was made to Kaniapiskau Lake; the Kaniapiskau River was followed, and subsequently the Larch and Koksoak Rivers, to Chimo on the coast.

No fuss was made about this journey, no bombast displayed, no magazines published illustrated articles with lurid head-lines. Had Mr. Low or his assistant (Captain —now Major—Eaton) died from privation, the newspaper reporters would have craved for copy and fought for photos, but as the exploring party happened to be in charge of an officer who understood the conditions, realized the difficulties, who went prepared for emergency and was fortified with experience, no lives were lost, no pathetic diaries were written, and the newspapers were too wise to fill their columns with dry geological details.

Mr. Low had intended wintering at Chimo, but a severe famine—to which nearly one hundred natives succumbed —induced him to alter his plans, and the party were conveyed by the H. B. Co.'s steamer to Rigolet. In the following March the survey of the Hamilton River was commenced. Twelve extra natives had been engaged, and each man—white and native—drew 200 pounds on a sled. Progress was necessarily slow, but after some days the spot to which canoes had been sent was reached, and the extra men were sent home. Though the Grand Falls are not the largest or the most powerful in the world, they run the Victoria Nyanza a close second, and, compared to them, Niagara is but a baby waterfall. Mr. Low first saw this magnificent accident of Nature from a cliff nearly 500 feet high. He had been warned of the irresistible desire the spectator feels to throw himself into the gorge, and had laughed. He describes his feelings, however, not as if he had any desire to throw himself over the cliff, but as if someone behind was pushing him, and, as happens to all who view this extraordinary sight, it was with difficulty he was prevented from precipitating himself into the gorge, under the belief that he was being violently shoved. The water has a sheer drop of 312 feet, but the total fall of the river here is over 700 feet, and it is estimated to give nine million horsepower. Mr. Low has pointed out the vast possibilities of this neglected power, which, there is little doubt, will some day supply the greater part of the Province of Quebec.

It was after having mapped the head waters of Hamilton River that Mr. Low reported large quantities of excellent iron ore along the valley of the Ashuanipi River and deposits of labradorite in Lake Nichikum. Labradorite is probably the most perfect and certainly the most beautiful building stone of which we have any knowledge, and in the days to come, when the valley of the Hamilton River is being worked for iron, this wonderfully streaked feldspar will be quarried in enormous quantities.

The expedition returned by way of the Romaine and St. John Rivers, having accomplished what was probably

the most interesting survey ever made by the Canadian or any other Government.

By this time Mr. Low had come to be recognized as the right man in the right place—the right place being Labrador—and he spent most of the following five years in mapping the least known portions of Ungava. As a welcome break in these desolate surveys he was sent in 1900 to the Paris Exhibition to superintend the Canadian mineral exhibit.

The continual mention in the Geological Survey reports of first-class magnetite and hematite in Labrador and on the islands of Hudson Bay had attracted the attention of American capitalists, and on Mr. Low's return from Paris he was approached by a Philadelphian Syndicate who endeavoured to procure his services in prospecting the Nastapoka Islands. Many years ago that sage observer, Hudibras, referred to

" . . . the evils that do environ
The man that meddles with cold iron."

In this case the evils were complicated, for difficult as it is to join the Geological Survey, it is almost impossible, once you play the prodigal, to be again embraced by those stony arms.

Mr. Low, however, took chances and made a detailed report on the iron deposits—he located 8,000 acres—of the Nastapoka Islands. His report has never been made public, but it is understood that though the ore was both plentiful and of first-class quality, he considered the economic conditions too unfavourable for profitable mining. Nothing, perhaps, is more to Mr. Low's credit than the fact that the Geological Survey jumped at his offer to rejoin the service, and he was immediately marked as one of the few possible candidates that could be put in charge of the expedition the Government intended to despatch to the Polar regions. Eventually Mr. Low received his commission as commander of the "Neptune," and his report of the work performed by the expedition has become an Arctic classic.

It was in connection with that report that the present chronicler first met Mr. Low, and thereby hangs a tale so good that, though Rome fall, it must be told.

Mr. Low had made certain statements which the writer in his capacity as editor—and after having consulted the Encyclopedia Britannica—queried and altered. The Arctic explorer, exceedingly wroth, interviewed the editor and told him that he might alter the expression as much as he d—— pleased, but he must not alter the facts. "Anyway," said the irate geologist, "where did you get your information?" The editor meekly explained. "Oh, great heavens!" said Mr. Low, "why go to the Encyclopedia, why not consult a specialist?" The editor brooded over this melancholy incident for some days and then wrote the editor of the "Times," asking why the information was not up-to-date. He received a letter to the effect that though the "Times" was not responsible for every sentence written, it endeavoured to ensure accuracy by inducing specialists to write, and, in this case the article was supplied by the well-known Labrador explorer, Mr. A. P. Low.

The report of the voyage of the Neptune, Blue Book though it was, differed so materially in style and manner from most other Blue Books that the Government decided to publish it in an *edition de luxe*. Seven thousand copies were issued, but the demand was so great that before the wholesale booksellers could be supplied the entire edition had run out.

Among the many conclusions arrived at in the "Voyage of the Neptune" the following are probably the most important, and the reasons that led to their adoption are very forcibly argued by the author:

1. The discovery of the North Pole, except as a matter of sentiment, is absolutely useless.

2. With plenty of good luck, the North-West passage can be made, but will never be a commercial route.

3. The Hudson Bay route for wheat to Europe is not only practicable, but is bound to be adopted in the near future.

4. Unless the Government take strong measures, the Eskimos are a doomed race.

In 1905 the Quebec Government requested the Dominion Government to instruct the Geological Survey to make a report upon the mineral areas in the Lake Chibougamau district. Accompanying the request was a rider to the effect that of all the field officers in the survey, Mr. Low would be the most acceptable. Mr. Low, accordingly, was sent. His report could scarcely be considered a very comforting document for those deeply interested in Chibougamau mining, but the author expressed the opinion that further prospecting and cheaper transport may develop something really profitable in copper and asbestos.

In April, 1906, Mr. Low was appointed Director of the Survey, and immediately started on a stretch of hard work that came near to being his undoing, both physically and mentally. Late hours at the office and an attack of "grip" were the cause of the evil, and in January last Mr. Low was reported dying. But the constitution of a giant and the pluck that had pulled him through so many narrow escapes came to his rescue and after a month's anxious waiting the Survey heaved one big sigh of relief when the daily bulletin read "out of danger."

The illness has left its mark. The remarkably youthful appearance that characterized the Director is no longer seen—

" . . . . . . middle age
Has slightly pressed its signet sage."

But, fortunately, this is all. The clearness of thought is still there, the ability to decide quickly what line to take, and the determination to take it and stick to it are still there; above all, he still retains the friendship and respect of the staff—who, as one of them remarked the other day—would "work their fingers to the bone to do old Low a turn."

"THE TRUTH ABOUT WABANA"

Shipped, in good order and condition, in and upon the good ship Sommerstad, now lying in the port of North Sydney, whereof Ellefsen is master for the present voyage, and bound for Wabana, the parcels, marked as in the margin, "(*a*) Perishable, handle with care; (*b*) irascible, handle gingerly, to avoid explosion." Bills lading, in general, do not make provision for details, so it may here be explained that the so-called "parcels" were "valuable," inasmuch as they consisted of the writer and his better half. Contrary to accepted, if not strictly correct rule, the first named, in the present case, will do all the talking.

Wabana, made famous by its iron ore, is the chief port of Bell Island, an island in Conception Bay, which in its turn is in Newfoundland. Wabana is in N. lat. 47′ 37, and W. long. 53′ 56. It is distant from Sydney harbor about 400 miles; from Halifax, about a hundred more,

and from St. John's, Newfoundland, a very short distance. Leaving Sydney harbor, the course is straight south for Cape Race, then along the coast, past St. John, and then turning a corner, at Cape St. Francis, Bell Island, is visible; that is, when there is no fog, which I believe is seldom. This description as to the whereabouts of the famous isles should be comprehensive enough to satisfy the ordinary reader; the extraordinary may obtain fuller particulars in an admiralty chart.

I had heard some fearsome stories as to the difficulties attending a landing on the island—not on the pier, which can be reached by a land ladder—and so, as I had come with the intention of seeing the ore mines, I had made up my mind to "play the game," no matter how many or how great the obstacles. Pshaw! It was dead easy. I had been told people were taken up in a basket on the sides of precipitous cliffs. The cliffs were there all right, but the basket was absent. Instead there was a platform, as in an elevator, only more original in design. If in an elevator an ascensionist happens to be a giddy person, he cannot well fall out, walls and bars prevent him. The platform at Wabana, not being ornamental, has on its sides two iron rails, while its ends are open. The ascent is easy and pleasant; the descent, as one sees the abyss below, may not be so cheerful. We went up on the elevator and down by the stairs—for there are these as well as the elevator, and by the time the bottom was reached one of the party was wet with sweat.

Of Bell Island it cannot be said that it is a lonely island. Before the Nova Scotia Steel & Coal Co. set foot there it was a well populated and a well cultivated island. There were some five hundred families on the island making a living by fishing and farming when the Nova Scotia Steel & Coal Co. set about the development of the island's iron ore. The population now is probably 3,500 to 4,000, as in addition to the original inhabitants there are employed in connection with the mines some 1,400 or 1,500 persons.

There are two popular impressions in regard to Bell Island which are erronous. The first, that it is a much out of the way place, and the second, that the whole island is a mass of iron ore. With regard to the first-named, it may be stated that, when good connections can be made, St. Johns can be reached in two hours. The distance is, say, thirteen miles, four by water to the mainland and nine by coach to the capital. As to the second wrong impression, Bell Island has less than a fifth of its surface laid or underlaid with ore. I use the two words advisedly, as one of the beds lies chiefly on the surface; the other underlies it some two hundred and thirty or forty feet. The island is, say, eight miles long by two wide, while the iron ore covers an area of three and a quarter square miles. As yet, if hopes do not fail, and if prospects are not foiled, the quantity of ore in these three odd square miles will form a small proportion only of the ore which will find an exit by way of the island, for, while both the steel companies may have between them thirty to forty million tons of ore available on the land areas, it is hoped that that is only a bagatelle in comparison with the quantity in the submarine areas.

Before leaving Nova Scotia, one indirectly interested in the Torbrook, or Nictaux, iron mines, said: "See now that you write a good article and head it, 'The Truth About Wabana.'" Well, that's what I "lay out" to do, without entering into bonds as to the goodness of the article.

There are the principal seams of ore, marked the upper and the lower bed. The upper bed is the one so much has been heard about, owing to the facility with which the ore was mined, as it lay largely on the surface, or with a slight covering of earth only, removable at some points by hand, at others by a steam shovel. Though a large quantity of the surface ore has been removed, much yet remains. Both companies, however, are developing to the deep by slopes, preparing for the future. The thickness of the beds is, say, nine feet, divided into two layers. The under layer of at least one of the seams is not quite so high in iron as the other. On the land areas of the Nova Scotia Steel & Coal Co. it is estimated there are twenty millions of tons. To be safe, let me say fifteen millions. But, as said, it is hoped that is only a patch in proportian to what is in the submarine areas. The outcrops of the seams run east and west, and the pitch is northerly. The angle or the dip of the seams is about eight, or say a foot in twelve or thirteen. To the north, between the island and the mainland, the distance is eight miles. It is not supposed that the submarine ore areas continue on to the mainland. Indeed, it may be said it is known they do not, but there is no reason why they should not continue under the water for four, five or six miles. It may be asked: "Beyond the fact that the seams pitch seaward, is there ground for the supposition that the ore underlies the water?" There is. Through a portion of the lower seam, owned by the Dominion Iron & Steel Co., the Nova Scotia Steel & Coal Co. are now driving, by mutual agreement between the companies, a slope to determine this point. The present length of the slope is some 1,600 feet through land ore and 1,200 feet through ore submarine. And the beauty of it all is that as the sinking progresses the thickness of the seam increases, and the quality of the ore improves. At the outcrop the ore is six feet in thickness; at the face of the slope the thickness is no less than 15 feet. At the outcrop the ore runs from 49 to 52 per cent. of iron; at the face analysis gives 56 per cent. In answer to a question put to Mr. R. Chambers, the best-known iron ore explorer in the Lower Provinces, and the indefatigable, it may be said enthusiastic, superintendent of operations at Wabana for the Nova Scotia Steel Co., as to whether faults or obstructions had been met in the sinking, the writer was informed that under the sea the seam was as regular as on land, and nothing had been encountered to indicate that the seam might not continue for miles under the water. "In that event," said Mr. Chambers, "we will have to figure the quantity of ore out in the hundreds of millions of tons, instead of the millions merely. Of course," said Mr. Chambers, "having examined the land on the other side, and having noticed a disturbance of the mineral, we do not suppose that the ore carries to the main island, and at just what point it stops short it is for the future to decide; but I am in high hopes that there is ore here for all possible requirements for many generations." I did not ask—my memory slipped me—why it happens that the Nova Scotia Steel Co. were driving the slope through the Dominion Iron & Steel Company's area, but I presume the sufficient reason is that where the former company's upper seam enters the water there is no, or not sufficient cover. This may be apparent from the fact that the cover at the face of the lower seam is not much over 200 feet. Bye and bye there will be sufficient cover to justify tunneling to the upper seam.

Many people imagined that until very recently it was all surface shovelling, and not mining at Wabana, and some, one almost thought gleefully, declared that the companies, from this out, would have to "mine" their ore and pay higher for it. Well, there is still much ore on the surface, but the companies wisely are reserving

it for contingencies, while they are not proceeding to win the ore by way of slopes from the "deep." As to the increased cost of mining, the writer, from observation merely, would come to the conclusion that it is infinitesimal. The cost of pumping will be almost nil, if it will be anything, as water is the scarcest commodity in Wabana. It runs off into the sea. The cost of timber will be trifling, as there will be few levels or old places to keep up. In short, there will be few extra expenses in operating toward the deep, the chief one being haulage, and as the systems employed are modern, the cost is trifling. The ore which cannot be procured by quarrying is mined in much the same manner as coal. There is, of course, no undercutting or shearing; it is blown from the solid. The system of mining is modified board and pillar. The levels and the rooms may run uniformly, the modification consists in the lack of uniformity in the size of the pillars. Some are large and others are small. After the rooms in a section have been worked out, the pillars are drawn and the place abandoned. Numerous small engines are employed underground for haulage purposes. In proportion to the number of men employed, the tonnage produced in an ore mine is much larger than in a coal mine. For instance, the total number of men employed at Wabana by the N. S. S. & C. Co. is 671, and the quantity of ore produced is fourteen hundred tons per day.

At the slope mouth there is much of the machinery to be found at a coal mine—compressors, fan, tubular boilers, etc. All the ore on coming from the mine goes through a crusher. Though about fifty per cent. is in small pieces enough, all goes through, as all has to be picked just as carefully as is coal. The ore from the crusher is discharged on a very wide rubber belt, which carries it up at a surprisingly heavy angle. At it passes up, the ore is cleaned by pickers stationed at the sides. In the winter time the ore is put on bank, at a very small cost. Only one man is employed on the bank—the man who operates the engine which hoists up the boxes containing the ore. Self-dumping boxes are therefore employed. On the property there are two mines, Nos. 1 and 2. Overground there is an excellent system of endless haulage for conveying the ore from the mine to the pocket at the pier. A tramway from each mine runs parallel with the outcrop, the main tramway at a right angle. The boxes are of iron, and their capacity close on two tons. The tramway can readily convey two thousand tons of ore daily to the pocket, of which fourteen hundred tons come from the mine and six hundred from the bank. The engine for operating this haulage is situated at the pier. There is only one pocket, but it is large enough to contain no less a quantity than twenty-four thousand tons of ore. In the construction of this big pocket nature played no secondary part. The floor only is artificial. The sides of the high cliffs form the sides of the pocket; the face is exposed. It is of great height. A door in the floor permits the ore to fall on the conveyor, by which it is carried to the chute at the pier and emptied into the vessel. The stream of ore into a vessel's hold is continuous. In twenty-four hours it would be an easy matter to empty the pocket of its twenty-four thousand tons. But for the delay in shifting the steamer, so that each hatch may come under the chute, a six thousand ton steamer could be loaded in about three hours. Wabana is a magnificent asset of the Nova Scotia Steel Company, and like the other branches of the company's undertakings, is splendidly managed.

R. D.

CORRESPONDENCE

To the Editor THE CANADIAN MINING JOURNAL:

Sir,—I have read the leading article in your issue of Aug. 1st, entitled "Another Suggestion," with astonishment, that THE CANADIAN MINING JOURNAL, which at the special request of its publishers was constituted this spring the official organ of the Canadian Mining Institute should be guilty of insinuations, which are not only largely unwarrantable, but are likely to be injurious to the organization whose interests you are expected to conserve. One would at least suppose that any editor of a publication of standing, in a matter such as this, would be careful to make sure of his ground before making what can only be construed as a criticism of the efficiency of the Institute's officers; while in the case of an "official organ" the neglect in this respect is the more to be wondered at—leaving the question of common courtesy out of the discussion altogether. I have no doubt, sir, that your intentions were excellent; but what an awful bull in a china shop is often the well meaning person! Please, meanwhile, believe that in replying to your article I have no desire nor intention of excusing or denying sins of omission or commission which may be laid at my door. I am perfectly well aware that they are many; and any man having to follow the lead of such a one as the late Secretary, poor B. T. A. Bell, must necessarily appear at a disadvantage. But as a member of this Institute of seven years' standing—very nearly constituting me an old-timer—I do protest against the tone of the two editorial articles, in your issues of July 15th and Aug. 1st, respectively, wherein you to all intents and purposes insinuate that except for its annual meetings the Institute is ineffective and ineffectual. If I were not the Secretary I would go for you without gloves; but the trouble is in defending the Institute against this allegation, I must necessarily appear to be defending myself, for your statement to the contrary notwithstanding, the Secretary is the one responsible official. He is expected to do rather more than just "keep a true and correct record of all the proceedings of the Institute" (not to mention the seal); and the council, composed of busy men, look to him to initiate work and practically carry on the business of the Institute, subject, of course, to their confirmation and approval. So if things don't move it is no one but the Secretary's fault. But aren't they moving, or so very slowly as you would suggest? The best day's work ever done for the mining industry of this country was the establishment of a Federal Department of Mines, for which, I submit, this Institute was chiefly responsible—and that was an affair of national, not mere provincial importance. Then there have been, in the last two years, other deputations to Ottawa in connection with other important questions affecting the welfare of the mining industry; and in each instance the Institute has been fortunate in exerting a useful influence.

You, however, cite as an example of neglect the case of the "Mines Taxation Act in the Ontario Legis-

lature last winter," and remark that "the Government emphasized forcibly the fact that nothing had been heard from the Institute until the bill had been for many months before the House." As a matter of fact, a deputation did interview the Hon. the Minister of Mines, Mr. Cochrane, on the subject of the Bill several weeks before the Annual Meeting, and I believe, too, the Toronto Branch also took action; but knowing that the Bill would not pass the House until after the Annual Meeting, it was deemed best to postpone definite action till then, in order that a protest might come from the Institute as a body. The result was we got an association of representative and disinterested men a better hearing from the Ontario Government than was accorded any other body or deputation representing Boards of Trade or individual interests, and we have Mr. Cochrane's definite assurance that he will introduce an amendment to the Act in 1908, upon a certain understanding with the Institute, and for the carrying out of which condition the Institute has already and is now taking steps.

Now, on the score of membership. It is not the policy of the Institute to go into the by-ways and hedges to secure new members; on the contrary, the standard of membership has been raised. But the growth in this respect in the past two years is distinctly gratifying and all that could be reasonably expected. Thus if you will refer to the "Report of the Council for 1906" you will note that the increase of membership last year was over 20 per cent; and this year I have every reason to expect we shall do just about as well. Not so bad surely for an organization that "without doubt needs revivifying"?

Finally, I submit for your information as the "official organ" of the Institute a few facts of which at present you appear ignorant; although the first is readily ascertainable by reference to the published accounts of the Institute for the past few years. While the by-laws state that the Secretary shall be remunerated at the discretion of the Council, this does not, as you intimate, "render his position insecure and in certain matters weaken his hands," since the salary of the Secretary is definitely fixed at a certain figure, payable monthly, which he is entitled to draw so long as he performs his duties. The provision of the by-law is an admirable one, since it affords the only means by which the actions of the Secretary may be controlled by the Council. The Secretary, moreover, is not restricted, as you would appear to believe, in the matter of travelling expenses; but he travels at the expense of the Institute whenever the occasion warrants. Thus already this year visits have been paid to various mining centres in Nova Scotia, several of those in Ontario, one in the Province of Quebec, while this month the Secretary leaves for Alberta and British Columbia, expecting to be absent six weeks on the Institute's business, including attendance at a Sectional Meeting of the Institute in the West.

I trust, sir, that these explanations will enable you to somewhat modify your views. It might possibly be an advantage if the Secretary were in a position to devote his time exclusively to the work of the Institute, although he can conscientiously say that the interests of this organization are now and always his first thought and care. Meanwhile the Institute is growing in strength and influence; it is developing with the development of the mining industry, and I am sure there are many ways by which THE CANADIAN MINING JOURNAL may aid and stimulate present progress without giving expression to ill-considered and undeserved criticism.

Yours sincerely,

H. MORTIMER LAMB,
Secretary.

Toronto, July 22nd, 1907.

To the Editor THE CANADIAN MINING JOURNAL:

Sir,—As a shareholder in the Cobalt Lake Mining Company I desire to thank you for your vigorous, fearless and outspoken leading editorial on the Cobalt Lake embroglio in your issue of July 1st.

The answer of one of the Directors given in your issue of the 15th is, at any rate to me, entirely unsatisfactory. Whoever the Director is, it is quite apparent he is not willing frankly to take the shareholders and the public into his confidence. The pertinent question is, "What explanation can be given of this extraordinary transaction?"

It seems to me unexplainable why these trustees, such as your Director mentioned, should pay such an enormous sum of money to the Government and not secure a good title to the property, but merely a lawsuit.

When adverse claims to the property were pressed in the court, a member of the Ontario Government stated to the Legislature that the Government had not guaranteed the title of our company to Cobalt Lake. Some explanation of this should be obtained, and also as to why it was necessary to pass a Special Act, which seems to have complicated matters worse than ever.

Can the Director in question truthfully say that shareholders like myself were made aware that one hundred and forty thousand shares were distributed amongst a number of men who did no more for the company than is usual in such cases.

The large amount of money which the stock they received represents demands very important services, and I would like to know what they did for the one hundred and forty thousand shares, and why they should have received stock for nothing, or at thirty cents, when unfortunate investors had to pay eighty-five. The fortunate Directors may well afford to look with complacency and contemplate a profit from the stock obtained at our expense, but the bulk of the investors are, I think, those who, like myself, are mourning without hope of ever getting our money back. I am,

Yours truly,

A SHAREHOLDER.

To the Editor THE CANADIAN MINING JOURNAL:

Dear Sir,—I noticed in your last issue a contribution from E. Percy Brown, S.B., on Nova Scotian gold mines, in which he gives much valuable information and corrects some erroneous ideas. For this I thank him, confirming as they do, my conclusions of several years ago on deep mining in Nova Scotia. I would have been glad had the whole article been devoted to such practical points as the direction and permanence of pay streaks. Though he refers to me in somewhat flattering terms, I feel it my duty to call attention to some references to gold stealing which I consider much exaggerated. He writes, "Miners have assured me that they believe," "I have reason to believe," "I

have been told," etc., thus showing the source and value of the assertions on this subject. The statement that more gold was stolen by the miners than obtained by the owners is without doubt an exaggeration by Mr. Brown's informant, as only by taking the most of their working hours is this possible in even a good mine. And when we think of a stream of water large enough to wash the ore piles in the stopes clean enough to make the gold visible in the candle light, it conjures up visions of immense pumps and mountains of machinery. A moment's thought should convince one that water would run under the ore, and not over it, and a mucker who used his time in washing ore, instead of working, would doubtless find his place vacant ere long. The deckman who sorts the ore in broad daylight is probably the chief offender in this respect.

He says that the phrase "Miners' rights" was commonly used, and meant that the miners thought they had a right to all visible gold and the owners to the rest. Now, I have spent 35 years of my life in Nova Scotia, working in every gold district except a few, and at all branches of gold mining, and have not yet heard the expression "Miners' rights." I must therefore conclude that this idea exists only, or chiefly, in a few mines in the extreme east of the province, where my experience has been limited. Mr. Brown should know that there has been for many years a gradual weeding out of the characters referred to, the most of whom are now scattered over the continent, from Klondyke to Mexico. Nova Scotia's unexampled record, a few years ago when prohibition was an issue, as well as the low criminal record of the province, should convince the most prejudiced that its moral standing is among the highest. The census reports should also contain figures available for comparison, and I would ask Mr. Brown, as a misinformed friend, to consult them before diving into generalities. Had I not spent nearly a lifetime of experience in all possible positions among the gold miners of Nova Scotia, I would not have attempted the slightest correction of his statements. The 1,000 or so of Nova Scotian miners in Cobalt district, with a few exceptions, are set down as an honest, hard working class, well used to wet mines and other hardships, and are eagerly sought for where once tried.

But much as this crime deserves the strictest laws for its suppression, it is an old-fashioned sin, doomed to dwindle under the scientific and systematic methods of our time. These poor guilty devils know not how to pad pay rolls, get rebates on machinery ordered for their employers or make false reports on mines they are commissioned to examine. They listen in unfeigned ignoance to tales of stock watering, missuse of reserve and depreciation funds, and intricate semi-legal plans for freezing out poor partners. When the financial giants of the continent cause ruin and suicide in their struggle for cold cash, these common old-time thieves are not in it, and their feeble and dishonest efforts are rewarded with contempt by the honored manipulator who has made a million by selling stock in a worthless mine.

Nevertheless, with Mr. Brown I would welcome the advent of laws making gold stealing in the old, old way more difficult; but we hope that this is a dying sin, and probably will not survive the introduction of more legal and enlightened methods in the same line.

Now, Mr. Brown may not, and probably did not, intend to blacken as a class the characters of the many small, quiet and orderly mining communities scattered over the province, but his outspoken opinion published in such an influential journal as yours should, in fair play, be allowed an equally outspoken defense. The moral standing of these places can be ascertained by an examination of the county criminal records. These few lines are written in defense of a class, judged by exceptions, and who (as I know) feel deeply hurt by this unjust reference to them.

With an apology for the use of valuable space, I am,

Yours truly,

W. H. PREST,
Imperial Cobalt Mine, Cobalt.

To the Editor, CANADIAN MINING JOURNAL:

Sir,—In your editorial on the Canadian Mining Institute in the last number of THE JOURNAL, you aver that this Institute is, at the present time, not occupying the important position in the life of the country which it might be expected to occupy, considering the magnitude of Canada's mining interests.

While such may possibly seem to be the case, we must recognize that the Institute has done and is still doing a great amount of good work. At the meeting in the King Edward Hotel, Toronto, last March, a number of excellent papers were read. That these papers have been very generally appreciated is evident from the fact that a large number of them have since been reproduced in some of the leading mining journals in America and England. In this way the beneficial effect of the meeting is certainly being diffused throughout the whole mining population of the Dominion, perhaps more effectively than could be done by any other means, and many of the papers would probably never have been written but for the incentive offered by a gathering of sympathetic men who could be depended upon to appreciate the work of the writers.

Since the date of this meeting there is good reason for a period of quiescence, for in Canada the summer season must of necessity be the time when the busy mining engineers have the least leisure that their disposal to devote to the preparation of papers and plans descriptive and illustrative of the work that they may have been doing, or to the careful elaboration and logical deduction of general principles derived from their experiences.

The vitality of a society or institute depends largely on the opportunities which it affords for the comparison of notes and observations, and winter, rather than summer, is the season when these comparisons can most easily be made. It is also noticeable, too, that in years of special activity in mining the mining men have less time and thought to give to the general culture and elevation of their profession than in years of greater quietude.

In a country so extensive as Canada, it would seem to be quite impossible to get mining men together more than once a year, but at the annual meeting something more might be done to encourage acquaintance and good-fellowship among the members so collected together. An album might be formed each year with the photographs of all the members attending, or numbered buttons might be given out, as in many American societies, and printed or typewritten slips distributed which would give the names of the members opposite their respective numbers. Some such plan would be very useful in assisting in friendly intercourse.

Members living in Montreal doubtless derive great benefit from the library and rooms on Dorchester street

in that city. It is impossible that these rooms should be of very general interest to most of the members, scattered as they are from the Atlantic to Pacific, but the Institute must have some established home, and members living in other cities, such as Toronto, would be greatly benefited by the formation of local clubs, where opportunities for mutual intercourse and improvement would be afforded. I would suggest that the necessary steps be taken at once for the formation of such a club in this city.

The question raised by you of the amalgamation of the two offices of secretary and treasurer in one, and of the emoluments to be paid to one or both of these officers, hardly comes within the bounds of general discussion and might well be allowed to stand over until the next annual meeting of the Canadian Mining Institute.

Yours truly,

J. B. Tyrrell.

Toronto, August 8th, 1907.

EXCHANGES

The British Columbia Mining Record, June, notes the payment of dividends by five mining companies in British Columbia. *The Record* contains a very large amount of interesting information concerning the Province.

The *Journal* of the Franklin Institute, July, has a paper, interesting from both historical and technical points of view, on the Schuyler mine. The copper deposit was discovered by a negro slave in 1715, near Kingsland, new Jersey. Old records mention a shipment of ore in April, 1721, to Holland.

The *Proceedings* of the Cleveland Institution of Engineers, for March, is devoted entirely to a paper written by Mr. Robert Buchanan on "Principles and Practice of Foundry Work." In a section on liquid and solid contraction, the writer reaches the conclusion that both depend almost wholly upon the quantity of carbon which takes the graphitic form.

The South African Mines, Commerce and Industries, June 22nd, speaks of the Rand's poor return to investors. "After deducting from the dividends the amount of £3,728,363 due on amortisation account, there remains the sum of £1,837,609 as interest in the investment. This represents a small fraction over 3 per cent., and is totally inadequate as a mining return."

Ralph Stokes writes of "Mining in the Boundary Copper Field" in *The Mining World* of August 3rd. "There are different types of ore in the district, but infinitely the most important is that marked by the presence of magnetite, in association with chalcopyrite, pyrite and specular iron." In the same number Matt. W. Alderson begins a series of articles on "Practical Points for Prospectors."

"The Chemistry of the Iron Blast Furnace," by Bradley Strughton, a resume of the reactions which take place in reducing iron ore to pig iron, appears in *The Engineering and Mining Journal,* August 3rd. This article is an excellent example of condensation and clarity. Its acceptability accentuates the need, mentioned before in these columns, of a thoroughly complete and up-to-date text-book on the blast furnace.

"Coal and Wages" is the title of a leading editorial in *The Iron and Coal Trades Review* of July 26th. Pointing out the fact that the increase of the demand for British coals and their consequent jump in price may be but temporary conditions, superinduced by a growth in German domestic consumption and the consequent failure of Germany to supply its neighbors' demands, *The Review* deprecates the demand of the miners for a further increase of wages.

The Colliery Guardian, July 26th, in an editorial on the annual report of His Majesty's Inspectors of Explosives, alludes to the absolutely reckless disregard shown by miners for the precautions as to thawing nitroglycerine. Note is made of the influence of traces of mercuric chloride upon the official heat test, and the conclusion is drawn that to the lack of chemical stability due to carelessness in manufacture many hitherto unexplained accidents may be attributable.

Mines and Minerals, July, presents a leading article on the "Lead-Silver Deposits of Mowry, Ariz." The caving system of mining is used at the Mowry, and 80 per cent. of the ore is won without timbering. One disadvantage is that only one level can be stoped at a time. "The Panel Retreating System" for mining thin seams of anthracite is the subject of another article. A comparison of costs shows that this system can be used at a cost of little more than a third of that of the pillar-and-chamber system.

A valuable and interesting paper, "The Systematic Treatment of Metalliferous Waste," by L. Parry, A.R.S.M., is given in *The Mining Journal* of August 6. Mr. Parry states that so far as he is aware there is no works in existence which treat any and every kind of metallic by-product and waste. There are establishments where certain special classes of waste are treated. But there is much waste of a very complex character, which, because of the lack of facilities for treating it, has a commercial value far below its intrinsic value. Mr. Parry then develops his scheme of treatment. Further articles are to follow. These should be of interest to smelters of Cobalt ores.

In *The Engineering Magazine* for August appears a well-illustrated article on "Copper Smelting Practice in the Boundary District, British Columbia," by Frederic Keffer, president of the Canadian Mining Institute. In describing the Boundary copper ores, Mr. Keffer states that they display a wide range in composition. Neutral ores, however, predominate, and neutral mixtures of divergent ores may be had without the addition of barren flux. As most of the Boundary ores contain lime as crystallized calcite, they break up readily in the furnace and thus obviate the necessity of crushing finer than 4 inch to 6 inch diameter. The Boundary ores run from 1 to 3 per cent. in copper, the average being about 1 1-2 per cent. They also carry from $1 to $3 per ton in gold and silver.

The editor of *The Mining and Scientific Press* concludes, in the July 20th number of that journal, his notes on "Guanajuato. For sheer readability, conjoined with technical interest, these editorial articles are unique. The last paragraph is musical: "But beyond the mental imprints that it has been my endeavor to transfer to the pages devoted to this account of a journey in the southern land, I brought other memories and experiences, which were never developed; they remain blurred, and to none but myself have they a meaning. I have recollections of multi-colored facades; of sunlit walls, and cool patios, the sound of bells, and the crackling of whips . . . a stream of chocolate-colored humanity, a politeness that gave dignity to the commonplace, a squalor that soiled romance, and a sunshine that glorified everything." Mr. Rickard's letters should assuredly be collected and published in book form. They are worthy of a permanent place in technical literature.

PERSONAL AND GENERAL

Mr. J. Burley Smith, of Montreal, sailed for England on July 20th.

A mining recorder's office has been opened at Larder, in charge of Mr. J. A. Hough.

Professor Woodman, of Dalhousie University, has been rusticating for a long time at No. 6 colliery.

Dr. James Bonar, of Ottawa, has been appointed deputy master of the Royal Mint at the Capital.

Mr. C. E. Star is acting as temporary general manager of the Letete Gold Copper Company, at Letete, N.B.

Messrs. Simonds & Burns, mining engineers of New York, recently opened an office at Haileybury, Ont.

Dr. S. Petersky has been appointed medical superintendent of the Miners' Union Hospital at Sandon, B.C.

Mr. Hugh Fletcher, of the Geological Survey, has been registered at the Glace Bay Hotel for the past few weeks.

Mr. F. C. Laird, manager of the Willow River Mines, Carbiboo, B.C., has returned to Barkerville from a visit to the East.

Dr. H. S. Poole has returned to Halifax from a visit to the south of England, where he spent six months in geological research.

We regret to learn that Mr. G. Herrick Duggan, general manager of the Dominion Coal Company, is suffering from a severe attack of tonsilitis.

Dr. Frank D. Adams left for London last week to attend a meeting of the Royal Society, of which he was recently elected a Fellow.

Mr. Thos. Mills has resigned the mine management of the Western Fuel Company's No. 1 and Protection Island collieries at Nanaimo, B.C.

Mr. W. A. Aldridge is again visiting the East on the Consolidated Mining & Smelting Company's business, and expects to remain some weeks.

Mr. Chas. Rundsberg, formerly of Salt Lake City, Utah, has been appointed superintendent of the Dominion Copper Company's mines at Phoenix, B.C.

The engagement is announced of Miss Florence Mary Fenwick, of Kingston, Ont., to Mr. DeLorme Donaldson Cairnes, M.Sc., of the staff of the Geological Survey of Canada.

Mr. P. Davison Ahier has been appointed superintendent of the Cariboo-McKinney mine, at Camp McKinney, B.C. This property is now being operated under lease.

Mr. A. J. MacMillan, managing director of the Le Roi Mining Company, Rossland, B.C., returned to British Columbia at the end of July from a visit to England on the company's business.

Mr. J. W. Astley, formerly manager of the Le Roi mine at Rossland, has decided to make Victoria his permanent headquarters, and has opened an office there as a consulting engineer.

The Hon. Robert Drummond is at present on a well-deserved holiday on the other side. He is visiting the Scottish Lowlands and seeing England, in addition to a short trip to the continent.

Col. John Weir, one of the principal members of the original syndicate who purchased the Mother Lode mine in the Boundary district, which was subsequently acquired by the British Columbia Copper Company, has resigned from the board of that company, and is succeeded by Mr. A. N. Brady, of New York.

Mr. W. C. Mitchell, of Chesterfield, England, has been appointed superintendent of the Dominion Iron & Steel Company, Sydney, C.B., in succession to Mr. C. H. MacMillan, who recently resigned.

Mr. W. Morley, of Sydney, has been elected president, Mr. W. F. Jennison vice-president, and Mr. A. N. MacLennan secretary-treasurer of the Cape Breton Prospecting, Mining & Development Company.

David Noble, B.Sc., a graduate of the Kingston School of Mining, was drowned in the Kootenay River on August, 4th. Mr. Noble was employed in the chemical department of the Consolidated Company at Trail.

Mr. J. H. McDonald, general superintendent of the West Kootenay Power & Light Company, reports that the company's new power building ata Bonnington is now completed and the two units of 8,000 horse-power satisfactorily installed.

Mr. J. B. Hobson, the manager of the Guggenheim syndicate's hydraulic mine at Bullion, B.C., is on his way to New York to interview his principals. Mr. Hobson has refused to give the press any explanation for the suspension of operations at the mine.

Mr. W. Fleet Robertson, the Provincial Mineralogist of British Columbia, who has recently inspected the Nicola, Similkameen and other districts in Southern Yale, reports a strong revival of interest in mining in the Province. The Department is now receiving a very large number of letters of enquiry from prospective investors.

It is stated that a great deal of American capital is now being invested in copper mines in the Whitehorse district, Y.T. A number of properties have been recently examined by Mr. W. Thomas, formerly consulting engineer of the British Columbia Copper Company, and said to be at present representing the Standard Oil Company.

Mr. Hiram E. Donkin, C.E., has been appointed to the position of Deputy Commissioner of Public Works and Inspector of Mines for the Province of Nova Scotia. Mr. R. D. Anderson, of Glace Bay, will probably be appointed Mr. Donkin's assistant. Mr. Donkin has been fitted for his new duties by long experience in railway construction and mining in Nova Scotia.

Mr. J. C. Haas, one of the pioneer engineers of the Boundary district, but now practicing as a consulting engineer at Spokane, Wash, has gone north to examine a copper property at Bella Coola. In an interview Mr. Haas expressed the view that there was at present an inclination among capitalists in the United States to engage in mining undertakings in British Columbia, and he anticipated a revival of interest and activity in the Province's most important industry.

Mr. George Blake Walker is at present visiting the mines of the Dominion Coal Company. It will be remembered that, in conjunction with Mr. Emerson Bainbridge, he inspected the properties of the Coal Company in the summer of 1904, and again in 1905. Mr. Walker is recognized as eminent in his profession over in England, where he has always been known as a most progressive mining man. He has always taken a great interest in life-saving apparatus, and it was very largely owing to his exertions that the first Joint Rescue Station was erected at Tankersley, in the South Yorkshire coal field, and his name appears under the report of the South Yorkshire Coal Owners' Association on this matter in the first report of the Royal Commission on Mines, just published by the English Home Office.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Springhill.—In June of this year the employees of the Cumberland Railway Coal Co. made application to the Government for a Board of Arbitration and Investigation to investigate the causes of dispute between themselves and the Company. The Board, after patiently hearing the evidence pro and con, gave one, the most important case, against the Company. The other, or "local stone" question, against the men. The men, or a few at least, were dissatisfied with the finding of the Board. A further advance on current rates was demanded. It was promptly refused, as they must have known it would be. The men promptly applied for a further reference to the Board, which the Government granted. Meantime the lodge of the P. W. Association in connection with the collieries' notified the management that unless they conceded that which the Board withheld they would strike on the first day of August. The second board was composed of R. B. Murray, representing the workmen, and E. C. Archibald for the Company, with Judge Patterson, an appointee of the Government. The two representatives failed to agree in choosing the third man, so the aid of the Government as per Disputes Act, was invoked, and the Judge was appointed chairman. The Judge called the court to order and the workmen's side of the case was heard, and all evidence taken. The court then adjourned till next day (Aug. 1). August first the strike was on. The Board met as per adjournment, but the Judge, whose dignity forbade participation in a farce, promptly dismissed the Board on finding the men were on strike. It is a very unfortunate situation. The Company has at last taken the stand long expected. The prevailing average wage where the demand for advance was made, is $3.41 per day of ostensibly eight hours, but which is really earned in six hours. The Company thoroughly understand the conditions and will unquestionably concede nothing in the way of advance. The men have lost public sympathy through ignoring or repudiating the finding of the Board, formed on their own application. The situation is a most serious one for Springhill and its people.

Springhill mines were never in better or safer condition. The output from the collieries had attained normal condition and was steadily increasing, after the winter's experience of gob heating in No. 3 mine. This latter condition was overcome and the section cooled. The full force of men was again at work and doing well.

Springhill is a town with but one industry.

W. D. M.

Glace Bay, August 1st, 1907.

Dr. Ami, of the Geological Survey, is down here from Ottawa, and he is exciting much astonishment to the lay mind by his avidity for fossil remains. He says that the Glace Bay coal field is surprisingly rich in paleontological fauna and flora, and that in particular its wealth of animal remains is such as to rejoice the eyes and glad the heart of a paleontological geologist.

It is, of course, a well-known fact that the measures of the Cape Breton coal field afford a numerous veriety of fossil impressions, but since Mr. Brown wrote his classical work on the coalfields of Cape Breton, we are not aware that any extensive collection or classification has been attempted. This is, of course, entirely apart from the routine work of the Geological Survey. Dr. Ami deplores the fact that there is no museum in Cape Breton, and from the way he is amassing specimens there may presently be need for one. The firm impressions to be found above the Emery Seam are perhaps not to be excelled in any coalfield, while the ripple marks, footprints and raindrops to be found in the finely laminated sandstones running through the cliffs along the seaboard from Point Aconi to Mira Bay, have often been referred to in standard works on paleontology.

Apropos of this matter it may be mentioned that the English Institution of Mining Engineers is attempting to solve the long-debated problem of the correlation of the thick coal of Staffordshire with the coal seams of Lancashire and Yorkshire on either side of the Pennines by means of fossil "mussel beds" which have been found in this region to be very persistent in their distribution. The members of the Institution have been requested to send in specimens of fossil shells with particulars of their exact origin, and definite results tending to the more exact correlation of the now disputed measures are confidently hoped for. There can be no doubt that extended investigations of this nature in Cape Breton coalfields would yield valuable results.

We rather think Dr. Ami will need a box car to convey his specimens to Ottawa.

Glace Bay, August 1st, 1907.

It is reported on excellent authority, but as yet unofficially, that Mr. Hiram Donkin, at present the Chief Engineer of the Dominion Coal Company, has been appointed Deputy Commissioner of Public Works and Mines in Nova Scotia. It is understood that Mr. Donkin's duties will also include the supervision of roads and railways in the Province.

Mr. Donkin's connection with the Dominion Coal Company dates from 1893. From 1896 to 1901 he was the Resident Manager, and resigned his position when the Steel Company assumed the properties of the Coal Company under the lease which was afterwards cancelled. Mr. Donkin has held his present position since 1904.

The appointment has given much satisfaction in Cape Breton, where Mr. Donkin is deservedly popular, and it is generally conceded that he is a most suitable person for the post. His previous experience particularly fits him for the work of the Deputy Commissioner of Mines, and his sterling integrity ensures the careful safeguarding of the mineral interests of the Province, while his technical attainments are undoubted.

Mr. Donkin has given a good deal of his time to the advancement of the cause of technical education in Nova Scotia, particularly in the mining districts, and his labors in this direction were recognized when he was made a Master of Engineering of King's College. The status of technical education throughout Nova Scotia is such that the appointment of Mr. Donkin to this position will meet with the hearty approval of all the friends of this woefully neglected, but most important matter.

Altogether the appointment is regarded down here as a most happy one, and we congratulate the powers that be on their choice.

We understand that Mr. Donkin will commence his duties in Halifax on the 15th of August.

Glace Bay, 2nd August, 1907.

Work at the mines around Glace Bay has gone on without any serious interruption during the month of July, but the output is not by any means so large as required. This is altogether due to men staying off work, as there is really no scarcity of labor around the mines. The only trouble is the number of holidays taken by the men during the summer weather, and after pay day. The organization and equipment of the Dominion Coal Company's mines could easily have raised 360,000 tons for the month of July, but as a matter of fact they only hoisted 312,000 tons.

Work at the Hub Mine has gone on rapidly, and the management expect to raise coal by the end of this month. The water has been lowered to within 300 feet of the first level of the submarine workings, and as the volume of water is now much less it is being lowered more quickly. The head frame and bankhead is complete and the machinery is all in place. The pulleys will be hoisted this week.

The Drager life saving equipment has now all arrived, and the work of erecting the Rescue Station is being pushed. The equipment comprises ten helmet and ten mouth breathing apparatus, pneumatic smoke goggles, nose clips, oxygen refill pump, over two thousand potash cartridges, testing apparatus for CO_2, and about 1,500 feet of oxygen. The Company are arranging for the services of a competent instructor from the other side, and their Rescue Corps will presently be an accomplished fact. This innovation will cost the Coal Company between $5,000 and $6,000 for initial outlay, and the expenses of training and providing refills will not be inconsiderable. They will have the best Rescue Station outside of Germany, and although we fervently hope the occasion for its practical use will not arise, if ever it should the apparatus will prove of inestimable benefit, and will more than justify the expenditure. The citizens of Glace Bay will be able to boast that they have the only properly equipped Rescue Station on this side of the Atlantic. They do claim at present on picture postcards, that are printed, by the way, in Italy, that No. 2 is the "largest coal colliery" in the world.

This latest addition to the Coal Company's equipment is in line with their general policy during the past five years, a policy that is making their mines safer for the workmen every day. The abolition of the use of black powder, the introduction of "company shotfirers," in place of the pernicious system that formerly prevailed, the provision of the Ackroyd & Best electric relighting safety lamp, the attempts to introduce a safety explosive wherever possible, are a few of the things that might be named in this connection. None of these innovations but add to the general cost of mining, yet we venture to say the Company's policy is in line with all that is progressive in coal mining, and is justified and more than justified on the grounds of conservation of property and human life.

"Coal v. Steel" is about the sole topic of conversation in this neighborhood. Perhaps the only people who will benefit from the legal fraternity and the "fourth estate." Public opinion on the matter varies as the locality. Glace Bay is for Coal and Sydney for Steel. Perhaps never before has there been such an infliction of expert opinion on the newspaper readers of Cape Breton, and the old chestnut as to the three grades of liars is being trotted out afresh at every opportunity. No doubt by the time the Courts have decided the question the Caledonia workings will be drawing air from No. 6 Mine, and the surveyors will be wondering whether they have left sufficient coal in their barriers against No. 6 workings. All other matters in connection with this trial are sub judice and are better left alone—but No. 6 Mine not on the Phalen Seam? Ask a man from Schooner Pond and watch him smile! They have very fixed ideas at Schooner Pond.

QUEBEC.

Mr. A. O. Norton, Coaticook, Que., is preparing to develop the Suffield Mine at Suffield, Que., of which he is the proprietor, on a larger scale than has been hitherto done. Machinery to the value of $20,000, including a new boiler, air compressor, and hoisting plant, has been purchased and is now being installed.

The Suffield is one of the numerous copper properties that were opened in the vicinity of Sherbrooke over forty years ago and that were subsequently closed during the long interval of low priced copper. It has long been known to contain a large body of ore generally estimated at 3 p.c. copper. But during the past year Mr. Norton has developed a large amount of ore of a higher grade said to average nearly 7 p.c.

No smelting facilities have as yet been provided. The mining work is under the direction of Capt. Wm. Jenkins.

ONTARIO.

Montreal River, July 22nd.—It was in the middle of last winter that the rush into the new Montreal River silver district began. From January on, the prospectors tramped up the Montreal River on snowshoes from Latchford, and overland from New Liskeard, to stake claims. Most of the claims in the district are "snowshoe staked," the object in most cases being to stake and record a claim and then sell it at a moderate price to some man with capital, who would prospect it in the spring. This involves, in ninety-nine out of one hundred instance, perjury in recording the claim, when one has to swear to the discovery of valuable mineral in place; but perhaps the law is defective on this point and there may be some excuse for the false oath under the circumstances. This seems to be the attitude of the government, as no action for perjury has been instituted even in the most evident and indisputable cases.

The district is swarming with prospectors at present, and on claims where valuable discoveries have been made, and in the vicinity of these claims, considerable stripping and blasting is being done.

Silver has been found, so far, in two places, at White's, about 7 miles north-west of Lady Evelyn Lake; and in the township of James and the adjoining township of Smyth, about 25 miles north of the former. At White's, which Prof. W. G. Miller visited last spring, the vein shows at one place a width of about three inches of native silver. There is an equally good, or perhaps, a better showing on Downey and Darragh's claim in James. In Smyth there are several veins showing an inch or so of native silver. In some of these veins in Smyth, the silver is in a crystallized form, having a beautiful arborescent or branching structure. The usual occurrence, so far as noted, is in nuggets, in wires forming a sort of filigree effect, or in flakes scattered through the gangue. The gangue minerals are calcite, quartz and barite. In some veins calcite and quartz occur together. In one place there has been found quartz with cavities from which have been weathered out crystals of calcite.

The veins in the Montreal River district, so far as they have been explored up to the present, show a marked difference from most of those found in Cobalt. The Cobalt veins have some degree of uniformity in their width and in their silver values, whereas the veins in the new district are extremely erratic in these respects. A light crack will develop into a vein of considerable width in a short distance, and a vein which in one place carries no silver, or almost none, will a few feet off be what is ordinarily called "solid silver." Keeping these facts in view, it will be seen that the value of the veins is extremely problematical. If the pockets containing silver are large enough and frequent enough, the properties will no doubt prove very valuable. There has not been enough development work done so far to determine anything as to this point.

The predominating rocks in the new silver area, so far as examined, are the Lower Huronian quartzite, and diabase. There is also Laurentian granite and a little Keewatin. The granite areas are, of course, rough. The quartzite areas are

level, the few hills in them being usually diabase. These hills seem to be the remainder of a huge sheet of diabase which at one time covered the country. Dykes of diabase are also common. It is in the diabase that all the silver has been found. There are limited areas of conglomerate, also, but unlike the conglomerate of the Cobalt district, no mineral has been discovered in it yet.

Last spring the government created the Montreal River special inspection district, which includes the new silver area. In this field, as at Cobalt, every claim must be examined and passed by an inspector before a patent for the mining rights is granted. This is meant to prevent the blanketing of claims (which occurred at first in Cobalt) and seems to work in a satisfactory way. There are now eight inspectors at work in the district. This system tends to hasten the development of the country, since the owners, or rather those who hope to be owners, of claims on which there has not been enough discovered to pass inspection, work hard to find something before the inspector comes round. The inspectors in their decisions give the real prospector, the man who wants to work, every possible chance.

There is now a line of boats, steam and gasoline, running from Latchford to Bear Creek in James Township, 40 miles up the Montreal River. At Bear Creek a post office has recently beea established—Elk Lake P. O.—and there are stores and restaurants there and at other points along the line. There is quite a settlement already at Bear Creek, and it looks as if it were going to be the future town of the district.

ALBERTA.

COLEMAN, ALTA.

At Frank, Alberta, the zinc smelter of the Canadian Metal Company lies idle. The plant is extensive, entirely up-to-date, and represents an enormous investment. It is the only smelter of its kind in Canada and has a capacity sufficient to supply the home market. No sooner was it in working order than the American Government placed a tax of 1½ cents a pound on spelter, thus shutting off the market of the Western States to the Canadian enterprise. At the same time the American producers retain the Canadian market, which is mostly in the Eastern Provinces, since they have no duty to pay on spelter coming into Canada and have the advantage of ½ cent a pound in freight over their far-western competitor. As a result, zinc ore, which must be taken out with the lead in the British Columbia mines, is thrown on the dump. This is regrettable because the capital invested in lead mining might have an additional return from zinc and because the capital invested in the Frank Smelter has no return at all. Moreover the profitable production of spelter has proven to be more hazardous than the smelting of most other ores, and the initial attempt at Frank, so far removed from any similar plant, thus compelling the managers to educate their experts from recruits, called for all the safeguards Canada could lend to it. The sensible solution would be to tax spelter. If the Dominion Government wished further to encourage the industry, they might bonus spelter for a few years, as they do steel. The miner needs no bonus for extracting an ore which he mines now for nothing, since he would be benefitted sufficiently by having a market for his ore. Here is work for the Alberta, British Columbia and Dominion Governments. Meanwhile the Canadian consumer is paying to the American Trust $5.90 for zinc that is quoted in London at $5.18, because the Americans can uphold the price while they have the market on which to dump their surplus product.

Car Shortage.—Many of the Coal Mines along the Crow's Nest Railway are suffering for want of cars. They either have no place to store coal or cannot afford to handle it a second time. The companies that also make coke are further handicapped by not being able to get out enough slack for their ovens since they have no place for the screened coal. This again threatens the smelters up the line that are waiting for coke. Apart from this the operators, who install costly plants, calculate on working their full capacity, depending on daily profits to offset the wear and tear of machinery, mine repairs and wages of a permanent office and engineer force, not to mention a return on their investment. In these days, too, miners are scarce and operators cannot hold their men when steady work attracts them elsewhere. Thus one operator gains prestige in the market at the expense of a less fortunate competitor. Last, but not least, the miners lose "shifts," which are needed for bread and butter.

Strathcona, Alberta.—At Strathcona, Alberta, the Clark Dredging Co., of Chicago, manufacturers of the Clark Hydraulic Dredge, are installing a plant for the Northern Dredging Co. The latter has a concession from the Dominion Government for fifteen miles of territory along the Saskatchewan River. The ground was tested last fall for gold and platinum. The Clark Dredge is a combination between the bucket and suction dredges. It digs the gravel and the suction elevates it. The plant will be in operation in two weeks.

GENERAL MINING NEWS

NOVA SCOTIA.

Sydney.—The transfer of the Port Morien coal areas to the North Atlantic Collieries Company has been completed. The erection of houses will be started. The Government dredge is deepening the harbor.

The action of James T. Burchell against the Dominion Coal Company is reported to have been settled out of court. The amount involved was $116,200, and the litigation arose over certain coal areas at Point Aconi.

Mr. F. W. Harbard, the English authority on the metallurgy of steel, is one of the witnesses called by the Dominion Iron and Steel Company in its suit against the Dominion Coal Company.

At Catalone near Lonisburg, C.B., an asbestos mine is being opened. American capital is in control.

Londonderry.—It is reported that the Londonderry Iron and Mining Company is to erect a car-wheel foundry on its property at Londonderry. Here they will use the pig-iron from their own blast furnace and will supply car-wheels to the Silliker Car Works, a new concern being started in Halifax.

Chignecto.—On August 1st the Maritime Coal Railway and Power Company put in operation their Chignecto power plant, the only plant on the American continent where power is generated at the pit-mouth for distribution. The machinery includes a 800 h.p. Robb-Armstrong engine, and an alternating geneator of 100 kilowatt capacity, manufactured by the Canadian Westinghouse. During the opening ceremonies, a telegram of congratulation was received from Thomas Edison, whose father, by the way, lived for some time in Nova Scotia.

Springhill, July 31.—Thirteen hundred employees of the Cumberland Coal and Railway Company quit work this evening. The men resented deeply the finding of the Conciliation Board, appointed under the provisions of the Lemieux Act. as regards "local stone." The Board, compoes of Jus-

tice Patterson, chairman, P. S. Archibald, representative of the Company, and R. B. Murray, representative of the men, is continuing its sessions.

ONTARIO.

Cobalt.—The Coniagas is the leading shipper for the first six months of 1907. 1,448 tons is its record for that period. The shipments from the Nipissing were 1,269 tons and the O'Brien 1,144 tons. For the three months ending June 30th, the O'Brien paid $145,000 as royalty to the Government. The royalty is set at 25 p.c. of the value of the ore at the shaft head.

The Rand-Jenckes Company on August 1st had eight cars of machinery under order and waiting to be unloaded at Cobalt station. To the Nipissing, two 125 h.p. boilers were consigned; Nova Scotia, the same; Rochester, the first half of a 12 drill compressor. The Big Ben mine in Bucke has an order for the first half of a 12-drill compressor, 80 horse-power boiler, drills and hoist.

The Western Federation is attempting to organize the T. & N. O. employees, with the avowed object of suspending traffic by declaring a strike. It is high time that the Government intervened.

Alexander McIsaac, a native of Dartmouth, N.S., slipped and fell down the shaft of the Temiscaming and Hudson Bay Mine on August 3rd. Death was instantaneous.

It is estimated that on the Tretheway dump alone, over $175,000 of low grade ore is available for concentration.

Kenora.—The Bully Boy gold mine is to be re-opened. The shaft is now down 215 feet. About 200 feet of drifting has been done.

Port Arthur.—The Atikokan Iron Company's blast furnace was blown in on July 1 th. The promoters of this new venture are Messrs. MacKenzie and Mann associated with whom are certain Duluth and Chicago gentlemen. The Company controls the Atikokan Iron Mines, 100 miles west of Port Arthur on the Canadian Northern Railway. In addition to the furnace and coke ovens a large roaster has been erected, and put in operation. The ore is a magnetite carrying over 1 per cent. of sulphur. Besides eliminating the sulphur the roasting renders the ore much more amenable to further treatment. The ore is transported to the plant in 35-ton cars. It is dumped into pockets and hoisted to the top of the roaster. The fuel in roasting is the waste gas from the furnace. The blast-furnace has a capacity of 100-tons of pig iron per day. Coke is supplied by 100 beehive coke ovens. The capital expenditure involved in the erection of this plant reached the sum of $1,300,000. Three quarters of a mile of elevated track and three miles of other track have been laid around the plant. The major part of the pig-iron output has already been contracted for by the Canada Foundry Company.

The old Beaver silver mine will be unwatered as soon as possible. Machinery is being sent by rail to Silver Creek, thence by road to the mine. The Beaver was closed 16 years ago. There are buildings on the property.

BRITISH COLUMBIA.

Fernie.—An upheaval of the floor and an outbreak of gas in Room No. 11, No. 2 Mine, Coal Creek, one of the Crow's Nest Pass Mines, resulted in the death of an employee, Robert Bell.

W. C. Thomas, manager of the Dominion Copper Co., has had plans drawn for a two stand converter plant for the smelter. At present the matte from Boundary Falls is being blown to blister copper by the converters of the B. C. Copper Co.

Ten stamps are now dropping steadily at the Cariboo-McKinney. In all likelihood ten stamps more will be put into commission in the near future.

The Diamond-Texas shaft is down 150 feet in quartzite.

At the Strathmore Mine, Greenwood, the shaft has been sunk to 150 feet. A 10-horse power electric hoisr forms part of the equipment.

The Consolidated Mining and Smelting Company of Canada, Ltd., has secured control of the properties of the Phoenix Amalgamated Copper Mines, Ltd., by purchase and has also secured options on a number of other mineral claims near Phoenix. The Phoenix Amalgamated group consists of eleven claims, chief of which are those of the old War Eagle, operated seven years ago by the War Eagle Copper-Gold Mining Company. These claims adjoin the Granby group in the south. A 20-drill air compressor is to be installed on the War Eagle at once and men and supplies are being hurried to the mine.

The Granby Consolidated Company is contemplating increasing its smelter capacity from 3,000 to 4,000 tons per day.

Slocan.—The Hewitt mine, near Silverton, Slocan Lake, has been sold to New York parties. The price is reported to be about $200,000. Discovered in 1892, the Hewitt was worked during 1900-1903. Since January 1904 it has shipped 1,000 tons of ore.

The drift on the 200-foot level of the Krao has been continued and the size of the ore body is reported constant.

The Payne, it is reported, has been reorganized with a capital of $500,000.

Phoenix.—All three of the B. C. Copper Co's. large furnaces are in operation. An ore tonnage of nearly 2,000 tons daily is being smelted. This implies a monthly copper production of nearly 1,500,000 pounds.

Boundary.—Both the B. C. Copper Company and the Dominion Copper Company have made contracts with the Intercolonial Coal and Coke Company for Coke supplies for their smelters.

The large crusher for the Granby's Gold Drop mine was shipped from Sherbrooke, Que., on August 1st. Ground has been broken for installation of the crusher and ore bins.

Alberta.—The International Coal & Coke Company has closed a contract with the C. P. R. for its entire coal output. A daily output of about 2,500 wi,l soon be reached.

There are one hundred and thirty coal mines in Alberta. Seventy of these are producers, their output ranging from 5 to 500 tons per day. Nearly every mine in Southern Alberta is working a eight-hour day, many of them "bank to bank." The large Thorinville mine, in northern Alberta, although not a union mine, works an eight-hour day.

GREAT BRITAIN.

The first meeting of the Governing Body of the Imperial College of Science and Technology, was held in London in July. Lord Crewe was unanimously elected Chairman, and on taking the chair was handed by the President of the Board of Education, the Rt. Hon. R. McKenna, the Letters Patent containing the Grant of the Charter of the Imperial College.

In the House of Commons the other day the Home Secretary, Mr. Gladstone, said that he had come to the conclusion that there should be a distinct mines branch in the Home Office. It appeared to him that this was necessary, but the question was so intimately concerned with the organ-

ization and strength of the mines inspectorate throughout the country that he thought best to wait for the deliberate opinion of the Commission before anything was done.

In the recently issued report under the Explosives Act it appears that the number of accidents by fire or explosion in British coal mines last year was 379, which is considerably above the average of the last ten years. The greatest number of accidents were due to sparks, flame, etc., while next in order were accidents from ramming or stemming the the charge, and striking unexploded charges in the removal of debris.

YUKON.

The Yukon Smelting and Power Company are planning the erection of a smelter and electrical power plant at White Horse. As the haul to the railway is now $4 per ton and railway and steamer freightage and smelter charges $7 per ton, when copper ore is sent to the Coast smelters, the new concern will keep a great deal of money in the district. The Puebla and Arctic Chief mines have many thousand tons of ore in sight. The Grafter and Arctic Chief are producing about 50 tons of ore per day.

FRANCE.

It is estimated that the new 8-hour law applicable to coal mines will cause a considerable reduction in the production of coal, and necessitate the provision of 16,000 additional miners to make up for this deficiency in the output.

SPAIN.

General interest has been aroused by the report of the existence of large deposits of iron and copper ore in Galicia, to which representatives from various syndicates both British and of other nationalities are now flocking.

INDIA.

The coal production of India (chiefly Bengal) for the year 1906 is estimated in the Administration Report on the Railways in India to have been 9,261,714 tons, or an increase of about 800,000 tons over the output for 1905. Of this, the Indian railways consumed 2,878,281 tons.

SOUTH AFRICA.

The gold production for May was 524,477 oz. valued at £2,227,838. The average value per ton milled was as follows: Rand, 33.68s.; Outside, 36.10s.; Transvaal, 33.76s.

Recent cablegrams state that there is at present a want of cohesion among the strikers, and other signs indicate that the strikers are anxious to terminate the struggle. There have been one or two outrages of late including the dynamiting of a house in Johannesburg, by which three persons were killed and several injured.

The Government of the Transvaal proposes to introduce legislation in line with the New Zealand Compulsory Arbitration Act, and commenting thereon the London Mining Journal remarks that in the light of the experience of the last two or three years such an addition to the statute law of the Transvaal can hardly be regarded as a measure of progress; and adds: "The institution of these obligatory courts of arbitration have not been able to prevent workmen from striking or compel them to return to work after an award has been given." At least recent attempts in Canada in the direction of Government interference in labor differences have not been attended with notable success.

UNITED STATES.

The output of pig-iron for the first half of the current year is estimated at 13,500,000.

The coal fields at Batan in the Phillipines are described in a report recently issued by the Mining Bureau. Both lignites and bituminous coals have been mined and are of good steaming quality. It is estimated that in one square mile investigated there are 15,360,000 tons of workable coal.

The American Census Bureau at Washington has issued a final report on the iron and steel industry of the United States, from which the following figures are taken: In 1890, the number of establishments was 719; in 1905 this had decreased to 606, but the capital invested had increased from $414,014,844 to $948,689,840; the salaries paid had more than trebled, the number of wage earners doubled, while production increased from 16,264,478 tons in 1890 to 34,844,933 tons in 1905.

A correspondent of "The Mining World" (Chicago) gives an interesting account of a trial run of a Heroult electric smelter on iron ores in California, which he pronounced a great success. It is thought that the Shasta county magnetite can be converted into pig iron of the best grade and sold in San Francisco at $16 a ton. The present price of pig iron is that market is $31 a ton, being chiefly imported from Europe. At Heroult where the experiments were conducted there is an extensive iron region and the ores can be mined and carried to the smelter at a very low cost.

Messrs. Allan, Whyte & Co. also made some little time ago three lengths for the Jupiter Gold Mining Co., Ltd., South Africa, on same principle and which weighed fully 6½ tons each.

Messrs. Allan, Whyte & Co., Clyde Patent Wire Rope Works, Rutherglen, Glasgow, have just completed the manufacture of three large Winding Ropes for the East Rand Proprietary Mines, Ltd., South Africa.

The Ropes, which in the aggregate measure 15,000 feet and weigh 20 tons, are made on the taper principle to meet the problem of winding heavy loads from great depths. They were inspected during manufacture by Mr. N. Wilson, Consulting Mechanical Engineer for the Group, who is at present in this country.

STATISTICS AND RETURNS

Shipments from the Cumberland Coal and Railway Company Springhill Collieries for the month of July were 37,057 tons.

Cobalt ore statement, period ending July 20th:—

July 16th, Coniagas Mine, American Smelting and Refining Co., Perth Amboy, N.J., 40,000 lbs.

July 16th, Coniagas Mine, American Smelting and Refining Co., Perth Amboy, N.J., 66,090 lbs.

July 18th, Coniagas Mine, Oxford Copper Co., Coppercliffe, Ont., 63,090 lbs.

July 19th, Coniagas Mine, American Smelting and Refining Co., Perth Amboy, N.J., 42,000 lbs.

July 19th, Coniagas Mine, American Smelting and Refining Co., Perth Amboy, N.J., 64,000 lbs.

July 18th, Silver Queen, Canada Copper Co., Coppercliffe, Ont., 87,000 lbs.

July 18th, Hudson Bay Mine, Canada Copper Co., Coppercliffe, Ont., 45,170 lbs.

July 18th, Silver Leaf, Canada Copper Co., Coppercliffe, Ont., 43,518 lbs.

July 19th, Nipissing Mine, Nipissing Mining Co., New York, N.Y., 63,550 lbs.

Grand Total—514,418 lbs.

Cobalt ore statement, period July 22 to July 27, 1907 :—

July 23rd, Coniagas Mine, American Smelting and Refining Co., Perth Amboy, N.J., 42,000 lbs.

July 23rd, Coniagas Mine, American Smelting and Refining Co., Perth Amboy, N.J., 64,000 lbs.

July 25th, Coniagas Mine, American Smelting and Refining Co., Perth Amboy, N.J., 62,000 lbs.

July 27th, Coniagas Mine, American Smelting and Refining Co., Perth Amboy, N.J., 64,000 lbs.

July 27th, Coniagas Mine, American Smelting and Refining Co., Perth Amboy, N.J., 80,000 lbs.

July 25th, Buffalo Mine, Chas. L. Dennison, New York, 60,000 lbs.

July 25th, LaRose Mine, American Smelting and Refining Co., Perth Amboy, N.J., 40,000 lbs.

July 25th, LaRose Mine, American Smelting and Refining Co., Perth Amboy, N.J., 40,000 lbs.

July 26th, Trethewey Mine, American Smelting and Refining Co., Perth Amboy, N.J., 50,300 lbs.

July 26th, Nipissing Mine, Nipissing Mining Co., New York, N., 60,975 lbs.

Grand Total—563,275 lbs.

Cobalt ore statement period July 29 to Aug. 3, 1907 :—

July 20th, LaRose Mine, LaRose Mining Co., New York, N.Y., 63,155 lbs.

Aug. 1st, LaRose Mine, American Smelting and Refining Co., Perth Amboy, N.J., 42,250 lbs.

July 31st, Nipissing Mine, Nipissing Mining Co., New York, N.Y., 87,843 lbs.

Aug. 1st, Nipissing Mine, Nopissing Mining Co., New York, N.Y., 63,710 lbs.

Aug. 2nd, Nipissing Mine, Nipissing Mining Co., New York, N.Y., 43,165 lbs.

Aug. 2nd Nipissing Mine, Nipissing Mining Co., New York, N.Y., 45,990 lbs.

Aug. 3rd, Nipissing Mine, Nipissing Mining Co., New York, N.Y., 65,592 lbs.

Aug. 3rd, Nipissing Mine, Nipissing Mining Co., New York, N.Y., 41,100 lbs.

July 31st, Buffalo Mine, Canadian Copper Co., Coppercliffe, Ont., 40,000 lbs.

Aug. 3rd, Buffalo Mine, Chas. L. Dennison, New York, N.Y., 60,000 lbs.

Aug. 1st, Nova Scotia Mine, B. H. Stewdler, Perth Amboy, N.J., 66,000 lbs.

Aug. 1st, O'Brien Mine Canadian Copper Co., Coppercliffe, Ont., 61,000 lbs.

Grand Total—679,805 lbs.

L. Vogelstein & Co., New York, give the following figures of German consumption of foreign copper for the months of January to June, 1907 :—

Imports of copper	59,637 tons
Exports of copper	4,130 tons
Consumption	55,507

As against consumption during the same period in 1906 of 61,115 tons. Of this amount 45,776 tons were imported from the United States.

DOMINION COAL COMPANY.

Outputs and Shipments July, 1906 and 1907 :—

No. 1	45,266	44,160
No. 2	51,701	55,510
No. 3	34,876	34,210
No. 4	49,751	45,350
No. 5	55,603	54,050
No. 6	6,005	16,760
No. 7	11,381	23,400
No. 8	25,052	23,400
No. 9	33,961	30,300
No. 10	3,695	9,080
	318,291	312,820
Shipments	353,247	353,738

Cobalt's Total production :—

	Tons of Ore.	Value.
1904	$ 158	$ 136,217
1905	2,144	1,273,196
1906	5,129	3,900,000
1907 (6 mos.)	6,431	4,890,019
Total to date	13,862	10,000,000

Sydney Mines.—The total output of the four collieries of the Nova Scotia Coal & Steel Co. for the month of July amounted to over fifty-five thousand tons, the figures for the different collieries being as follows :

No. 1	22,393 tons
No. 2	24,564 tons
No. 3	7,760 tons
No. 4	500 tons

BRITISH COLUMBIA SHIPMENTS.

Rossland shipments for the week ending July 13th increased to 8,055 tons.

Shipments for the week were as follows : Centre Star, 5,010; Le Roi, 2,240 ; Le Roi No. 2, 595 ; White Bear, 210 ; total for week, 8,055, and for year to date, 146,147 tons.

At Trail smelter there was received during the week 5,781 tons, while the Le Roi smelter at Northport received 2,240 tons.

Shipments for the week ending July 20 :—

Shipments for week ending Aug. 3rd :—

	Week.	Year.
Boundary	30,537	675,234
Rossland	4,140	161,998
Slocan-Kootenay	3,025	76,746

The total shipments from the mines in the above districts for the past week were 44,472 tons, and for the year to date 828,898 tons.

METAL, ORE AND MINERAL MARKET.

Aluminium, No. 1 grade ingots—45 to 47 cents per lb.
Antimony—10 to 14 cents per lb.
Arsenic, white—7½ to 7¾ cents per lb.
Barytes, crude—$11.25 to $1.75 per lb.
Bismuth—$1.50 to $1.75 per lb.
Cadmium—$1.46 to $1.50 per lb.
Carbons for drills—$78 to $85 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, metal pure—80 cents per lb.
Cobalt, f.o.b. Cobalt, Ont., unrefined—35 to 50 cents per lb.
Corundum—7 to 9½ cents per lb.
Feldspar, ground—$12 per short ton.
Flourspar, lump—$10 per short ton.
Graphite, domestic—$50 to $150 per short ton.
Gypsum, lump—$4.50 per long ton.
Infusorial earth, ground—$25 to $30 per ton.
Lead—5.25 cents per lb.
Manganese, pure metal—75 cents per lb.
Mica, ground—$80 per short ton.
Mica, scrap—$15 per short ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 95 per cent. pure—$4.50 to $5 per unit.
Nickel—45 to 50 cents per lb.
Platinum, ordinary metal—$26 per ounce.
Platinum, scrap—$20 to $21 per ounce.
Pyrite, 38 per cent. to 45 per cent. sulphur, lump, 10¼ to 11½ cents per unit.

MARKET NOTES.

Spelter.—Market is still declining. New York 5.85 cents per lb. ; London £23 2s.

Lead.—New York steady at 5.25 cents per lb. ; London, £19 10s. for Spanish lead.

Tin.—Market is flat. New York, 40 cents per lb. ; Kondon, £182 for spot.

Copper.—Market stagnant ; New York, Lake 21½ cents per lb. ; electrolytic, 20½ cents per lb. ; London, spot for standard, £86.

Silver, per ounce.—July 18, 68⅓ cents ; July 19, 68¼ ; July 20, 68⅝ ; July 22, 69⅛ ; July 23, 68⅞ ; July 24, 68⅞ ; July 25, 68¾ ; July 26, 69 ; July 27, 69⅛ ; July 29, 69⅜ ; July 30, 69⅜ ; July 31, 69½.

Pig Iron.—Pittsburg, Bessimer pig, $22.50 ; No. 2, Foundry, $23.50.

Iron Ore.—Bessemer Old Range, $5.00 ; Bessemer Mesali, $4.75 ; Non-Bessemer Old Range, $4.25 ; Silicious non-Bessemer, $2.50.

WANTED

Mining Graduate (McGill) desires a position in Cobalt or vicinity as Superintendent or Foreman with reliable Mining Company. The applicant has had several years in Montana in the practical work of Mining and Concentrating. At present he is Superintendent of a Mining Company.

Address :—"Montana,"
c/o Canadian Mining Journal.

MINING PROPERTIES WANTED.

Prospectors and others wishing to dispose of Mining Claims or undeveloped Mines in Ontario or Quebec, can communicate full particulars to the address below.

The properties will be examined by competent mining engineers, and if satisfactory, arrangements will be made to buy the same.

Address, General Post Office, Box 481,
Toronto, Canada.

I WILL GRUBSTAKE

PROSPECTOR and develop the find, if showing warrants. Don't waste your time writing me about ordinary opportunities ; I'm deluged with such.

J. B. SPERRY, 18 BROADWAY, NEW YORK.

IRON AND PYRITES CLAIMS FOR SALE

Several undeveloped iron claims and several partially developed pyrites claims, within one mile of line of Canadian Northern Railway, 50 miles west of Fort William ; and an undeveloped copper and silver claim near Nipigon, for sale.

Particulars P.O. Box 512, Fort William, Ont.

WANTED AT ONCE.

Young mining graduate with some practical experience to do some work in the province of Ontario. Apply at once to

Fritz Cirkel, M.E., 80 Stanley St., Montreal

MINES AND STOCK FOR SALE

Four Copper Mines assaying high in silver and gold. Nickel Mine running about $68.00 to the ton in silver and situated twelve miles from Sturgeon Falls. Assays and mines can be seen at any time. Also a few thousand shares of Nipissing Copper and Silver Co., Limited. Apply to

R. Niffin, Smoky Falls, Ont.

MINING MACHINERY FOR SALE

Splendid opportunity to secure some good machinery far below the price of new and all or any part of it can be delivered on the cars in one week.

One Class D Rand Cross Compound Condensing Duplex Air Compressor having a capacity of 835 feet of free air and will run 10 No. 2 Rand Drills. High pressure steam 14 x 24, low 22 x 24, air cylinders each 14 x 22. Has Myers' patent steam cut off valves and machanically operated air valves. Machine good as new.

One double cylinder, 10 x 16, Lidgerword Hoisting Engine. Drum, 54-inch diameter and holds about 700 feet of wire rope without overlapping. End friction and friction hand break. This machine is as perfect as the day it left the shop.

Lots of Steam Pipe ranging from 2 to 5 inches.
Light Steel Pit Rails about 14 pounds.
Steel Piping Tools from 2 to 5 inches.
One Heavy Duty Steam Mining Pump.
One Northy Duplex Steam Boiler Feed Pump.
Rand No. 2 Rock Drills and Barrs.
Rock Drill Steel ready for machines and in good lengths.
One 15 H. P. Steam Engine.
One 25 H. P. Steam Engine.

These engines would be just the ones for a saw mill or could be used as a pumping engine for a mine. Steel Ore Car Bodies just the thing for underground work. This lot of odds and ends will be sold low for cash.

For particulars address, G. M. this paper.

ROOF for the Years to Come

Just one roof is GUARANTEED in writing to be good for 25 years and is really good for a hundred. That's a roof of

"OSHAWA" GALVANIZED STEEL SHINGLES

Put them on yourself—common sense and a hammer and snips does it. The building they cover is proof against lightning, fire, wind, rain and snow. They cost less because they're made better, and of better material. Write us and learn about ROOFING RIGHT. Address 205

The PEDLAR People (Est'd 1861).

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

SAULT STE. MARIE, CANADA

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

CANADIAN MINING INSTITUTE

Incorporated by Act of Parliament, 1898.

Aims and Objects.

(A) To promote the Arts and Sciences connected with the economical production of valuable minerals and metals by means of meetings for the reading and discussion of technical papers, and the subsequent distribution of such information as may be gained through the medium of publications.

(B) The establishment of a central reference library and a headquarters for the purpose of this organization.

(C) To take concerted action upon such matters as affect the mining and metallurgical industries of the Dominion of Canada.

(D) To encourage and promote these industries by all lawful and honorable means.

Membership.

Members shall be persons engaged in the direction and operation of mines and metallurgical works, mining engineers, geologists, metallurgists, or chemists, and such other persons as the Council may see fit to elect.

Student Members shall include persons who are qualifying themselves for the profession of mining or metallurgical engineering, students in pure and applied science in any technical school in the Dominion, and such other persons, up to the age of 25 years, who shall be engaged as apprentices or assistants in mining, metallurgical or geological work, or who may desire to participate in the benefits of the meetings, library and publications of the Institute. Student members shall be eligible for election as Members after the age of 25 years.

Subscription.

Members' yearly subscription $10.00
Student Member's subscription 2.00

Publications.

Vol. I., 1898, 66 pp., out of print.
Vol. II., 1899, 285 pp., bound red cloth.
Vol. III., 1900, 270 pp., bound red cloth.
Vol. IV., 1901, 333 pp., bound.
Vol. V., 1902, 700 pp., bound.
Vol. VI., 1903, 520 pp., bound.
Vol. VII., 530 pp., bound.

Membership in the Canadian Mining Institute is open to everyone interested in promoting the profession and industry of mining without qualification or restriction.

Forms of application for membership, and copies of the Journal of the Institute, etc., may be obtained upon application to

H. MORTIMER LAMB, Secretary, Montreal.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers kindly mention this Journal.

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

UNDERWOOD

¶At the Canadian National Exhibition we will have the best exhibit of typewriters ever shown in Canada. It will be of unusual interest of business men who wish to have their office equipment a little ahead of the times.

¶The special feature of the exhibit will be the Condensed Biller, a machine which is indispensible in a business with a large number of accounts; the Retail Bill and Charge machine and the Unit Biller.

¶Be sure to come and see us, and have our demonstrators put you in touch with these great systematizers of office work. They are economizers—of time, labor, money.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8 50. Special to readers of this paper **$5.00**

1 000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper ..... **.90**

500 Working Jackets, of striped moleskin and duck in khaki, brown and slate. Regularly $2.00 apiece. Special to readers of this paper **$1.25**

Underwear, Shirts, etc.

Men's Heavy Scotch Wool and Fleece Lined Underwear, guaranteed unshrinkable, non-irritating, overlocked seams, elastic ribbed cuffs and ankles. Sizes 34 to 46. Regular value, 90c. garment, per garment..... **.69**

500 Men's Heavy Khaki Duck Mining Shirts, collars, pockets, have patent fasteners, large roomy shirts, wind and rain proof. Sizes, 14 to 17½. Special ..... **.89**

Men's English Cardigan Jackets and Golf Coats, three pockets, guaranteed all worsted, fast color. Sizes, small, medium and large. Regular value $4.00 and $5.00. Each **$2.98**

Men's Heavy Elastic Web Suspenders, strongly sewn, made with unbreakable cast off leather ends, Police-Firemen style. Our price 50c. Each ..... **.39**

Men's Heavy Tweed Shirts with collar and pocket, generously made, double stitched throughout, also a few heavy Mackinaws and black Drills in the lot. Sizes 14 to 18. Regular value, $1.25, $1.50, $1.75, $2 00. Each.. **.89**

COAL MINING MACHINES

Sullivan Air-Driven Pick Machine at Work.

SULLIVAN PICK MACHINES

increase the production of coal per miner, reduce the cost per ton, and secure more lump and less slack than when mining by hand.

They reduce the area to be drained, ventilated and supported, and diminish the danger of blown out shots, since but little powder is needed for blasting.

The positive value motion employed in these machines secures a slow, powerful blow, economy of air, and ease of operation, rendering the Sullivan the most *rapid and efficient Pick Machine in use.*

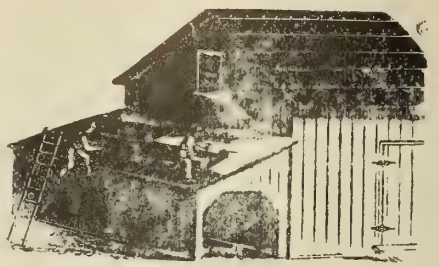
Amatite ROOFING

THE MINERAL SURFACED ROOFING

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expenses of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.

The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.



Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

Twenty-First Year. Established in 1887

The Mining Manual

For 1907

By WALTER R. SKINNER

Contains all the latest information up to within a few days of publication. The Standard Reference Work on Mines. 1,600 pages. In demy 8vo, cloth. Price 21/-, post free.

A Record of Information concerning Mining Companies (Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, and Exploration Concerns, etc.)

Arranged in Three Sections, **Australasian, African, Miscellaneous,** with Tables of Crushings at ends of Sections, followed by List of Mining **Directors and Secretaries,** their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected; also **Mining and Consulting Engineers and Mine Managers,** with their Company connections, and a **Dictionary of Mining Terms.**

THE MINING MANUAL FOR 1907 contains particulars of no less than 3,100 COMPANIES, arranged in three sections, 450 Companies being AUSTRALASIAN; 1,050 AFRICAN; and 1,600 MISCELLANEOUS (including Siberian, Mexican, Indian, Canadian, American, etc., and the Coal, Iron, and other mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; position at mine and ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts.

The Lists of Directors (over 7,000) and Secretaries (1,750) include their addresses and descriptions and names of the Companies with which each particular Director or Secretary is connected.

A complete Alphabetical Index, including many useful items of reference, occupies 40 pages.

Leading Features of a Good Rock Drill

No. 3.—Patented Adjustable Shell

The Patented Adjustable Shell of the "RAND" Drill is a valuable feature, and is the only practical adjustable shell on the market. By removing one or more of the thin sheet-iron shims and tightening the slide bolts again both top and side wear is taken up The shims are held by dowels, so that they cannot wear out. On the smaller drills the shells are made of malleable iron, but on the large drills where the shells are subject to greater strains they are made of the highest grade of open-hearth steel castings.

This arrangement of guides assures the maximum of bearing surface whatever the position of the drill. Adjustment is secured by taking-out liners, therefore no extra stock is needed.

Great Turnstile, London, England

McGill University

MONTREAL

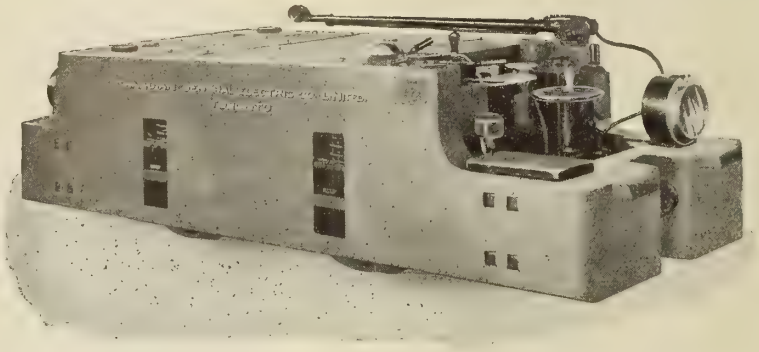
The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.



Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

FOLLY

The Canadian public is now being edified by the spectacle of two large corporations fighting out a quarrel in court. Until very recently it was hoped that the Dominion Iron & Steel Company's offer to settle the squabble out of court would have been accepted by its powerful antagonist. But the proffered good offices of would-be mediators were rejected and litigation was resorted to.

It is patent to all those who have followed the history of the Dominion Iron & Steel Company, that it is unable to stand the enormous expenditure entailed by such a suit. Nothing but sheer desperation could have justified its Executive in seeking the arbitrament of the law. An adverse decision will assuredly cripple it for many years to come.

With the Dominion Coal Company the case is different. It is a rich and successful corporation. It can survive total defeat, but not without feeling it severely.

These considerations, however, have nothing to do with the equity of the case.

Some months ago, or even at the initial stage of the disagreement, it should have been, in all reason, quite possible to have arrived at a compromise satisfactory to both of the contending parties. But apparently the actual outbreak of hostilities was preluded by a series of petty personal encounters. In the preliminary interchange of ultimata, decorum and moderation were forgotten and the difference at once became dangerously akin to a personal quarrel. The subsequent course of events has not weakened this impression.

Here, then, we see two of Nova Scotia's most important industries, each the natural ally of the other, engaged in a costly and dangerous struggle, because two or more of the chief officers of each could not sacrifice their personal pride.

We have freely condemned the labour organizations when they have recklessly precipitated industrial warfare. In what terms shall we characterize the men whose lack of the spirit of good citizenship has made possible this lawsuit?

The Federal Government is elaborating legislation which will, when perfected by experience, largely dispense with strikes and lock-outs. If such legislation is necessary to protect the country, all the more necessary is a law which will prevent the owners of public utilities, the operators of subsidized industries, from indulging in internecine war at the expense of the community.

We still pray that, even at the eleventh hour, the feud will be patched up. It is a hopeful sign that one of the litigants has voluntarily offered to submit the matter to any disinterested referee.

Thousands of dollars have been absolutely wasted,

worse than wasted, in proving and disproving a speculative geological point, in establishing and denying the metallurgical value of a certain class of coal. If money is so readily available for these futile purposes, why should not equal amounts have been long ago directed into construction and expansion?

THE ALBERTA COAL COMMISSION AND THE BRITISH EIGHT-HOUR BILL.

Recognizing the imminent danger of a recurrence in the West of last winter's coal famine, the Alberta Provincial Government appointed a commission to inquire into the conditions of the production and marketing of coal and to make recommendations as to the necessary measures for the prevention of fuel-shortages in the future. The report of the commission has been handed in. The salient points are as follows:

1. That the government endeavour to induce individuals and companies to store coal during the summer for use in winter, and to keep a reserve supply on hand.

2. That legislation be passed in regard to the erection and licensing of storage warehouses, which would enable agents and dealers to purchase and store coal during the summer.

3. That the necessary measures be adopted to compel railways to furnish cars for the prompt handling of coal. The principle of reciprocal demurrage is recommended in the event of other means failing.

4. That where mine operators experience difficulty in securing the construction of sidings, each case should be investigated, and if the construction be practicable, the Provincial Government should join the operator in presenting his case to the Railway Commission.

Having dealt thus with the question of fuel supply and transportation, the commission makes certain other recommendations for the improvement of the conditions of the miners. Principal among these are:

That the inspection of the ventilating equipments be more rigid.

That the erection of bath-houses for the use of the miners be made compulsory.

That the minimum age of employees be sixteen years.

That the distance between openings to a mine be not less than one hundred feet.

That provision be made for the rapid and cheap settlement of questions of damages.

Upon the "eight-hour day," the commission's report does not touch. It is stated that the Provincial Minister of Works has promised the introduction of legislation making the eight-hour day compulsory.

The commission has done well to avoid a definitive expression of opinion upon the "eight-hour" problem. The experiment of such a working day is presently to be tried in England. The Albertan Government will lose nothing if it defers action until the result of the British experiment can be noted.

The government "Eight Hours" Bill, which was introduced into the British House of Commons on August 1st, date on, only the eight-hour day, bank to bank, is to be makes legal the nine-hour day for eighteen months, from January 1st, 1908, to June 30th, 1909. From the latter permitted. The shift will be measured from when the first man leaves the surface until the first man comes to the surface, and from the last man down until the last man up. Limiting clauses are inserted, providing for an extension of the day in times of war or of industrial stringency. For this purpose the Ministers of the Crown are clothed with discretionary powers. The bill will not become law until next session. The full text will be found on another page.

A PERSECUTED PRESIDENT

The University of Toronto's newly appointed President has undergone a trial so severe, so dangerous and so soul-disturbing, that if he survives without permanent injuries he is a fortunate man.

Nova Scotians are not temperamentally demonstrative. This fact makes their outburst of appreciation (adulation, we had almost written) all the more remarkable. They have feted and feasted Dr. Falconer. They have told him, in language calculated to induce abnormal cephalic expansion in the ordinary or garden variety of man, that in his own proper person he embodies all the cardinal virtues, most of the graces, and a large slice of human culture and knowledge. Dr. Falconer is, however, a modest man. When the early morning brings its cooler counsels, he will realize that it were suicidal to attempt to live up to Nova Scotia's seraphic ideal. It will also dawn upon him that no ordinarily sinful professor could afford to be associated with such a flawless paragon.

However and however, we hope—we know—that the new President has limitations, even weaknesses, not mentioned in the specifications used by Nova Scotia when she so fervently set about constructing her ideal Falconer. We know that Dr. Falconer is a cool-headed, strong, kindly and cultivated man. Already he has done most valuable work in educational spheres. His influence has been profoundly felt in the Presbyterian Church. With the help of his Toronto confreres, success is assured him.

We find ourselves falling constantly into the irritating habit of giving advice—a dangerous thing for all concerned. But, nevertheless, we cannot refrain from exhorting President Falconer to keep a paternal eye upon his Department of Mining Engineering. So far as we are concerned, he may slight Exegesis, he may neglect Church History, Hebrew he may delete, Dogma may fall into innocuous desuetude—not a murmur will be heard from us. But the everlasting principles of smelting, the mutable practice of mining, the mysteries of mineralogy, the divine dubieties of geology, the sempiternal canons of chemistry, must never be overlooked.

THE WEST—ITS FUEL SUPPLY.

Experience teaches—but governments learn more slowly than individuals. During last winter the Western Provinces hung for months on the perilous brink of a fuel famine. Newspaper reports gave harrowing details of privation and suffering. Often these stories were exaggerated. Sometimes they were untrue. But there is ample evidence that throughout the whole Canadian West the fuel shortage was seriously felt.

Indications are not lacking that the approaching cold season will bring with it conditions similar to those of last winter. Labor troubles, transportation difficulties, a rapidly increasing population, and the demands of expanding industries make the danger of a fuel famine more than possible. But even were the possibility of a coal shortage remote, and not, as we have reason to believe it to be, imminent, it would be only prudent for the Federal and Provincial Governments to take very precaution against a recurrence of such a condition of affairs as obtained last winter.

The railroads are busily safeguarding their own fuel supplies. They should be, and must be, held accountable if, through negligence or through inefficiency, they are unable to meet the reasonable demands of the people. But the volume and continuity of the fuel supply is as completely dependent upon the miners themselves as upon any other factor. A strike can work more havoc than the indifference or inability of all the railway systems together. The right to strike, when the comfort, nay, the lives, of thousands of human beings, and the welfare of an enormous commonwealth may be imperilled, may well be controlled by the Federal authorities.

It may here be remarked that, so far, the Lemieux Act has been a negative, rather than a positive, blessing. To give it greater efficacy, revision and additions are necessary. It is now hardly more than a tentative attempt at practical arbitration. In principle it is sound; in practice it appears somewhat weak. It may become necessary for the Dominion Government to amend the Act radically. If, however, hot-headed operators and contumacious workmen are set upon quarreling, the final remedy is government ownership and operation of the coal mines. Meanwhile, the Western fuel situation must be met. The responsibility of meeting it rests primarily upon the government and the railroads.

EDITORIAL NOTES

Talc and soapstone have been steadily increasing in value during the past decade. Hastings County, Ontario, has the only large producing mine in Canada.

The importation of sulphur into the United States has decreased by over fifty per cent. in the last three years. In 1900 the exported sulphur from Sicily to the United States stood at 162,505 tons. In 1906 this had fallen to 41,283 tons. Meanwhile there has been a steady growth in the consumption, importation and production of pyrite. This movement is of great significance to the holders of pyrite properties in Canada.

SOME REFLECTIONS ON SECRECY IN THE ARTS.

Dr. James Douglas

(Continued from August 15)

Faraday's mind was too absorbed in wonderment and almost religious fervor as the secrets of nature revealed themselves, to be captious, and to waste his energies in defining exactly what he had done, or in defending his discoveries and great conceptions from supposed infringement by other scholars. He never forgot, despite his wonderful original work, that generally the great investigators only lay the keystone in the arch which many less gifted workers have been erecting stone by stone. He did not consider it any detraction from his honor that he merely crowned the structure, but had not built it from the foundation. In fact, they are the greatest among the great who appreciate this limitation and recognize what they are to others. It is they who enjoy the beatitude of the meek, for in the highest sense they inherit the earth, seeing that they are endowed by the Creator with some feeble insight into the very secrets of earth and heaven. They know that these secrets are but the laws and phenomena of nature, which we through our ignorance and prejudice are slow in understanding, but which would soon cease to be secrets, if we could only disabuse our minds of false conceptions, and see facts as facts instead of as arguments for our theories.

Faraday felt, as every true disciple of science should feel, that when we penetrate to the discovery of even the least important of the facts of nature, we are unveiling one of God's gifts to humanity, and if so, we have no right to draw the curtain over it and conceal it again from God's children in order that we may make money out of it. Looked at from this point of view, may we not question the right to buy men's thoughts, and when through their thoughts we have unravelled some of nature's secrets, and learnt something to our profit, use our power to impose secrecy? Are we not enslaving a human mind, and can any slavery be worse? A natural phenomenon or force, one so understood that it can be controlled, is it not as much a gift of God as rain and sunlight and therefore part of the heritage of all mankind? Corporate wealth and corporate energy are doing much for mankind, despite the fact that of corporate shortcomings we hear just now more than we do of corporate benefactions. But corporate influence will have reached its most beneficent development when the wealth and activity and masterful management of the able men who wield it are united to the knowledge and skill of their technical staff, in not only discovering but

publishing the truths of nature, which they may be agents in discovering. Nor are we over-sanguine in believing that this high aspiration if carried into practice would not interfere with the lower motive of their existence—money-making.

Nor is Sir Michael Faraday the only scientific worker in the field of practical science who has given the results of his labor unreservedly to the world. It is almost invidious to single out instances when so many distinguished men and such a multitude of obscure toilers are working at the intricate problems of technology from sheer attachment to truth and without any thought of gain. But three notable names may be mentioned, as representative of this noble army of the unselfish, our own Prof. Henry, Dr. Roentgen, and that devoted couple, whom we rank as one, for they as husband and wife were as devotedly in love of one another as they were one in love of science—Mons. and Madame Curie. The Roentgen Ray may have needed no patents, or patentable devices, or any business organization to push its beneficial applications, especially in the alleviation of suffering humanity, but it would not have been difficult to concoct patents had Dr. Roentgen, before describing his discoveries, wished to make money out of them.

And could the practical resources of radial activity be measured by dollars, what a fortune the bereaved widow would reap! But Prof. Roentgen enjoys a better harvest than royalties, and Madame Curie would not exchange for a mountain of gold the world's admiration and its reverence for her husband's memory.

But to descend to a lower plane. If it is the fact that technical science has progressed of late with such unwonted speed through the co-operation of many workers, and that this co-operation has been made possible by the publication and exchange of ideas and experiences in the technical and scientific journals, would not our progress be even more rapid and thorough if all barriers of secrecy were broken down and every encouragement were given to our technical workers not only to describe in print and by conference their notions and their actual experiments? This is the attitude of some of our large concerns, but unfortunately it is not that of all. It is impossible to compare the efficiency of works whose gates are fast shut, and where obscurity and secrecy are imposed and practiced, with those to which free admission is granted and where freedom of information is encouraged. But the following reflections force themselves upon us in this connection. We know that very few technical papers issue from certain establishments, that on their officials silence is imposed, and that to these inquisitive visitors are politely but peremptorily refused admission. There are not many such, but they are and have been very successful. But suppose that in imitation of their practice and regulations, all were tempted to adopt it, and thus the same policy became universal, what a sudden paralysis of industry would follow. Our secretaries would find it difficult to fill even their shrunken volumes of transactions with papers worth printing; our students would have to content themselves with what antiquated learning their professors could supply them with, for there would be no more summer classes for practical work in mines, smelters and electrical factories, and the professors themselves would have to learn from old books. Every manufacturer and smelter would be obliged to bribe his neighbor's workmen and tempt away his neighbor's superintendents for information. As a result before long the very workers which now find it so profitable or think they do, to tap their friends' stock of knowledge and experience, and give nothing in return, would be driven in upon their own resources, and probably not then find them so complete as they imagine. Of course I am supposing an impossibility, because the spirit of intellectual freedom in our professions is too strong and too widespread to submit to such a tyranny and because before such darkness of ignorance had settled down on our great industries, the most pronounced advocates of secrecy would feel and acknowledge what the ultimate consequences of concealment are, and would become reformers. To-day they may have valuable secrets, as valuable as Sir Henry's method of making plate glass and bronze powder, and it may pay them to conceal them from their competitors, as long as they are admitted freely to their competitors' open shops, but even this is doubtful. For the spirit of secrecy is intimately allied with the spirit of suspicion and distrust, and the mind which is always suspecting is closed tight against the admission of liberal impressions. Being jealous of others, it is prejudiced against their suggestions, and correspondingly prejudiced in favor of its own preconceptions. Progress, therefore, ceases.

This is a temper of mind foreign to a new country like this, whose special industries have not been established long enough to wear grooves of rigid practice and sink into ruts of self-satisfied indifference. About the best correction we can apply to the growth of dry rot is the banishment of secrecy. A curious instance of its blighting influence is seen in some of the older, not the newer, industries of the old world. The iron and steel works of Europe have not kept pace with ours in size and production, but the ironmaster of Great Britain and Germany in coke-making and in blast furnace economies, and in steel-making processes, have been our teacher. Nor have they been shy of communicating their improvements, nor through jealousy of our success, slow in adopting ours. No nobler monument of international comity exists than the seventy volumes of the Proceedings of the Iron and Steel Institute. And with few exceptions the iron and steel works of England, Scotland and Germany and France are open to any accredited worker in the same domain. But before England was conspicuous as a maker of iron, she was famous the world over for her copper and tin production. But what between self-conceit and the inbred habits of trade secrecy, her copper smelting industry has fallen from its high estate. And it is not accidental, but linked as closely as any effect with its cause, that this decline is in great part the result of habits of secrecy which grew with the growth of age. At Swansea every gate to the smelting works is guarded, and as a result it has been difficult for thought to escape out as for suggestions to find their way in. She should still enjoy the prominence which her skilled labor, splendid coal and commanding maritime situation put within her reach, but she has preferred clinging to her secrets behind closed doors rather than going out into the world in search of new business as well as technical methods, and inviting the world to enter and exchange ideas. And that notwithstanding that the first practical application of electrolysis to metals was made in England by Elkinton, and that the Vivians adopted the Manhes method before Farrel introduced it into this country. But what feeble use they have made of these great improvements. The Atlantic separates continents, but it does not delimit the operation of laws. And therefore what is baneful in its effects in Europe is not likely to be beneficial here.

In political life vitality is maintained only when every man takes his full share as a debater in the dis-

cussion of political questions, and as a voter in the determination of state affairs. So in scientific and technical matters, the banishment of deceit, mystery and jealousy, and the freest admission of daylight through the most unreserved diffusion of information, through the press and by personal intercourse, will instill into the whole body of workers a feeling of healthy rivalry which, while stimulating their mental activity, will correspondingly benefit the financial interests of their employers.

I have supposed an extreme case—that the example set by our few secretive establishments is followed by all. Let me imagine a more probable issue, which I believe such a fellowship of knowledge and experience as Mr. Carnegie asks the United States Engineering Societies to cultivate by presenting us with our home in Thirty-ninth street, will bring about, viz., that it will come to be appreciated by all our technical manufacturers that they will gain and not lose by encouraging their technical staff to study their neighbor's methods and throwing open their establishments to the free criticism of their competitors in trade. What will result? Nothing but gain, I believe, to all whose wisdom and means have enabled them to provide themselves with the raw material of manufacture on advantageous terms and to locate their works or factories at localities favorable for economical operation. Loss only to those who in any case should go out of business because they have failed to secure the conditions essential to success. But above all, advantage to the public, which after all is the finality we should always keep in view. How can these two conditions—financial success and public approval—be best attained. Unquestionably by mutual help and the most unreserved publicity. Take any branch of industry. No intelligent worker in that branch claims that he and his staff have attained either the utmost economy in operation or thorough acquaintance with all the reactions which enter into the processes which he practices. He knows that there are hundreds of others, intelligent and well-informed, all eagerly at work on the solution of the same problem. Some may be a little cleverer than others, and some may have made a little more progress in certain lines than their co-workers. But this discrepancy will not necessarily continue, for the clever fellow is picked up by rival works, and the secret so carefully guarded leaks out, and therefore the disturbed average of paid ability and of the stock of knowledge is restored.

As I have said—with certain reservations, and by special permission—many of our larger establishments in all or certain departments are freely open to each other's technical officers; but instead of being admitted by sufferance, they should be invited in with full liberty to study processes and test machines, for assuredly the host would benefit as much as the guests from the discussion which would follow such unreserved exchange of ideas and comparisons of appliances and methods.

I have also referred to certain limitations to publicity. One undoubtedly is costs. Under our present economic system, no manufacturer or miner or metallurgist cares to give away his costs, and that for very obvious reasons. What they are may be inferred, but professional courtesy forbids direct inquiry into that delicate subject. This restriction, however, need not interfere with unstinted technical freedom of intercourse. There is, moreover, another judicious limitation to publicity. Most of our largest concerns are incorporated and financed as joint stock organizations, in which thousands of technically ignorant and helpless shareholders are interested, and unquestionably indiscriminate admission to works and mines must be refused, for unfortunately there are visitors who, if admitted, after the visit would tell remarkable stories, from actual observation, with the view to affect the value of stocks. But such restrictions do not affect the main proposition that mercantile concerns of every class depending for success on technical knowledge and skill would gain by the removal of restraint on their technical staff.

I am not blind to the fact that the same object is sought to be attained by the consolidation of many works under one organization, or by the encouragement of friendly financial co-operation among even competing companies; but this tendency to consolidation has not yet succeeded in obliterating competition and will not as long as there are active, intelligent men in our midst who prefer to rule rather to be ruled, and to manage their own business rather than have it managed for them.

On the benefits or disadvantages of the present movement towards consolidation of works and the combination of capital in large industrial undertakings there is, and will be of course, considerable diversity of opinion. That competition is wasteful and is encumbered with other evils few will deny, that it has a keenly stimulating effect all will admit. Yet it remains to be determined whether a board of absentee managers and paid officials will be a compensating substitute for the ambitions, personal pride and tireless energy and skill of the individuals who have built up great works which they may have seen perhaps reluctantly absorbed into the combination. But one dangerous tendency will almost inevitably creep in. The larger the combination grows, the more sensitive will the management be, lest business and trade secrets be revealed by subordinate officers. The imposition therefore of strict rules of silence on all except those in supreme command is likely to result. If the absorption of any one class of our national resources should pass under the control of any one organization, the technical knowledge necessary to the development of this particular resource would be of interest to that organization alone, and the risks of publicity, and therefore the evils of secrecy, would become a merely academic question. Under our present undeveloped system this dangerous point probably will not be reached, for state socialism, to which concentration steadily approaches, would be the inevitable alternative and would be adopted before the other alternative had been attained. But it must be to the management of those enormous consolidations a grave consideration how they can give such latitude to the members of their staff as will produce that healthy self-reliance which comes from freedom of speech and freedom of opinion without endangering the tremendous financial interests for which they are responsible. But public opinion has been consulted and placated and therefore would it not be safer and better for the interests of their shareholders to adopt the policy of freedom which I have outlined? For the growing public anxiety, amounting to animosity and suspicion against our big corporations would be allayed if it was apparent that the technical officials of the small concern had at least the right of knowing what the big concern was doing, and the big official did not arrogate to himself the possession of exclusive knowledge and exclusive skill. From the point of view of public policy, the question is one well worthy of consideration, for it is coming about that not only railroads, as public highways, but all large corporations utilizing the country's natural products and converting them into necessary objects of trade, will pass under closer legislative scrut-

iny and public criticism in the future than they have in the past.

Unquestionably dangers can be foreseen as arising out of these great industrial aggregations—not only of capital but of industrial energy—dangers technical, social and political. There are also great possibilities of good. One of the benefits may justly be claimed to reside in the large funds that are available for and are devoted to technical research, and from which the public secures benefit indirectly—even when the results are not published. But if we could banish secrecy; and every industrial establishment of any magnitude, which is in its own interest carrying on technical research, should encourage its technical staff to confer freely with the members of every other technical staff, would not the sciences and are progress far more rapidly than if even one large organization should control any one industry? All our principal metallurgical and chemical concerns have laboratories, and carry on investigations and make experiments, generally on a large working scale, and therefore is not the advancement of science and technology better attained in a number of such laboratories than if there were fewer or only one? There is keener competition of wits when many brains are working independently. The friction of honest, active rivalry is a force not to be despised. The stimulus of ambition, and the still higher stimulus of love of truth, is sure to be stronger when men are free and not impelled by purely sordid motives. The air in such laboratories is freer and purer than where men are working under the stifling atmosphere of secrecy. I believe that such consolidation of mind and high motives would carry us further and faster along the road of human progress than all the trusts could appropriate for the advancement of technical knowledge.

WESTPHALIAN COLLIERIES

Impressions of a two days' visit.

(By Our Special Correspondent.)

Illustrations used with permission of the publishers of "Gluckauf."

The amount of actual data that it is possible to collect in a two days' visit is small, but the general impressions of a cis-atlantic miner on his first visit to the Westphalian coalfield, may interest the readers of THE CANADIAN MINING JOURNAL, if only from a point of view of comparison with mining methods on this side.

The busiest portion of the Westphalian coalfield lies within the triangle made by the cities of Düsseldorf, Cologne and Dortmund on the western shores of the Rhine. In this comparatively small section is to be found a very numerous and thriving industrial population engaged in coal mining, iron and steel making, and all the various subsidiary industries to be found in connection with these staples. The district includes the town of Bochum, with its famous Mining School, Essen, with its enormous Krupp Works, and the towns of Gelsenkirchen, Herne and Crefeld. Unlike so many coalfields, owing to the fact that the coal measures are overlaid largely by alluvial beds deposited by Father Rhine, the land is a fat one, and the farms and gardens encroach almost on to the colliery grounds. The Westphalians are a big and jovial race, and stoutly maintain that there is no country like their own, and no land where the "wine is so good, or the women so fair."

The mining industry of the Ruhr district is of comparatively modern development, its beginnings dating back only to the seventies. To-day, however, the Ruhr district supplies 60 per cent. of the total coal, which in 1906 was over 130,000,000 tons, exclusive of 56,000,000 tons of brown coal or lignite. Everywhere in Westphalia one is confronted by signs of an industrial prosperity and expansion that is almost amazing, even to one accustomed to the way they do things in Canada.

After the obvious newness and growth of the mining industry, one is impressed by the extraordinarily lavish expenditure made by the colliery companies on their surface erections and layouts generally. The word "extraordinary" is used advisedly, and the conditions must be seen to be realized. Even when one is actually on the ground one has a distinct feeling of unreality, and feels as though the whole thing were a "fairy tale." To a person accustomed to the strictly utilitarian policy and the careful expenditure of American and English coal operators, the methods of the German coal owners are astounding, to put the case mildly.

The ability of the German collieries to make such large expenditure is largely due to the huge coal trust known as the Rhenish Westphalian Coal Syndicate,

Head Office—Rheinelbe.

which corporation absolutely controls the Ruhr market. This syndicate controls 80 companies, and in 1906 produced 76,631,431, or 90 per cent. of the total output of the Ruhr district. The policy of its directorate is to allocate at the beginning of each year to each colliery under its control a given output. It operates to the fullest possible extent such collieries as are profitable to work, and reduces the output of the less profitable collieries to a minimum, compensating them according to a fixed sliding scale rate. The operations of the trust have resulted in large profits for the syndicated col-

lieries, and its policy is never cheese-paring where results are anticipated.

The natural conditions under which coal is mined in Westphalia are by no means so easy as obtain on this side of the water, and we should not attempt to work seams such as are very generally and profitably worked in many European mines. A large number of the German seams are steep, and the mining methods pursued necessitate a great deal of cross measure drifting, ladderways, chutes, etc., expensive features that we are not very much bothered with in this continent of big coal seams. The seams are mostly thin, and some of them exceedingly dirty and "brassy."

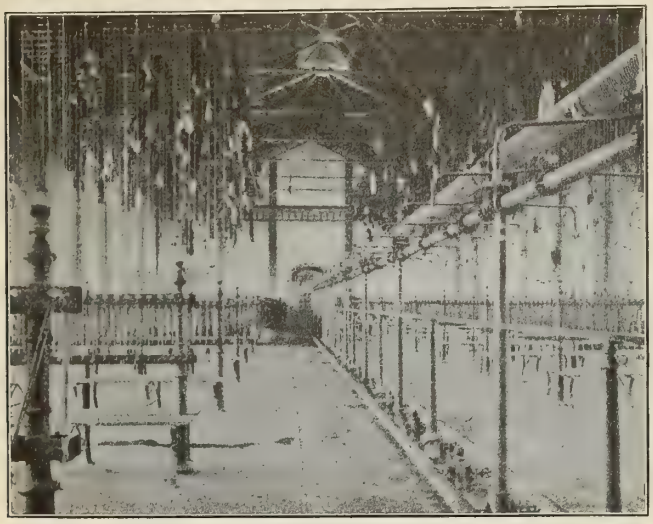
The generally dirty and impure conditions of German coals has caused the Germans to become pioneers in coal-washing, and their product is washed and sorted for the market with great care. In some of the collieries there the whole run of mine output goes directly from the pit mouth into the washer.

View of Zollern Colliery No, 2, Sbowing Main Entrance.

A typical Westphalian colliery is Zollern II., one of the mines of the Gelsenkirchen Company. The illustrations accompanying are reproduced by permission of the editors of *Glückauf*, the leading mining journal in Germany, and they will convey some idea of the elaborateness of German layouts. Referring to the large photograph of Zollern II. in detail (see Fig. 1), in the centre will be noticed the general executive office, the inside of which is no less elaborate than the outside. To the right hand is the main drawing shaft, with its fine steel headgear and the shelter roof over the pulleys. This headgear is typical of those found all through Westphalia. The whole of the right wing is under one roof, which includes the shaft also. The wing consists of a storehouse for small materials, lamp room, "lohnhalle" or pay hall, and a wash house (waschkaue). The latter is a feature of all Westphalian collieries, and one rarely sees a dirty workman on the public streets. The lohnhalle is a lofty and roomy building, which can be heated if required. It is used as a waiting room generally, where the workmen are protected from the weather at meal times, pay days and shift changing. A door opens from this hall into the wash house. This is a huge building with concrete floor provided with runnels and grates for the waste water. The walls are tiled, and the place is well lighted. There are 75 shower baths, provided with hot and cold water, so arranged that the temperature of the shower can be adjusted to please the user. Depending from the roof are numerous cords, counterbalanced, and passing over pulleys in the roof. On coming to work the miner divests himself of his clean clothes, lets down his pit garb, which has been suspended in a current of hot air near the roof since his last shift, and hoists his clean clothes in their places. After dressing he obtains his lamp from the lamp house, and any materials or tools he requires from the store room. Then he proceeds to the shaft, never being exposed to the weather after he enters the hall. Similarly, returning from work he is not liable to catch cold in his heated condition. He goes directly to the wash house, where he speedily cleanses himself, thanks to the strong pressure of the warm shower bath. He dries himself on the benches provided for this purpose and goes out of the colliery grounds fully dressed. The workmen provide their own soap and towels, and are required to take home their pit clothes for cleansing at stated intervals. The wash house is free from any objectionable odor, and is kept very clean. A separate bathing place is provided for boys under the age of eighteen.

The left wing contains the colliery shops, and near them are the stables and the fire station, where horses and fire fighting appliances are kept in instant readiness. Behind the air shaft, which is connected with the main drawing shaft by an overhead trestle of rather ornamental design, is the closet convenience, which has been adopted at all German collieries since the spread of ankylostomiasis. Thanks to sanitary measures of this kind, to the wash houses and the underground closets provided, not only is ankylostomiasis on the decrease, but other contagious diseases, such as miners' opthalmia, are less prevalent.

The "maschinenhalle" is distinctive of Westphalian collieries, all the more important machinery of the colliery being assembled in one large building of an expensive and very often artistic design and treatment.



At Zollern II., the "maschinenhalle" has a floor space of 2,000 square yards, and contains the following machinery:—Three duplicate triple expansion horizontal steam engines, with direct coupled direct current dynamos. Only one of these units is in use at one time, the engines run at 90 revolutions, the flywheel is 20 feet diameter, weighing 32 tons, and the horse-power is 1,500 normal, 1,950 maximum. The generators are 500 volts, normal 1,100 and maximum 1,450 kw. The most important piece of machinery that derives its power from these generators is the winding engine, built by Siemens & Halske, for hoisting by the Koepe system. An Ilgner compensating or equalizing set is a feature of this winding installation, and it is said to obviate to a very marked extent the fluctuation in the load which is a principal objection to electric winding in deep shafts. The Ilgner machine at Zollern consists of a 300 h.p. direct current motor and a direct current dynamo, lying on either side of a massive cast steel flywheel 12 feet in diameter and weighing 40 tons, all three rotating with a common axle. The motor is fed from the main transmission and its voltage is kept constant at 500 volts. The power for

the winding motor is generated by the dynamo on the other side of the flywheel. The enormous energy stored up in the massive flywheel is used to help the engine over the peak of the load, while keeping the drain on the main transmission at an almost constant figure. It is the intention of the management to duplicate the present winding engine, and space has been reserved for this in the "maschinenhalle."

In the middle of the building are two electrically driven air compressors. Each compressor will deliver 2,300 cubic feet of air per minute at 130 revolutions.

The colliery is lighted from the main transmission by two transformers, situated near the compressors.

As may be seen from the illustrations, the building is worthy of the machinery. The floor and walls are tiled throughout, the windows are of stained glass, and everything is in keeping. The entrance to the "maschinenhalle" was designed by a prominent architect, and to one accustomed to more sober methods nothing could be less like a colliery engine house than this elaborate erection. But after all, is there not some justification for the German viewpoint? When the writer expressed his astonishment at one of these "maschinenhalles" to a German engineer, this gentleman said: "What does it matter when you spend $1,000,000 in machinery if you spend a few hundreds to make it look nice?" He said his experience had shown that the workmen respected themselves more and looked to their machinery with more zeal and care than when it was housed in poor and cheap buildings. When entering some of these buildings the writer found himself unconsciously taking off his hat.

Interior of Wash House.

The remainder of the Zollern layout calls for no particular mention. The fans are electrically driven, and give 210,000 cubic feet of air at 192 revolutions and 4 inch w. g. There is the usual washery, and retort oven plant with by-product recovery plant. One might mention that there is no noticeable effluvia from the sulphate houses at these recovery plants, and as may be seen from the illustrations it is possible to farm in their immediate vicinity.

The Zollern plant is designed for an output of 2,000 tons a day with a force of 2,000 men. To Canadian ideas this is a small yield per man, but it is not possible to institute an exact comparison in this respect, as our seams are so much thicker and easier to work.

The above description, though necessarily very incomplete in a general article of this kind, is typical of most of the collieries controlled by the syndicate.

Over and above the elaboration of the strictly productive part of the German colliery plants, one is impressed by the attention that is devoted to the prevention of accidents and what might be termed the humanitarianism of their policy, as evinced by the rescue stations, hospitals, etc., that one sees everywhere.

At the Shamrock colliery, Herne, we were shown over the accident room. The chief director at Shamrock is Herr G. A. Meyer, the gentlemen who led the Westphalian rescue corps at the Courrieres explosion. Herr Meyer is well known in mining circles, both in his own country and in England, and has always taken a great interest in every form of life-saving apparatus. He is himself the patentee of the "Shamrock" apparatus which was used at Courrières. We were shown over the accident room by the colliery policeman, a very stout and genial person in full military uniform, who was most anxious we should understand everything, and was evidently an enthusiast in his work. The room is entirely tiled with glazed white tiles, both floor and walls, and is adequately lighted. It contains three large baths, fitted with the most modern plumbing devices for washing and spraying, and an operating and bandaging table. A small crane runs along the roof with a two-way motion, so that the stretcher depending from it can be placed in any desired position. By an arrangement of strips forming the stretcher proper an injured man can be transferred from the mine stretcher with the minimum of motion. He can then be suspended over the bath, and washed, then moved over to the bandaging table and splinted as desired, and finally deposited in the ambulance, all with the least possible jarring or movement that would be likely to cause pain to an injured man. We were told that our policeman friend was such an expert in bandaging that the doctors never or rarely found it necessary to remove his bandages on the admission of the patient.

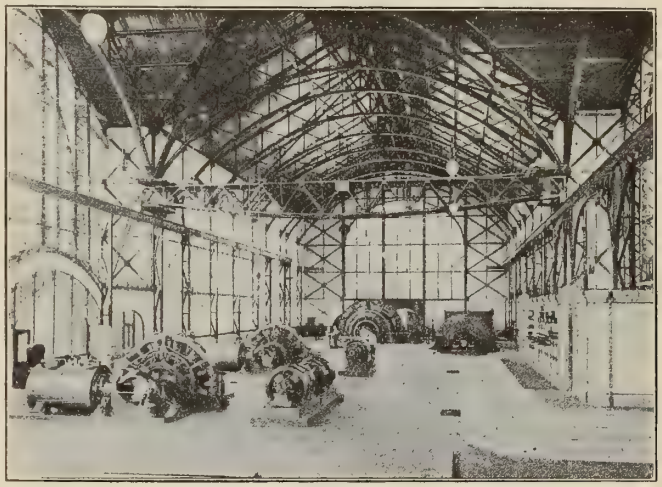
The place was almost ostentatiously clean, everything white and shining. Cupboards along the walls contained all necessary antiseptics, elastic and other bandages, special wire splints for specific injuries, restoratives, wines and spirits, surgical instruments, etc. One felt that everything possible was provided for injured workmen, and that nothing was left undone for their comfort. The place would be a credit to any metropolitan hospital.

Our correspondent also visited the Rheinelbe collieries, at Gelsenkirchen (see illustration). This colliery is possibly more elaborate than Zollern, as it is newer. It is one of sixteen collieries belonging to the Gelsenkirchener Bergwerks Aktien Gesellschaft.

Here we saw the "feuerwacht" or fire station. This building is better equipped than the fire station of many cities. We inspected first of all the rescue station, which consisted of a room fitted with several score breathing apparatus. Along the corridor was posted up the names of the members of the corps that were detailed for duty that day, should occasion arise. Connected with this room was a practising gallery, arrranged to represent as nearly as possible underground conditions, which could be filled with noxious gases, enabling men to practise the wearing of breathing apparatus under conditions as nearly as possible actual. The practising gallerying is fitted with windows by which the work of those practising can be watched from the corridor.

Outside the rescue station we saw a fully equipped diver practising in a huge tank filled with water. He had three men in uniform to attend to his air supply.

Then we saw the fire station proper, and our corres-



pondent was the first person from Canada to sign the visitors' book, a circumstance that necessitated considerable drinking of healths. In the fire station office were all sorts of electric alarms, telephones, tickers and tape machines, communicating with all parts of the Rheinelbe colliery itself above and below ground, and with the town of Gelsenkirchen and the other collieries of the district. The equipment of the station comprises a fine fire engine, chemical engine, hose reels, ladder cart, etc. The stable held eight horses, two in constant readiness. The firemen are always on duty and sleep on the premises. The superintendent, a very courteous young German in full uniform, was showing us round when the alarm rang in from Gelsenkirchen, and although our presence was a hindrance, the brigade turned out in thirty-four seconds.

This fire department is maintained entirely by the Colliery Company itself, and is duplicated at every colliery of this particular corporation. In the case of a colliery fire or explosion the united brigades of a district turn out, as they did at the Reden explosion, where over 180 trained men equipped with breathing apparatus and various rescue appliances responded to the alarm.

The Gelsenkirchen Company are also very careful of the welfare of their workpeople. All the houses have large gardens and are well built of stone and brick. The officials' houses are three storey buildings, the equivalent of a $30 or $35 Canadian house rented by the month. They also have large gardens fully enclosed. The company provide also an infant school for the children of their workpeople, hospital and recreation grounds. The officials have their casino, where wines and beer are sold and billiards and other amusements provided. The average wage of the workmen employed by this company is M. 4.36 per shift, and about M. 1,300 per year. The company employs over 21,000 men, and raise annually about five and one-half million tons. With all their elaborate layouts they pay dividends of from 12 per cent. to 15 per cent.

There is no lack of amusement around the collieries, the "Theatre" and "Bierhalle" being much frequented, as are also the various mining schools and lectures. Teetotalers are unknown in Westphalia, and indeed the existence of such being is regarded there with some incredulity. How differently two nationalities may regard the same subject may be gathered from a remark overheard by the writer when seated in the official casino at Rheinelbe colliery. After clinking glasses all round with about a dozen of the officials of this colliery, and giving to each the orthodox greeting of "Prosit," we discussed the customs of our two races, and one of our guides was at much pains to explain to his compatriots that "der Herr" drank no wine in his own country, and that in Canada it was quite possible to refrain from drinking with one's friends, and "yet be respected." And this statement evoked a pitying smile all around the table. Yet can it be said that there is less drunkenness around our Canadian mines than there is in Westphalia? From what we saw there drunkenness is rare indeed. With the German to drink is a normal daily habit, and he does not indulge in abnormal excesses.

The German colliery owners are quite as ready to scrap out-of-date machinery in order to adopt newer and better devices as our friends across the line. In the matter of economics in colliery consumption in particular, their policy is progressive. At most collieries, some, if not all, of the boilers are heated by superfluous gases from the coke ovens. Latterly great attention has been devoted to electric power generated by gas engines, fed by purified waste oven gases and gas producers. At Zollern exhaust steam turbines are being used with marked economy. Recently when considering the provision of more power, it was found that there was available for the purpose of driving an exhaust steam turbine about 35,000 pounds of exhaust steam, coming from a compound fan engine with 22 inch cylinders, and two compound winding engines having 36 inch and 51 inch cylinders respectively. This exhaust now actuates a turbine connected to a 900 kw. dynamo. The result of a recent test reported in *Glückauf* gave figures as follows:—Amp. 596, volts 1,121, kw. 1,112, with an expenditure of steam per kilowatt hour of 31.6 pounds. This was of course in conjunction with a central condensing plant. Condensing plants are to be found at practically all the Westphalian collieries. With coke oven gas fired boilers and condensing plants there is very little smoke or steam around these collieries.

Interior of Power House.

Our correspondent met with every courtesy during his short visit. Although everybody was exceedingly busy, yet at every colliery someone was found who devoted his whole attention to us while we were there. It was rarely that we did not find somebody who would speak English, and the linguistic abilities of the German engineers is surprising when one considers how severe have been their studies along purely technical lines. We saw evidences everywhere of the high technical education of the mining community generally, both officials and workmen. The excellence of German technical education is, however, such an admitted fact that it is unnecessary to enlarge upon it here. A very striking feature of the collieries is their general neat and tidy appearance. They looked all of them as though the Board of Directors were expected at any time to make inspection. The workmen also were neatly and sensibly garbed, and of good physique. How much of this is due to their military training would be an interesting question. On enquiring whether the military service required of every man affected adversely the industrial situation we were answered with a smile, and assured that its effect was quite otherwise, and that much of the present industrial success of the German people is to be attributed to the habits of order and discipline inculcated by military life. Certainly discilpline and order seem to be the first considerations in any German works. Perhaps, to Canadian ideas, they push these ideals too prominently into the foreground, but results have been obtained, and there are quite a few things to learn over in the Fatherland.

ANKYLOSTOMIASIS

"Miner's Anemia."

By F. W. Gray.

(Continued from August 15)

Westphalia.

Ankylostomiasis has been known to exist in the mines of Westphalia since 1886, and during the years 1892 to 1895 enquiries were being made at the instance of the German Department of Mines, but no further steps were at that time deemed necessary than the examination of foreign miners, more especially those who came from the brickfields of Gelgium, and a superficial examination of the underground employes for facial signs of anemia at the various mines by a medical officer as the men filed past on pay days. That there was no reason for alarm will be gathered from the figures following. Up to 1899 these show a steady decrease in the number of cases, but it will be noted that a very rapid rise took place in 1900:—

1898—107 cases in 16 mines, equals 6.4 per 10,000.
1897—113 cases in 32 mines equals 6.2 per 10,000.
1898—99 cases in 24 mines equals 4.9 per 10,000.
1899—94 cases in 27 mines equals 4.4 per 10,000.
1900—275 cases in 42 mines equals 11.7 per 10,000.
1901—1,030 cases in 65 mines equals 40.6 per 10,000.
1902—1,355 cases in 69 mines equals 52.9 per 10,000 (first 9 months only).

It is very generally admitted that the introduction by the Government in the early part of 1900 of compulsory water sprinkling in all dusty and fiery mines explains to a very large extent this suddent increase in the extent of the infection. The object of the sprinkling order was to lessen the danger of fire and dust explosions, which in the past had caused the loss of many lives, and this object was achieved. The order was very thoroughly carried out, pipes being laid all over the mines, provided at convenient distances with spraying nozzles which distributed water in the form of a fine dust. Before and after every shot the working places were sprayed most effectively, and the whole mine was filled with moisture. Some persons deny that the sprinkling order was altogether responsible for the sudden increase, but their exact coincidence is at least significant. The majority of the coal seams in Westphalia have a very high pitch, and one result of spraying was that the surplus water flowed back into the levels, carrying with it in a diluted state portions of any fecal matter with which it came into contact. Dr. Tenholt (the Chief Medical Officer of the Knappschafts-Verein), stated before the Berlin Conference of 1903 his belief that the increase in the number of cases was due to the sprinkling, which diluted and distributed the faces and acted as a vehicle to carry the ova to every part of the mine, besides providing the moisture so necessary for the development of the larva from the egg. Further, the surplus water in many instances drained into a central sump, and was used over again for sprinkling, with the result that the eggs and larvae were distributed broadcast over the mine, thoroughly infecting it in every part.

The oversight and general responsibility for the general health of the miners of Westphalia is vested in the hands of a body known as the Knappschafts-Verein, which is a compulsory provident society under Government supervision. It is supported by contributions from the miners and by grants from the coal operators, and has its own medical officers. At the urgent request of the coal operators, who were justly alarmed at the serious spread of the infection, this body in 1902 appointed a special Commission, who have since been actively engaged in fighting the disease. They formulated rules and inaugurated a vigorous compaign of education and prevention. The use of sump water in sprinkling was forbidden, and arrangements were made for extended medical examinations of the personnel at the infected collieries. Up to the time when the Commission took over the general direction of the measures adopted for the extirpation of the infection, the medical examinations, as before mentioned, had been made on pay days and were very superficial. Such persons as the eye of the doctor picked out as showing anemic symptoms were sent to the hospital for examination and treatment. It began, however, to be realized that this procedure was not sufficiently far-reaching, and that while the distinction between "worm-sick" and "worm-carriers" was absolutely correct from a clinical point of view, the worm-carrier, even though apparently healthy, was a focus of infection, and a menace to the health of those who worked with him. The Board of Mines at Dortmund issued an order calling upon the coal owners to arrange for a miscroscopical examination of the faces of at least 20 per cent. of the underground force, and where infection was known to exist or was revealed by this partial examination the faeces of every person employed underground were to be separately examined. By this means it was hoped to obtain an exact knowledge of the extent of the infection. One of the many difficulties to be overcome was the provision of a sufficient number of examiners, as owing to the similarity between the eggs of the ankylostome and those of other intestinal worms a special training was necessary before the miscroscopists became expert, and it was further found that 50 slides a day was all that one man could examine, owing to the very exacting nature of the work. It is hardly necessary to enlarge on the elaborate organization and apparatus required, and the enormous amount of not over-pleasant work that this task involved, but the results obtained fully justified the undertaking. Official figures, given in "Gluckauf" in November, 1903, showed that out of a total of 188,730 men in the Dortmund district 17,161 or 9.09 per cent. were the victims of ankylostome infection, the percentage of infected men to the total employed underground ranging at different collieries from 2 per cent. to 28 per cent.

In order to afford these men proper treatment portable hospitals were provided by the Knappschafts-Verein at the various collieries. To these hospitals were sent all those men whose dejecta contained worm eggs. They were put through a course of treatment with extract of male fern, and about 97 per cent. have been discharged from the hospital as cured. Before being allowed to resume work underground these men must hold a certificate that they are worm-free, and present themselves for another examination within six weeks. In a

small percentage of the cases treated—1.5 per cent.—the extract of male fern has failed to drive out all the worms, and as further doses might endanger the health of the men they are discharged "uncured," and not being allowed to work underground must find surface employment.

Adequate closet accommodation underground is enjoined by law on all mine owners. The closets are usually iron pails, strongly made with tightly fitting lids, and often fitted with ingenious arrangements to prevent the soiling of the seat. Any man who defecates in the mine and does not use the closet provided, is, if discovered, sent to prison without the option of a fine. The pails are looked after and kept clean by men specially detailed to do this work. In the night time these men collect and load the pails on to special trucks, on which they are despatched to the surface, where the pails are emptied, washed out with hot water, and finally sterilized in a steam cylinder before being sent down below ground again. At some Westphalian collieries the management have provided water closets of a rather elaborate nature on the surface for the use of the employes before descending the mine. This commendable innovation has been found to work satisfactorily in practice, and is becoming more general.

Numerous attempts have been made to disinfect the mines by the use of such substances as lime, carbolic acid, permanganate of potash, sulphuric acid, etc., but without success. The disinfection of a mine whose various roadways total up to perhaps one hundred miles is obviously impracticable, not only on the score of the cost, but because in order to be effective the disinfectant must be applied at least daily. Further, the encapsulated larva is very difficult to kill, and can live for twenty-four hours in a 1 in 500 solution of corrosive sublimate. Those substances would effectively kill the eggs and larvae are mostly inadmissible in the confined airways of a mine on account of their corrosive nature, and their strong odor, and it being finally realized that attempts to disinfect the roadways of a mine were quite fruitless the idea was abandoned entirely, all efforts being concentrated on the prevention of the entrance of new infection.

Thanks to the severe measures adopted and the energy displayed in their promulgation, the Westphalian epidemic has now been got into very manageable limits, and will be steadily stamped out, although it will be probably several years before it can be regarded as extirpated. Probably in no other country could such drastic laws be enforced as were passed in Germany in regard to this disease. Considerable dissatisfaction was aroused among the miners, whose freedom was restricted by the necessary measures taken to limit the infection by preventing men from moving round from one colliery to physically from the disease. The "Kur" was an unanother, who also suffered pecuniarily and not a little pleasant ordeal, and several hot discussions took place between the Social Democratic side of the House and the Government benches with regard to the methods of the doctors and the Knappschafts-Verein. The Government were fortunate in being able to avail themselves of the organization of the Knappschafts-Verein, on whom indeed the bulk of the work fell. The cost of each single cure averaged about 80 marks, and the Knappschaft expended something like three millions of marks. But how effective the measures were may be judged from the fact that the number of worm-carriers has been reduced from 18,000 at the end of 1903 to 2,500 at the beginning of 1905, and it was hoped by the end of 1905 to have reduced the number to nothing. What the actual monetary loss due to the epidemic amounts to it is impossible to say, but when the loss in output of coal and in wages is added to the amount spent on hospitals, relief funds, medical equipment and sanitary arrangements, the total must necessarily be a very large one. The sum of three million marks mentioned as having been spent by the Knappschaft does not include the private outlay of the coal companies, which, in the case of some of the larger concerns, has exceeded a quarter of a million of marks.

Belgium.

Cases of ankylostomiasis were reported in 1884, and in 1885 several men were found to be infected who had worked in the St. Gothard Tunnel. From 1884 to 1898 ninety-two cases were treated in the Liege Hospital. More cases becoming known, steps were taken in 1898 by the president of the Medical Commission at Liege to determine the extent of the infection by a miscroscopical investigation, to decide on preventive measures and to endeavor to educate the workpeople by means of lectures and literature. The Commission immediately ran up against the fact that they had no authority to demand assistance in their work or samples of dejecta for microscopical examination, and in most cases no facilities were extended to them, either by the coal owners or the workpeople. The Commission then issued literature warning the miners against the grave results that followed unsanitary habits underground, and requested that the men should not leave their excretions in the mines, but both their warnings and requests were ignored. In spite of this lack of encouragement, however, the Commission were able to examine 15 per cent. to 20 per cent. of the underground workmen at 72 collieries. Of these collieries 49 were found to be infested and 23 immune. In some of the mines the infection was very severe, going as high as 75 per cent. of the underground force. The Belgian Government have taken practically no action, being afraid of the opposition of the miners and their Socialistic leaders. An attempt to introduce closets underground had to be abandoned in view of the determined resistance of the miners. The subject of ankylostomiasis was discussed at great length by the International Congress of Hygiene, which met at Brussels in 1903, and was attended by the most eminent medical authorities. Resolutions were adopted recommending various compulsory measures, but in view of the apathy of the mine owners and the ignorant opposition of the miners, little had been done at that time in this direction, a state of affairs in marked contrast to the strong action of the responsible authorities in the neighboring coal field of Westphalia.

At the present time, however, a much better condition exists in the Liege Basin, due almost altogether to the labors of the "Dispensaire du Mineurs," an organization that was created in 1903, and, largely under the direction of Dr. Malvoz, has steadily fought ankylostomiasis with gratifying results. The object of the dispensaries was first of all to protect the miner against ankylostomiasis, and for this purpose to educate him and his family in hygienic principles, to assist those who were sick, and to improve the sanitary conditions of the mines. The following table will give some idea of the work undertaken and accomplished by Dr. Malvoz and his colleagues in the last four years.

	1903	1904	1905	1906	Total
Ankylostomiasis treated in the dispensaries.	210	806	1,324	1,573	3,903
Microscopical examinations of dejecta ..	1,570	10,840	21,088	22,188	55,706

The number of "worm-carriers" has also fallen from 27 per cent. in 1902 to 9 per cent. at the end of December, 1906, and it is thought that at the present time not more than 5 per cent. of the underground workers in the Liege Basin are infected.

No man, who under miscroscopital examination of his faeces was found to be a worm-carrier, was allowed to descend the pit until he had undergone successful treatment, and had been proved by at least three microscopical examinations spread over a certain period to be "worm-free." As in Westphalia, it was found necessary to remove from the mines all worm-carriers, who, although they might be in apparently good health, were yet disseminators of infection.

It is interesting to note that these microscopital examinations have proved that miners are particularly affected by intestinal worms, as not only ankylostome eggs, but the ova of oxyuris, ascaris, taenia and other intestinal parasites are found in great variety.

FRANCE.

In the French coal fields the disease has not assumed the aggravated form that it has taken in Westphalia and the Liege Basin, but it has probably been existent in a mild form for a long time. The peculiar anemia which manifested itself in 1802 at the Anzin mines is described in a monograph by Manouvriez, and there can be very little doubt from the exact correspondence of the symptoms that this anemia was due to ankylostomiasis. The rapid extension of the disease in the neighboring countries alarmed the French authorities, and in 1902 an official enquiry was instituted under the direction of Dr. Calmette. The work was divided into two sections, the first comprising the coal fields of the north and Pas-de-Calais, and the second the coal fields in the Loire Basin. At the beginning of 1905 sixty mines had been examined in the first named district, at thirty-two of which infected men were found. The proportion of worm-carriers was 1.8 per cent., 10 per cent. being exceeded in three mines only. The results of the enquiry in the Basin of the Loire are not as yet published, but the infection is more general than in the first district, the mines of which are comparatively cold and dry.

The labors of the two Commissions have met with ready assistance from the coal operators, and it is not probable the infection will be allowed to spread any further; the authorities being fully alive to the gravity of the situation.

(To be Continued)

The Industrial Advocate developes a suggestion made by Mr. A. A. Hayward regarding Government help in exploiting the gold mines of Nova Scotia. The Government's offer of a cash subsidy to encourage the sinking of deep shafts has not had the desired effect. Mr. Hayward has come forward with the proposal that the Government subsidize, not shaft-sinking, but cross-cutting. The idea is particularly applicable to the gold deposits of Nova Scotia. The Local Government may well give it more than "serious consideration."

THE MISCHIEF OF IT.

(LONDON LETTER)

To those engaged in the exploitation of Ontario's mineralized areas, the feeling of London is a matter of concern. Not that the aloofness of the city is irremediable. Not that Throgmorton and Lombard streets are irreconcilable, because of opportunities missed by default. Not that money is unavailable for meritorious ventures. To the contrary, there are funds awaiting supplicants, but in all my experience I have never observed so much indifference; and the cause is attributable to those who erred in their estimates of the extent of public credulity and receptivity.

London is a singular combination of recklessness and reserve. It has paid for its experience at the uttermost ends of the universe when it would have been more profitable to speculate within the colonial circle. Vast sums have been squandered, more have netted returns up to expectations, the reserves of to-day are very great indeed, underwriting and overwriting are as easy of accomplishment as ever; but mining is at a discount. Canada will have to dress its exhibits differently. Instead of printed pictures in the form of script, it is incumbent on all those engaged in developing Northern Ontario fields, to offer something more substantial than hypothetical prospectuses.

It may be somewhat immaterial that existing misconceptions arise out of studied misrepresentations said to emanate from those who would create a bargain counter period for Cobalt properites. This, with ill-advised and unwarranted attempts at promotion, undoubtedly has engendered distrust. None the less has it become urgently necessary for scientific men and technical journals to admonish Toronto miners and embryotic millionairies as to the folly of cheapening their projects, discrediting them in fact, by peddling paper at "job lot prices." Where there is proof of ore reserves or substantial prospects, capital can be provided, and it is the absence of this and the species of rough riding resorted to that causes financiers of the world's metropolis to prefer railroad and government issues, and very often industrial enterprises more risky than mining. Debentures carrying 4½ per cent. and offered at 93 or 94 are regarded with suspicion, while the same at 97 or 98 are absorbed with complacent avidity. Cobalt shares at a premium would require less formal introduction than if they were tendered away below parity, hence you have to reckon with those who malign your mining country and those who choose to discredit what already is discredited by its "clearance sales" prices.

A time will come when London will not be quite so skeptical. How soon will depend upon those who cater for the best buyers, not merely for those who seek a gamble. Unfortunately the fomenting of doubt has placed power in the hands of London journals identified with bucket-shops or worse, and this is a sample of the weekly paragraph of palpable purpose:

"Larder Central Gold Fields.—R. P. E. (Birmingham).—We thank you for the advertisement cutting of this Canadian wild cat from the Birmingham *Daily Mail*. We hope none of our readers will be induced to send money to Messrs. — 'Fiscal Agents—Bank, Toronto.' "

In all directions other than mining Canada's credit is gilt-edged. Cobalt's credit can be equally so—if.

ALEX. GRAY.

THE GENESIS OF THE COPPER DEPOSITS OF YERINGTON, NEVADA.

By E. P. Jennings, Salt Lake City, Utah.

(Toronto Meeting, 1907.)

The Yerington Copper Deposits in Lyon County, Nevada, 40 miles southeast of the famous Comstock Lode, present many interesting features, both from commercial and geological viewpoints.

The Mason Valley Mountains, in which the mines are located, are a small north-south range about 25 miles long and 3 to 6 miles wide, with a maximum elevation of 6,500 feet above sea level and 2,000 feet above the valley of the Walker River.

The core of this range is intrusive granite, exposed in the higher peaks and in the deeper canyons where the erosion has been greatest, but covered by metamorphosed sedimentary strata on both the eastern and western slopes. Late rhyolite flows occur along the eastern base of the mountain.

The intrusive granite is a coarse-grained mixture of feldspar, quartz, hornblende and biotite, becoming porphyritic in structure near the contacts.

Resting on this granite are beds of rock several hundred feet in thickness composed of the lime-alumina garnet, grossularite, graduating into andralite by the partial replacement of the alumina and lime by iron.

A partial analysis gave the folowing results:—

SiO_2	36.2
Fe_2O_3	27.2
Al_2O_3	12.7
CaO	22.7
MgO	.4

This rock varies in texture from a compact mass to a coarse crystalline aggregate of a cinnamon-brown color.

Thick beds of white to gray crystalline limestones cover portions of the garnet rock, but their original area has been greatly reduced by erosion.

An extensive series of metamorphic rocks also occur, whose greatest development is on the west side of the range, where they have a nearly vertical dip and a thickness of 3,000 feet. This series is unconformable with the garnet and limestone on the western slope and separated from them by a fault which has dropped this later series into its present position. These rocks are not as well developed on the eastern side and their relation to the garnet-lime series is obscure.

In composition they range from silicified limes to microscopic aggregates of tremolite, lime-silicates and biotite, and probably were lime shales and slates originally.

The eastern foot hills are covered by late flows of rhyolite that have no connection with the ore deposition.

The structure is complicated by a system of folding and faulting older than the granite intrusion, also by faulting after the mineralization. The effects of this faulting will be considered later.

Copper ore occurs in the garnet rock as an impregnation throughout portions of its mass and as richer concentrations in fractures and shear zones; also as bedded veins in the marbleized limestones.

The effect of the folding and fracturing of the strata previous to the granite intrusion has been to localize, in a degree, the deposition of the ore in the garnet rock along these fracture zones, giving the deposits the appearance of fissure veins filled with chalcopyrite disseminated in a garnet or garnet-epidote gangue, which has a laminated structure parallel to the boundaries of the fractured zone.

On either side of these fissures the garnet rock is more or less impregnated with chalcopyrite, but separated in some cases by a narrow rib of barren epidote 2 to 3 feet thick.

The lower boundary of the ore is the granite, as shown in the Bluestone Mine on the eastern side of the range, where the contact is well exposed; chalcopyrite in a garnet-epidote gangue resting directly on the barren intrusive rock.

The marbleized limestone, which, in places covers the garnet rock, contains bedded veins filled with oxidized copper ore in a quartz and calcite gangue.

At water level, which in one case occurs at a depth of 600 feet, pyrite and chalcopyrite begin to appear, replacing the oxidized ore.

The mines have not been sufficiently developed to show the relation of the ore in the limestone with the ore of the garnet shear zones, but that there is some connection is very probable.

The original minerals of the ore deposits are chalcopyrite and pyrite which have been oxidized and partly leached, forming in the upper enrichment zone, malachite, azurite and chrysocolla, and covellite as a coating, or chalcopyrite in the upper sulphide zone. Bornite and chalcocite occur as secondary sulphides in a few instances.

These ore occurrences can be classed as contact-metamorphic deposits, but differing from the ordinary type in which the ore occurs as iregular masses near the contact; this difference being due to the pre-existing fissures which confined the ore-bearing waters in channels of great vertical extent; aside from these local concentrations the garnet is impregnated with a low grade copper ore.

Where the fisures were more open they were filled by the molten magma, forming dikes of granite-porphyry.

As mentioned before, the mine developments are not of sufficient extent to connect the limestone ore bodies with those contained in the garnet, but it is difficult to avoid the conclusion that in depth the two classes of ore bodies will connect, forming a continuous lode, whose lower boundary is the granite and with its apex in the limestone.

If this view is confirmed by later work, the deposits will be of great interest as illustrating the genesis of ore bodies due to the action of intrusive rock masses, the magmatic waters of which have mineralized certain pre-existing fissures, and, together with the heat derived from the molten magma, have converted certain sedimentary beds into garnet rock containing more or less disseminated ore and other beds, in a higher horizon, into marble, and also filling fractures parallel to the bedding of this marbleized limestone with copper ore.

It is not possible at the present time to determine how much of the rock metamorphism is due to the heating effects of the intrusive and how much to the introduc-

tion of new compounds by the waters of the molten magma, but we can assume that the ore is due to these waters and that the rock metamorphism was largely caused by the action of heat, supplemented by the chemical action of the water, as the garnet is more or less impregnated with ore, showing its permeability to these solutions which undoubtedly contained other mineralizers that contributed to the formation of the garnet.

The limestones, which occur at a higher horizon, have probably been altered by the action of heat alone, as they contain no ore, except in the fissures.

The district is being developed rapidly; one mine having a million tons of ore in sight, and in two years' time it is expected to become a copper producer on a large scale.

THE BRITISH EIGHT-HOUR "BILL"

I.—(1) Subject to the provisions of this Act a workman shall not be below ground in a mine for the purpose of his work and of going to and from his work, or be allowed to be below ground for that purpose, for more than the time fixed by this section during any consecutive twenty-four hours.

(2) The time fixed by this section is, during the period beginning on the *commencement of this Act* and ending on the *thirtieth day of June, nineteen hundred and nine,* nine hours, and thereafter eight hours.

(3) No contravention of the foregoing provisions shall be deemed to take place:—(*a*) In the case of a workman working in a shift, if the period between the times at which the first workman in the shift leaves the surface and the first workman in the shift returns to the surface, and the period between the times at which the last workman in the shift leaves the surface and the last workman in the shift returns to the surface, do not exceed the time fixed by this section; or (*b*) in the case of any workman who is below ground for the purpose of rendering assistance in the event of accident, or for meeting any danger, or for dealing with any emergency or exceptional work which requires to be dealt with without interruption in order to avoid serious interference with ordinary work in the mine.

(4) The owner, agent, or manager of every mine shall fix for each shift of workmen in the mine the time at which the lowering of the men to the mine is to commence and to be completed, and the time at which the raising of the men from the mine is to commence and to be completed, in such a manner that every workman shall have the opportunity of returning to the surface without contravention of the foregoing provisions of this section, and shall post at the pit head a conspicuous notice of the times so fixed, and shall make all arrangements necessary for the observance of those times in lowering and raising the men.

(5) The interval between the times fixed for the commencement and for the completion of the lowering and raising of each shift of workmen to and from the mine shall be such time not exceeding the time reasonably required for the purpose, as may be approved by the inspector.

(6) A repairing shift of workmen may, notwithstanding the provisions of this section, for the purpose of avoiding work on Sunday, commence their period of work on Saturday before twenty-four hours have elapsed since the commencement of their last period of work, so long as at least eight hours have elapsed since the termination thereof.

(7) For the purpose of this Act, the expression "workman" means any person employed in a mine below ground, who is not an official of the mine or a furnace-man, onsetter, horsekeeper, or pumpman; and any body of workmen whose hours for beginning and terminating work in the mine are approximately the same shall be deemed to be a shift of workmen.

II.—(1) The owner, agent, or manager of every mine shall appoint persons to direct at the pit head the lowering and raising of men to and from the mine, and shall cause a register to be kept in the form prescribed by the Secretary of State, and containing the particulars prescribed by him with respect to the times at which men are lowered into and raised from the mine, and the cases in which any man is below ground for more than the time fixed by this Act, and the cause thereof.

(2) The workmen in a mine may, at their own cost, appoint and station one or more persons, whether holding the office of checkweigher or not, to be at the pit head at all times when workmen are to be lowered or raised, for the purpose of observing the times of lowering and raising, and the provisions of the Coal Mines Regulation Acts, 1887 to 1905, relating to the checkweigher, and to the relations of the owner, agent, or manager of the mine to the checkweigher, shall, so far as applicable, apply to any person so appointed as they apply to the checkweigher, with the substitution, as respects appointment, of the workmen in the mine for the persons who under those Acts are entitled to appoint a checkweigher.

(3) If any person makes a false entry in the register which is to be kept under this section, or causes or permits any such false entry to be made, he shall be liable on summary conviction in respect of each offence to a fine not exceeding five pounds.

III.—(1) The time fixed by this Act as the time during which the workmen in a mine may be below ground for the purpose of their work and of going to and from their work may be extended as respects any mine by the owner, agent, or manager of the mine, on not more than sixty days in any calendar year by not more than one hour a day, and on any day on which an extension of time is made in accordance with this section as respects any mine, the time as so extended shall be substituted for the purposes of this Act as respects that mine for the time as fixed by this Act.

(2) The owner, agent, or manager of every mine shall cause a register to be kept in such manner as the Secretary of State may direct of the cases in which any extension of time has been given under this section, and the register shall be open to inspection by the inspector.

IV. His Majesty may, in the event of war or of imminent national danger or great emergency, or in the event of any grave economic disturbance due to the demand for coal exceeding the supply available at the time, by Order in Council suspend the operation of this Act to such extent and for such period as may be named in the Order, either as respects all coal mines or any class of coal mines.

V. In the application of this Act to mines which are entered otherwise than by a shaft, and to workmen who are not lowered to or raised from the mine by means of machinery, the admission of men to the mine shall be substituted for the lowering of men to the mine, and the return of men from the mine shall be substituted for the raising of men from the mine, and such times as may be determined by the owner, agent, or manager of the mine, with the approval of the inspector, as the times properly corresponding to the times fixed for the commencement and completion of the lowering

and raising of workmen to and from the mine, shall be substituted for the times so fixed.

VI.—(1) If any person contravenes or fails to comply with or permits any person to contravene or fail to comply with any provision of this Act for which a special penalty is not provided, he shall be guilty of an offence against this Act, and in the event of such contravention or non-compliance by any person whomsoever, the owner, agent, or manager of the mine shall each be guilty of an offence under this Act. Provided that:—(*a*) In the event of any such contravention of or non-compliance on the part of a workman, the owner, agent, or manager of the mine shall not be guilty of an offence if he proves that he has taken all reasonable means to prevent the contravention or non-compliance; and (*b*) a workman shall not be guilty of an offence under this Act in the case of any failure to return to the surface within the time limited by this Act if he proves that without default on his part he was prevented from returning to the surface owing to means not being available for the purpose.

(2) A person guilty of an offence under this Act shall in respect of each offence be liable, on summary conviction, if he is the owner, agent, or manager of the mine, to a fine not exceeding two pounds, and in any other case to a fine not exceeding ten shillings.

(3) If a workman is below ground for a longer period during any consecutive twenty-four hours than the time fixed by this Act he shall be deemed to have been below ground in contravention of this Act unless the contrary is proved.

VII.—(1) This Act shall, except where the contrary intention appears, apply to all mines to which the Coal Mines Regulation Acts, 1887 to 1905, apply.

(2) This Act shall come into operation on the *first day of January, nineteen hundred and eight.*

(3) This Act may be cited as the Coal Mines Regulation Act, 1907, and shall be construed as one with the Coal Mines Regulation Acts, 1887 to 1905, and this Act and those Acts may be cited together as the Coal Mines Regulation Acts, 1887 to 1907.

NEW DEPARTMENT OF MINES.

Dr. Haanel's appointment to the Directorship.

By H. Mortimer-Lamb.

Brief reference was recently made in these columns to the Act of Parliament creating a Federal Department of Mines, under the direction of the Hon. Wm. Templeman as Minister, a gentleman who is keenly alive to the requirements of the industry. The establishment of this department, the need of which had for some years past been repeatedly brought to the attention of Government, is a matter for much congratulation, and the satisfaction generally expressed that the step has at length been taken is not less enthusiastic by reason of the fact that the actual administrative and executive work of the Department has been entrusted to men of exceptional ability and experience.

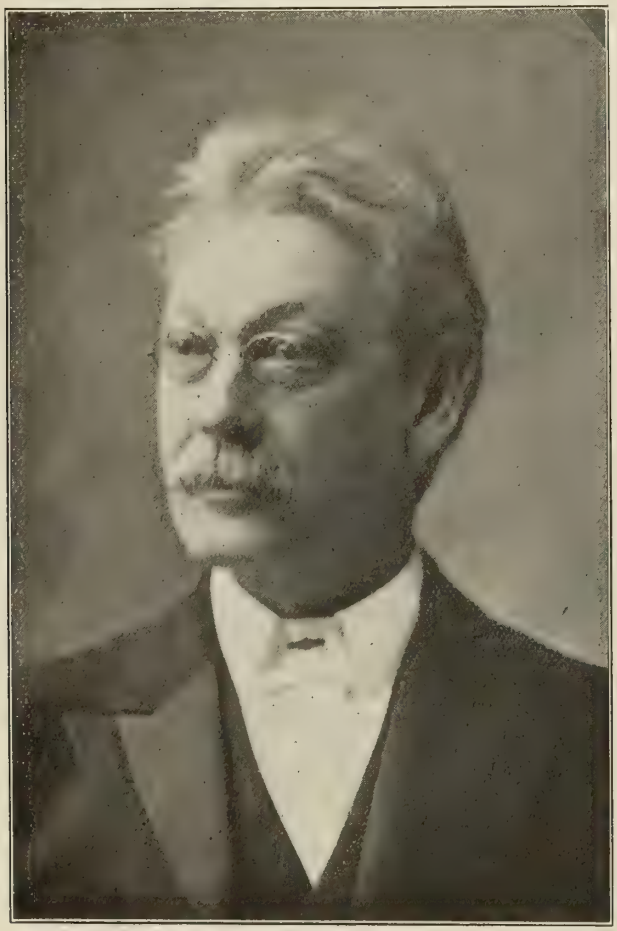
The qualities that eminently entitled Mr. A. P. Low to his appointment to the head of the Survey will serve him in equal stead in the performance of his new and more responsible duties as Deputy Minister. In this work, however, he will have the advantage of the strong support of a gentleman who for the past six years has not only made a special study of the development of methods for promoting the interests of mining in the Dominion, but during his tenure of office as Dominion Superintendent of Mines has already, by the economic value of the reports issued under his instruction and the importance of the research work in electro-metallurgy which he has inaugurated, done great service for the mineral industry of Canada. We refer, of course, to Dr. Eugene Haanel, whose appointment to the Directorship of Mines we chronicled recently.

Dr. Haanel was born in Breslau, the capital of Silesia, Germany, on May 24th, 1841, in which centre he received his early education, graduating from the Gymnasium, in the classical course in 1858. Shortly afterwards he paid his first visit to the United States. He saw service in the Civil War, of which he was a veteran, and after was elected to the Chair of Modern Languages in Adrian College at Adrian, Michigan. Subsequently he taught modern languages and philosophy at Hillsdale College.

In 1867, Dr. Haanel was elected Professor of Natural Sciences in Albion College. During his residence at this institution, a period of four years, he labored with characteristic energy and zeal for the improvement of his department of the University, with the result that before he left it had become the largest and most adequately equipped of the institution. While at Albion he received the degree of Master of Arts from Ohio University.

At the close of his fourth year at Albion Dr. Haanel finding his health very much impaired from over work returned to Germany, where he graduated from Breslau University as Doctor of Philosophy, with the degree "magna cum laude" in the following subjects: Geology, Mineralogy, Chemistry and Physics.

Immediately upon the completion of his university course, Dr. Haanel returned to America and joined the staff of Victoria University, Cobourg, Ontario, as Professor of Natural Sciences, and lecturing for the first six years on the subjects of Geology, Mineralogy, Chemistry and Physics, after which on the appointment of one of his students, Dr. A. P. Coleman, to the Chair of Geology in Victoria University, he confined his attention to Mineralogy and Physics only. Later he was appointed Dean of the Science Department and Director of Faraday Hall, the first Science Hall in Canada, the erection of which was carried on under Dr. Haanel's supervision and direction.



During the term of his professorship at Victoria University, Dr. Haanel found time to undertake some original research work in connection with blowpipe analysis, his results being printed in a series of papers entitled, "Hydriodic Acid as a Blow Pipe Reagent and Gypsum Tablets as a Support Superior to Charcoal," and published in the Transactions of the Royal Society of Canada, of which he was a charter member.

In 1888 Dr. Haanel was invited to accept the Chair of Physics in Syracuse University, and upon the removal of Victoria University to Toronto, accepted the

invitation in preference to a Professorship at Toronto University proffered at the same time. When he assumed his duties at this University, however, he found the equipment of the Department very inadequate, but ultimately with his aid it came to rank in this respect with the best provided institutions in the country.

In 1901 Dr. Haanel resigned his Professorship to accept the appointment of Superintendent of Mines for Canada, offered him by the Hon. Clifford Sifton, then Minister of the Interior, and also, by the way, a former student under Dr. Haanel.

Few men have won such regard and esteem from their associates as has the new Director of Mines. Thus on the subject of his Canadian appointment, the Syra-

Dr. Eugene Haanel.

cuse *Post-Standard* remarks in a leading article: "In choosing a scientist as Superintendent of Mines of the Dominion of Canada, no man more worthy from past record and present ability could have been selected. . . . In a tribute paid Dr. Haanel upon the conclusion of fourteen years of service as a Professor in Victoria University some years ago it was said that probably no other person had done so much to give science its due importance in the university education of Canada as this man. He entered Syracuse University twelve years ago when the Department of Physics was small and poorly equipped; he will leave the University in possession of one of the finest and most complete departments that can be found in any educational institution in the country." And the Chancellor of the University wrote: "I congratulate you and I congratulate the Government of Canada upon securing a man so eminent among scholars, so thoroughly filled with science and dominated by its genius and, who . . . adds to his scientific knowledge, acquaintance with mechanical arts and with affairs, an acquisition indispensable to the important office to which you have been appointed."

Upon coming to Canada Dr. Haanel proceeded at once to initiate a work of importance. The Klondike excitement was then in full swing and our energetic neighbors to the south were putting forth every effort to secure the bulk of the trade resulting therefrom. And they were succeeding largely by reason of the fact that there was a United States assay office at Seattle, where without any difficulty or trouble the miner might take his gold and convert it into currency without being heavily mulcted in charges. Hence the Superintendent of Mines established a Government Assay Office in Vancouver, and also arranged with the provincial authorities for like facilities at the capital, and in consequence the stream of gold was considerably diverted into Canadian channels.

His next important work was the production of the monograph "On the Location and Examination of Magnetic Ore Deposits by Magneto-metric Measurements." This method of locating magnetic ore bodies has been most successfully adopted in Sweden and it should prove of extraordinary value and utility in this country where the conditions are not dissimilar. We understand, meanwhile, that the instruments will be largely used for determining the extent of ore bodies by the engineers to whom has been entrusted the task of reporting for the Department on the iron resources of the Dominion.

Possibly, however, Dr. Haanel's greatest achievement from an economic standpoint is the work resulting from his investigations of the application of electro-thermic processes for the smelting of iron ores and steel as applied to conditions existing in Canada. In 1903 he was appointed Chairman of a Commission which went to Europe to enquire into the different processes in use there. A full and most valuable report giving the result of these investigations was published the following year and attracted widespread interest and attention, while later the Government authorized the setting up of an experimental plant at Sault Ste. Marie, where a series of very successful tests was carried out under the direction of Dr. Haanel in the autumn and winter of 1906, the results being published in the report recently issued. The future will determine the commercial potentialities of electric smelting in Canada, but in the opinion of many competent to express an opinion it will ultimately revolutionize existing methods and be the means of turning to profitable account the large iron resources of Ontario and Central Canada, which are now to all intents and purposes lying idle.

Among other important publications issued from the Superintendent of Mines' office may be mentioned, a report on "The Mining Conditions in the Yukon Territory" (1902); a report on the "Shales and Clays of Manitoba," and "Monographs on Mica and Asbestos," and the valuable report of the commission last year on zinc in British Columbia.

The programme for this year's work in connection with the new Department of Mines is of a very comprehensive nature and will include a Monograph on Canadian Graphite, a report on the Peat Industry of Europe with a view to affording information to Canadian producers; a report on Iron Ocurrences in Eastern Canada, and last, but not least, a manual of general information covering the field of mining endeavor in the Dominion and containing a directory of mining companies operating properties, descriptions of mining

and metallurgical plants and statistics of production and other useful data.

Dr. Haanel is a member of the following institutions: Physical Society, Canadian Royal Society, Canadian Mining Institute, Faraday Society, and North of England Institute of Mining and Mechanical Engineers.

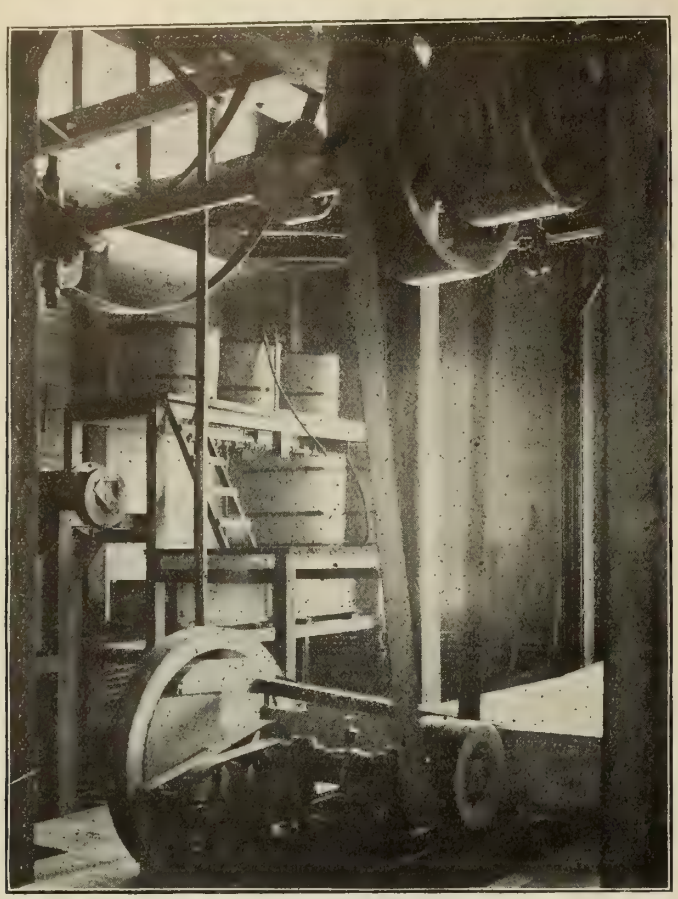
It may be safely said, in conclusion, that under the direction of such men as Mr. A. P. Low and Dr. Haanel, the new Mines Department will speedily become of the greatest possible value to the industry. Since the Act passed there has ceased to be a danger, at one time imminent, of the duplication of effort arising from two departments of the Civil Service under dis-associated heads engaging in duties of a very similar nature and practically working to the same end. Meanwhile the office of the Mines' Department has been moved to the Thistle Building in Ottawa, pending the completion of the new Government buildings in which permanent quarters will be established. The original plans for this building were drawn by Dr. Haanel, but subsequently changed by the architect to conform with other requirements, such as space for the museum and National Picture Gallery. It is proposed nevertheless to devote ample room in the building for laboratory purposes, and suitable equipment is also to be provided for carrying on metallurgical tests and experiments on a considerable scale.

THE MINING AND METALLURGICAL LABORATORY

School of Mining, Kingston, Ontario.

G. J. McKay.

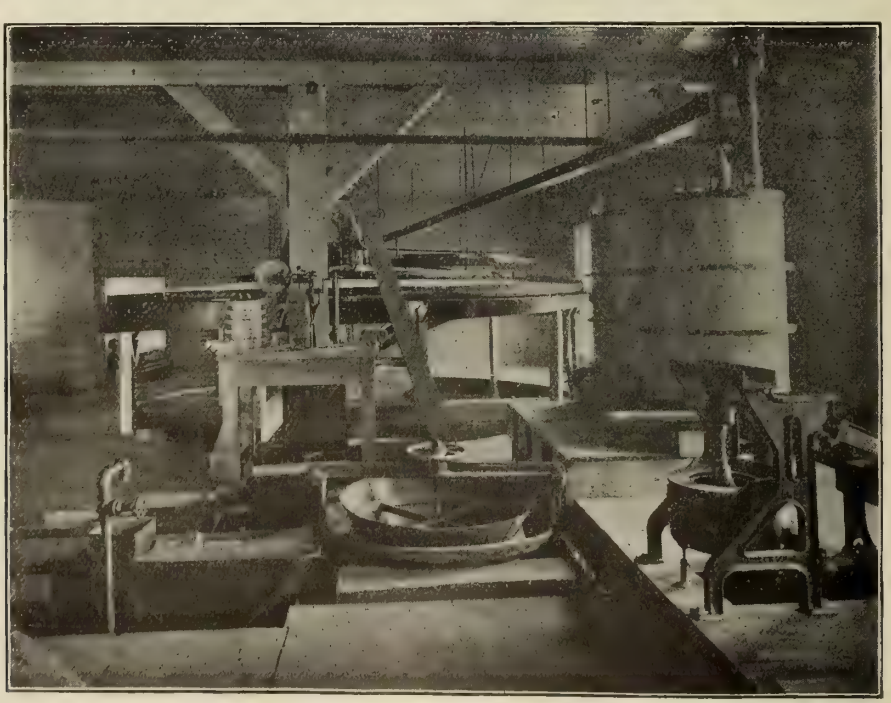
The School of Mining is a College of Applied Science and is affiliated with Queen's University, which confers the degrees on the graduates. Courses are given in Mining, Civil, Electrical, Mechanical and Sanitary Engineering, and in Geology, Minerology and Chemistry. Each course covers a period of four sessions.



Mining Laboratory, Kingston School of Mining.

The oldest and best developed course in the School is that in Mining and Metallurgy. This department is under the direction of Prof. J. C. Gwillim, M.E., and Prof. S. F. Kirkpatrick, M.Sc., both graduate of McGill University, and men of wide experience in their respective departments.

The part of the School that is of most interest to mining men is the Mining and Metallurgy Laboratory. Visitors are surprised to see the amount of machinery and apparatus that is in use in this building. The milling and concentrating machinery is of the most approved pattern. A complete assay and chemical laboratory occupies part of the building, and is used in connection with the mill work only. Fourth year students in Mining and Metallurgy receive their practical training here.



They are given practice in the treatment of gold and silver ores by stamp milling and amalgamation, cyaniding and chlorination; and the concentration of ores by the jig, the Frue Vanner, the Wilfley table, the slime table, and the magnetic separator.

During each session, up to the Christmas vacation, the work is confined to the treatment of gold and silver ores. The whole of each Friday and the morning of each Saturday are given up to this work entirely. Crushing, sizing, sampling and assaying are first practiced.

Wilfley Table and Cyanide Plant—Mining Laboratory.

A Blake crusher, a pair of rolls, a Krupp ball mill, a tube mill and a cone grinder are used for crushing and pulverizing the ores. Then mill runs are made on quantities of ore of a ton or more, and saving is made by amalgamation and by concentration of tailings on the Wilfley table, the tailings being caught and the slimes settled in spitzkasten and slime boxes. The concentrates are treated by different processes to find the best method of recovering the values, and the tailings and slimes are treated by chlorination or cyaniding. All this work is

Classifiers and Slime Table—Mining Laboratory.

checked by assays, and thorough laboratory cyaniding and chlorination tests always precede the treatment of tailings and slimes.

The plant for the gold and silver runs consists of a five stamp battery of 850 pound stamps, with mortar and apron amalgamation plates, a Wilfley table, a Frue Vanner, a Spitzkasten, slime boxes, a silver amalgamation pan and settler, and a complete cyaniding outfit. During last session two mill runs of Larder Lake ore were made, and a ton of refractory Temagami ore was treated.

The work during the last half of the session is confined to the concentration of different kinds of ore on the jigs, Wilfley table, Frue Vanner, etc. Last session quartz-copper ores, zinc-lead ores and magnetic iron ores were experimented with. Assays were made to find what size and what method of treatment gave the best results in each case. For large runs, besides the concentrates already mentioned, a Colorado Iron Works classifier, an Evans jig and a Hartz jig are used.

In the Metallurgical department complete analyses of smelting ores are made, charges are calculated, and small furnace runs are put through. For this purpose there is a small blast furnace and two reverboratory furnaces.

A steam engine is employed to operate the heavier machinery, while the lighter are driven by electric motors. Power is obtained from the central heating and lighting plant of the University.

As there is no customs ore testing plant in the Province capable of handling large quantities, it was decided to keep the laboratory open throughout the summer. It was believed that this would fill a long-felt want in Eastern Canada. The work is under the direction of Prof. S. F. Kirkpatrick, and a graduate of the School has been engaged as assistant.

The following classes of work are undertaken: Stamp mill amalgamation, followed by concentration; preliminary cyanide tests of small quantities of ore, concentrates, and tailings; complete cyanide reports on the availability of that process for treating the product; concentration tests by one or more methods on lead and copper ores; crushing and sampling large quantities of ore to insure accurate sample for assay; complete analyses and reports on the smelting qualities of ores, etc.

Persons contemplating erecting a plant to handle any kind of ore might find it profitable to have preliminary tests made at such a laboratory in order to know what kind of treatment was best suited to their ore. Owners of gold properties would receive more definite and satisfactory information from the treatment and actual bullion returns of a ton or more of their ore than they could obtain from any number of assays.

OBITUARY

The death occurred at Halifax on the 28th ultimo, of Mr. T. R. Gue, president of the Acadia Power Company, and of the Dominion Electrical Works. Mr. Gue was a native of the State of New York, but came to Canada some thirty years ago and was appointed secretary of the Hamilton Powder Company in Montreal. He has resided in Halifax for the past eight years. Mr. Gue had a wide circle of friends and acquaintances in the Province of Quebec and in the Maritime Provinces, and he was universally liked and respected. He was one of the oldest members of the Canadian Mining Institute.

PLATINUM IN NEW ZEALAND

In view of the falling off in the supply of platinum from Russia, the chief source of production, and the steadily increasing demand for the metal, the report, recorded in Bulletin No. 1 of the New Zealand Geological Survey, that platinum has been discovered in the Hokitika district of that colony, is of possible economic interest. Further, the manner in which the mineral occurs, in quartz veins close to the Pounamu belt of magnesian eruptive rocks, is of considerable scientific interest, as apart from the fact that platinum is not frequently found *in situ*, when found in its native zones in New Zealand it usually occurs actually in the magnesian eruptive rocks.

The only recorded occurrence of platinum in New Zealand was observed by Mr. T. A. Pond (*Trans. New Zealand Inst.*, 1882), who stated that gold, silver, platinum and iridium was found in quartz obtained from a depth of from 540 to 600 feet in the Queen of Beauty shaft at Thames, Eew Yealand.

Platinum has been found in the present instance in the two veins where in the most important of which the white semi-vitreous platiniferous quartz occurs in lenticular seams intercalated with the country rock, which consist of a dark shaley phyllite. Assays of two samples of this quartz yielded the follows results:

1—Platinum, 3 dwts., 8 grs.; ag., 1 oz., 4 dwts., 9 grs.
2—Platinum, 1 dwt., 2 grs.; ag., 7 dwts., 13 grs.

In the second locality the platinum occurs in a bedded quartz vein, which attains a maximum width of about a foot, and is enclosed in banded schists. The vein contains a small proportion of pyrite and chalcopyrite.

The physical condition of the metals in the above samples has not yet been determined, but it is to be noted that in each case the silver accompanies the platinum in the ratio of 7 to 1, suggesting a combination of the two metals.

Platinum has been found in place in Canada, but except in the case of the Sudbury sperrylite, and which in limited quantities is recovered and marketed as a by-product from the nickel-copper ores, the deposits containing the mineral have not been turned to commercial account. At another locality in Ontario, near Wabigoon, Rainy River, platinum was reported to have been found two or three years ago in some of the eruptive rocks there.

In British Columbia, from the Similkameen, sent for analysis to Messrs. Baker & Company, of Newark, N.J., returned very satisfactory platinum values, although it is understood the Provincial Assayer of British Columbia failed to obtain results. Prof. Kemp, however, found traces of platinum in the granite, more or less decomposed, on Siwash Creek, a tributary of the Tulameen. From the evidence, it seems clear that platinum is not confined to the basic eruptions. This is pointed out by Dr. C. W. Dickson, who has especially investigated the subject.

In this issue our representative in the West summarizes the car shortage situation. Allusion is made to the failure of the C. P. R. to live up to its promises. Our correspondents' facts are incontrovertible. We are glad to be able to publish the clear, straightforward statement of an actual observer. Upon the various phases of fuel transportation in the West we shall have more to say presently.

TINSTONE IN NORTHERN NIGERIA

In the last number of the Bulletin of the Imperial Institute a brief description appears of the alluvial tinstone deposits of Northern Nigeria. The deposits occur in the south-west part of the province of Bauchi, near the river Delime, which flows north-east towards Lake Tchad. The tin-bearing alluvium, as far as is known, is restricted to the plateaux of Tilde, Rukuba, Jos and Ngell. The rocks of the Tilde and Rukuba plateaux consist of soft felspathic gneisses which are often garnetiferous, and are cut by veins of muscovite-pegmatite. Dykes of basalt and dolerite are also of frequent occurrence. The rock composing the plateaux of Jos and Ngell is a reddish biotite-granite, passing into a quartz-porphery on the margin.

Although tinstone has hitherto been found only in the gravels, lumps of tinstone, more or less angular in shape and having a granitic matrix, have been discovered in the neighborhood of Jos. This has led to the supposition that the tinstone is probably disseminated in the red granites, with lodes in the neighborhood of the coarse material.

The tinstone is very irregularly distributed in the gravel, the yield in adjoining pits varying from 10 lbs. or less, up to 100 lbs. per ton. Metallic tin is frequently found in small quantities in the sands and gravels of the river Delime. It probably represents material smelted by the natives and subsequently thrown into the gravel with rejected slags.

The "black tin" obtained by washing the gravels is seldom pure tinstone. A separation made by an electromagnet gave the following results:

Ilmenite,. garnet, about 20 per cent.

Monazite, about 5 per cent.

Tinstone with some zircon, rutile, quartz, about 74 per cent.

The Niger Company in 1905 applied for mining licenses in certain selected areas with a staff of four Europeans, and some 200 native laborers, and large stores, offices and native houses constantly employed; they are now steadily progressing. The fuel used is entirely wood charcoal.

BOOK REVIEWS

The Copper Mines of the World, by Walter Harvey Weed, illustrated, New York and London, Hill Publishing Company, 1907, pp. 375, 9 inches by 6 inches. Price $4.00 postpaid.

In this volume the author has carefully and thoroughly, presented a bird's eye view of the salient features of the geology of the principal copper deposits of the world, and has then added descriptions of the principal copper mines of the world. A series of maps gives a clear idea of the actual location of each of the more important copper districts in the old and new worlds. The mineralogy and geology of copper are discussed in separate chapters in a manner succinct and satisfactory. Cross-sections and plans of leading mines in Europe, Africa, Australia and America, illustrate successive chapters. The book is most evidently the result of a very large amount of discriminating labor and careful editing. The volume is a much needed addition to the literature of copper.

The Mineral Industry—its statistics, technology, and trade during 1906—edited by Walter Renton Ingalls, volume XV. Hill Publishing Company, 505 Pearl street, New York, pp. 954, 9 inches by 6 inches.

The annual volume of "The Mineral Industry" is too well known to require any introduction to the mining public. Summarizing as it does the whole growth and condition of mineral production in the United States, its value as a work of reference cannot be overestimated. The contributors to the volume are men of the highest rank. Each important mineral and metal is dealt with by a specialist. The world's mineral production is tabulated. Most interesting of all the sections is that on the progress in ore dressing and coal washing in 1906. Robert H. Richards and Charles E. Locke are responsible for this contribution. As a resume of the latest developments in these two important subjects it is invaluable. It contains among other subjects a digest of ball and tube mill practice. No mining man should neglect securing one of these volumes. It is most obviously a necessity.

The Canadian Annual Review of Public Affairs, 1906, by J. Castell Hopkins, The Annual Review Publishing Company, Toronto, Ont., pp. 659, 8½ inches by 6 inches.

In thirty-two pages of this bulky volume the progress and conditions of mining in Canada during 1906 are traced. In all the Review is a well designed record of Canadian public growth. It is clearly printed and fully illustrated.

Public Roads, Their Improvement and Maintainence, by E. R. Buckley, Ph.D., Director and State Geologist, Missouri Bureau of Geology and Mines.

The subject of good public and private roads is one of prime importance to the Canadian mine-operator. In many districts corduroy roads are the only highways available for the transportation of heavy freight to isolated mines. Every bad road implies loss of energy and waste of material, time and money. There is crying need of road improvement in New Ontario. In Nova Scotia lack of cheap transportation has closed down or prevented the development of a number of otherwise workable mines. This official publication is a practical and exhaustive treatment of the subject and will make good reading for our road-makers.

Dredging for Gold in California, by D'Arcy Weatherbe. First edition. The Mining and Scientific Press,, San Francisco, 1907, pp. 217, 8⅞ inches by 6 inches, 106 illustrations. Price $4.00.

Introductorily the author acknowledges the suggestions and help of many writers, operators and others, who have put material at his disposal. Owing to Mr. Weatherbe's absence in South America, Mr. T. A. Rickard edited the book. The result is a clear, attractive and creditable volume.

In arrangement a logical sequence is followed. The order of subjects is: 1st, Prospecting dredging ground. 2nd, Dredging machines. 3rd, Operation. 4th, The metallurgy of dredging. 5th, Costs. 6th, The horticultural question. 7th, General. The volume closes with a series of contributions and discussions by J. H. Curle, G. L. Holmes, T. A. Rickard and C. W. Purington.

The subject of gold dredging is one which is daily growing in importance. In the Yukon and British Columbia and in the new provinces large fields await the pioneer. Mr. Weatherbe's book is thus timely. Moreover the average mining man is singularly ignorant of both the possibilities and limitations of this branch of gold winning. The volume should prove a source of help to operators and a very valuable addition to every mining engineer's library.

Senator Jaffray and other members of the Board of the Crow's Nest Pass Coal Company, left Toronto towards the close of July on a visit of inspection of the company's collieries at Fernie, B.C.

EXCHANGES

The Mining Journal, August 3, continues its series of papers on "The Systematic Treatment of Metalliferous Waste."

The Iron and Coal Trades Review, August 9, opens with a paper on "The methods adopted in the Hungarian Government steel works for avoiding piping in steel ingots." Interesting data are given as to the use of Thermit.

In the Mining World, August 17, Woolsey McA. Johnson describes the Kelly mine, New Mexico, and treatment of its ores. The zinc carbonates of this camp carry only one-tenth of one per cent, sulphur, and no silicate of zinc. The silica in the carbonate is combined

The Engineering and Mining Journal, August 17, opens with, "The Nomenclature of Modern Placer Mining," by J. P. Hutchins. The Briton Ferry Works of the Cape Copper Company, South Wales, is described in another article by Edward Walker. It is here that

An illustrated article on "Pioche, Nevada," appears in the Mining and Scientific Press, August 10. Pioche, a mining camp of Eastern Nevada, flourished and prospered in the early seventeies. It fell upon evil days after 1875. Now it is to be connected with the rest of world by railroad. Large bodies of low grade ore, commercially valueless under the conditions of thirty years ago, will be opened up.

the Tilt Cove ores are smelted.

The Journal of the Chemical, Metallurgical and Mining Society of South Africa, June, has a practical and suggestive paper on "The Utilization of Waste Heat in Slimes Settlement," by A. Salkinson. By the use of exhaust steam and pump, Mr. Salkinson effected a increase of capacity of 20 per cent. in his cyanide plant and brought his extraction up from 91.192 per cent. to 92.887 per cent.

Economic Geology for June begins with "Concentration of Gold in the Klondike," by J. B. Tyrrell. Referring to the quantity of rock washed down by eroding and transporting agencies, Mr. Tyrrell computes the time necessary for the removal of 900 feet of surface, as approximately 3,600,000 years. "A thickness of 900 feet over an area of 800 square miles would equal a mass of 136 cubic miles or 1,600,000,000,000 tons of rock This is therefore the quantity of rock that was removed by denudation, and from which 10,000,000 ounces of gold was washed and concentrated into the Klondike placers, and it represents an average gold content of 0.003 grains or 0.013 cents to the ton of the original rock in place. It is thus seen that the Klondike district owes its phenomenally rich placers not to the wearing down of highly mineralized gold-bearing veins or lodes, but rather to the favorable conditions of long continued and uninterrupted concentration from a great mass of rock that contained only very minute quantities of gold."

The second artilce in Economic Geology for June is entitled, "On the Microstructure of Nickeliferous Pyrrhotites." The authors are Prof. W. Campbell, of Columbia, and Mr. C. W. Knight, asssistant geologist of Ontario. In this metallographic examination of nickel ores from widely separated localities, many points of similarity were found. Pyrrhotite, pentlandite and chalcopyrite were found to compose the ore, having a sequence of origin in the above order. The two last named sulphides are closely associated and have a habit in common. All of the ore bodies are associated with basic eruptives. The writers do not favor the theory of magmatic segregation.

Three excellent papers are contained in Mines and Minerals for August. "Notes on Hydraulic Mining," with special reference to the Cariboo District, B.C., and Yukon Territory. In the course of the paper the impression that the Cariboo working season is limited to a few months is corrected. Actual washing operations are carried on for about 200 days each year. Prof. F. W. Traphagen writes on "The Treatment of Zinc Ores." He notes that the use of oil concentartion has not been applied on a commercial scale in the State of Colorado. Briefly the ore is roasted with some coal admixed, zinc is reduced, volatilized, again oxidized and together with the lead sulphate formed at the same time, carried to the bag-house. The cinder from the "roasters," ore from various sources, limestones for flux and the necessary fuel, are smelted in a low-column blast furnace operating with a hot top.

"Colliery Warnings" is the title of a leading article in the Colliery Guardian, August 9. The writer carefully sums up various opinions regarding the relation of barometric movements to colliery disasters. He advises the adoption of a system of warnings of the approach of cyclonic disturbances, which are known to travel in a definite path and with a definite velocity. "Forewarned of the probable track of one of these atmospheric eddies, collieries lying in or near its path would be in a position to adopt precautionary measures." It is mentioned that both England and America make very little use of the aid of the modern science of weather forecasts, despite the general admission by mining engineers that atmospheric influences are certainly capable of setting up in a mine a state of things, which, even if it does not produce an explosion, is favorable to the establishment of critical conditions.

PERSONAL AND GENERAL

Mr. Gallagher, of the Hamilton Power Company, at present convalescing in Tadousac, Que., will soon return to his post. He is already much improved in health.

Mr. Hugo Kellegren, of Clarkson, Wash., one of the directors of the Washington, Idaho & Oregon Reduction Co., controlling the patents in Montana, Washington and Idaho, for a new method of ore reduction, is visiting Rossland and inspecting the smelting works of the district.

At a periodical clean-up of one of the dredges operating in the Yukon the following strange collection of articles was found in the sluice box: Two Russian bronze icons; eight American pennies; 100 pounds of unexploded cartridges: 120 pounds of nails: an alarm clock; a saw set; two Masonic charms; an opal scarf pin; knives, forks, keys, locks, native bismuth, cassiterites, stanites, magnetic octohedrons, bushels of black sand and several nuggets worth over $10 each. The last item caused some surprise, as it had been generally supposed that the gold in this particular basin was of fine quality.

The manufacture of Portland cement is becoming a very important industry in the Province of Alberta, where the demand considerably exceeds the supply. In consequence the capacity of existing plants is being largely increased, while other factories are in course of erection. One of the largest of these is a new factory at Exshaw, which, it is said, will be the most completely equipped plant in America; while the supply of raw material in the vicinity is practically inexhaustible.

Mr. J. A. Whittier, manager of the Goodenough mines, Sandon, B.C., has returned home after wintering in California.

Mr. J. E. McAllister, general manager of the B. C. Copper Co. has returned to Greenwood form a visit to Eastern Canada.

Mr. A. P. Low, Deputy Minister of Mines, left Ottawa on the 8th inst. for the West, where he will visit the several mining districts of Alberta and British Columbia.

Mr. E. Brydon-Jack, until recently professor of civil engineering at Dalhouise University, Halifax, N.S., has accepted the chair of Civil Engineering at the University of Manitoba, Winnipeg.

Some important new discoveries of coal are reported to have been made in the Eagle Lake district of Alberta, and the Provincial Inspector, Mr. Frank B. Smith, is now engaged in making an examination of the area.

Mr. R. W. Brock, after reporting on the Larder Lake District for the Ontario Government, has returned to British Columbia to continue work for the Geological Survey of Canada in the Lardeau and Rossland districts.

In a recent interview, Mr. M. M. Johnson, chief engineer of the Dominion Copper Co., is reported to have stated that the best average costs at the Boundary Falls plant for a month's run was $1.51. This is higher than other averages in the district, but Mr. Johnson stated that Dominion costs are by no means yet down to a minimum.

Mr. G. L. Holmes, of San Francisco, contributes an interesting letter which appears in the *Engineering and Mining Journal* of August 10th, on the subject of "Platinum in the Yukon." The writer suggests that the reported discovery of platinum bearing sands on the Hootalinqua river, should be received with the utmost caution, since the investigations carried out by himself and another mining engineer in 1900 in the locality mentioned, proved practically resultless. The company Mr. Roberts represented held a lease on a tract 80 to 85 miles above the mouth of the river, and prospecting was carried on at every bar for about ten miles below the last camp. The samples obtained all contained traces of gold, but none of them showed platinum. The greatest amount of back sand found in any one place was about half an ounce in twenty pounds of original gravel, which would signify that at least 300 lbs. of gravel would be required to yield 15 oz. of black sand. This last statement is made to controvert the report that 15 oz. of black sand from 200 lbs. of gravel had yielded 0.7 grams of platinum.

It is satisfactory to note that immediate steps are to be taken for the establishment of a mining engineering college, to be in large measure associated with McGill University. Thus at a recent meting at Vancouver of members of the Roval Institution for the Advancement of Learning, it was announced that a lease for a site had been obtained from the Government and that a building would be erected thereon to cost in the neighborhood of $100,000. Already endowments have been provided for four chairs, namely a Chair of Mining and Chemistry by the Hon. James Dunsmuir, Lieutenant-Governor of British Columbia; a Chair of Civil Engineering endowed by Mr. A. C. Flumerfelt, a director of the Granby and of the International Coal Companies; a Chair of Pure and Apllied Mathematics, endowed by Mr. F. Carter-Cotton, editor of the Vancouver *News-Advertiser*, and a Chair of Modern Languages, endowed by McGill University graduates resident in British Columbia. A summer school for instruction in the field is also to be established in one of the mining districts of the province.

Mr. S. S. Raymond, general manager of the Brittannia Smelting Co., Crofton, B.C., is visiting the Coast on a tour of inspection.

Mr. R. H. Stewart, manager of the War Eagle and Centre Star mines at Rossland, B.C., is spending a month's holiday in Ottawa.

Mr. A. B. W. Hodges, local manager of the Granby Consolidated M. & S. Co., has been spending a brief holiday at Hayden Lake.

Mr. T. R. Weeks, for three years Messrs. Guggenheims' mining engineer, recently inspected the Hanson Consolidated silver mines at Cobalt.

Mr. Montague Davys, a resident in the Kootenays of nineteen years' standing, where also he has large mining interests, is leaving Nelson shortly to reside in England.

Mr. H. Mortimer-Lamb, secretary of the Canadian Mining Institute, left Montreal on the 20th inst., for the west, where he expects to spend six weeks visiting the mining sections of Alberta and British Columbia.

For the fiscal year ending June 30th, Kootenay lead production, on which, subject to conditions, a bounty is paid by the Dominion Government, was 23,754 tons, the lowest in four years. Of this total, 18,494 tons were consigned to Europe and American and the balance to the Orient. The most important producing mine was the St. Eugene, which contributed 14,719 to the year's yield.

According to a report furnished the American Iron and Steel Association by manufacturers, Canada's production of pig iron during the first six months of 1907 was 270,100 tons, a slight decrease as compared with the return for the corresponding period of 1906. With the operation of other plants now completed it is reasonable to expect that ere the close of the year the deficiency shall have been more than made good. On June the 30th, there were ten furnaces in the Dominion in blast, while four were idle for the time being.

In a recent report the United States vice-consul at Dawson refers to the change now taking place in mining methods in the Yukon, and more especially in the vicinity of Dawson, where dredging is entirely replacing the work of individual miners. This has, of course, had the effect of not only depopulating the creeks but has also hit tradesmen and merchants in the town somewhat severely, since the demand for supplies and provisions by miners has been considerably curtailed. On the other hand the change in conditions has and is proving beneficial to the small mine holder who has now the opportunity of selling at a fair price a property which would scarcely pay to work by the old methods of wood fire or steam thawing. It has, moreover, created activity in the staking of unoccupied ground which heretofore was not considered workable.

The output of copper from the Boundary District for the half year ending June 30th, is though relatively satisfactory, disappointing as compared with the 1906 figures. Thus during this period the two refineries in the United States to which the product is consigned, received in round figures fourteen million pounds, as compared with nearly eighteen million pounds for the first six months of 1906. The decrease of course is merely temporary, due largely to a shortage of railway cars and of coke for the smelters. Once these drawbacks are removed the output of the Boundary mines should continue to show a large increase, as it is proposed to enlarge the smelter at Grand Forks, while the Dominion Copper Co. is arranging to install converters and other wise increase the capacity of its smelting plant at Boundary Falls.

Mr. J. T. Hillis, managing director of the Hidden Creek Mining Co., operating properties near Port Simpson, B.C., is now residing in Vancouver, where offices have been established.

Mr. Stanley N. Graham, Superintendent of Mina El Favor, Jalisco, Mexico, is visiting Canada for a few weeks. Mr. Graham reports the El Favor as showing up high silver values.

Mr. D. A. McAulay, late assistant chief engineer of the Western Canadian Collieries Company, Blairmore, B.C., has been appointed chief engineer of the North Atlantic Collieries, Port Morien, Cape Breton.

The Hon. Robert Drummond returned from his trip over the water, and arrived in Sydney on the 12th August, where he will appear as a witness for the Coal Company in Steel v. Coal.

Mr. J. W. Frank, a mining engineer of Reno, Nevada, has recently returned from a visit to the oil fields on the Athabasca river in the interests of the British-American Oil Company, of Seattle. Mr. Frank speaks very enthusiastically of the potentialities of this field, and also refers to the occurrence of ashphaltum in great quantity, which he believes may under more favorable conditions than at present existing be turned to commercial account.

Gold dredging on the Saskatchewan river has heretofore not been attended with any notable success; but apparently another attempt is to be made on a larger scale, and a dredge having a daily capacity of from 2,500 to 3,999 cu. yds. a day is being installed at Mud Creek by the Northey Dredging Company to operate over a distance of fifteen miles of river bed covered by the company's leases. It is stated that it is also hoped to recover platinum, of which there are fair prospects.

According to a tabulated statement published by the *Mining Reporter* (Denver), the mines of the United States and Canada paid the sum of $17,767,788 during July. The largest individual dividend was that of the U. S. Steel Corporation which is credited with a distribution of over two and half millions, while the Anaconda Copper Co. follows next with a dividend payment of two million, one hundred thousand dollars. So far as Canada is concerned we note that our contemporary's returns are by no means complete.

An interesting drilling contest took place recently at Rossland between the members of the assaying and surveying staffs of the Centre Star mine. It is reported that great damages was done to the rock by both teams. However, the assayers managed to hit the head of the drill oftenest and won the match with a record of eight and five-eighth inches.

Mr. Shirley Davidson, who together with Miss Eilleen Hingston, was drowned in the St. Lawrence at Varennes on the 3rd of August, was very well known around the collieries at Glace Bay. Mr. Davidson came to Cape Breton as electrical engineer for the Dominion Iron & Steel Co., and later he went with the Dominion Coal Co., as assistant engineer. He left the coal company in 1905 and at the time of his death was practising as a contracting engineer in partnership with Mr. P. von Aueberg, late the coal company's construction engineer. As far as the circumstances attending the accident can be surmised there can be little doubt that Mr. Davidson lost his life in the attempt to save Miss Hingston. Those who knew Shirley Davidson say this was just the sort of thing that he would do, and he will not soon be forgotten by his friends at Glace Bay and Sydney.

Mr. T. J. Smith, President of the Diamond Vale Coal Mines Limited, who is at present visiting Montreal, stated in the course of an interview, that in his opinion it will scarcely be possible, even with increased development, for the coal mines in the west to keep pace with the great and growing demand for fuel required for railway and smelter purposes in Alberta and British Columbia. A determined effort, notwithstanding, is being made to meet this demand, and in nearly every case the mines in a position to ship have increased their working forces. The Diamond Vale mines are situated in the Nicola district, to which a branch line of the C. P. R. has just been constructed. This will afford a market for the Nicola coal not only in the Kootenays, but at the Coast. It is interesting to note, according to Mr. Smith's statement, that heretofore coal used for blacksmithing purposes in British Columbia has been brought all the way from Cape Breton at a cost of $18.50 a ton; but it is thought that this will no longer be necessary, since the Nicola coal is said to be quite suitable.

CORRESPONDENCE

To the Editor, CANADIAN MINING JOURNAL.

Allow me to welcome THE CANADIAN MINING JOURNAL as an unexpected but powerful ally, and to thank you for the summary, in 15th July number of the discovery of the Klondike.

I have worked on this matter for eight years, or since hearing in 1899 Henderson's story of the discovery. I was then editor of *The Yukon Sun*, and believed, as now, that a Canadian should get credit for his work.

Of the many articles written by me for Ontario papers, nearly all have been returned with the intimation that the subject was not of interest now—not as interesting as Mrs. Jones' garden party, and what the guests wore.

Most of these papers prefer to copy (because they are cheap) the sensational lies concocted in Seattle, as news from Dawson "Alaska." When a Yukoner attempts to correct them they suppress his letter. Because of Carmac's residence in that city, the Seattle papers have made a determined effort to establish his claim to the title of discoverer.

To settle the matter for all time, I have during some years past secured letters from all the Commissioners (Governors) of the Yukon, and from the leading pioneers (from the latter affidavits) all giving Robert Henderson, of Pictou, Nova Scotia, the full credit.

These gentlemen are: Wm. Ogilvie, Hon. Jas. H. Ross, Fred. T. Congdon, W. W. B. McInnes; also from acting Commissioners Major Z. T. Wood and J. T. Lithgow, and from Dr. Alfred Thompson, M.P. for the Yukon.

The affidavits are from leading pioneers like Thos. W. Kirkpatrick, Thos. W. O'Brien, Alexander McDonald (King of the Klondike), Al. Day, Jas. McNamee, Wm. Lloyd, M. F. Thompson, Abram H. Anderson, Carlo Tilley, and others.

Mr. Wm. Ogilvie, a pioneer of 1887, 1905, etc., and by far the best authority on early Yukon history, writes me:—

"1st. Robert Henderson discovered gold on the Indian River fully a year before Carmac was on the Klondike in any way as a miner.

"2nd. Henderson discovered gold in the Klondike basin months before Carmac.

"3rd. It was through information and advice given him by Henderson that Carmac thought of visiting the Klondike as a miner.

"4th. To the above facts I have as my authority the narrative of both men, given me personally."

Carmac was invited by Henderson to leave his salmon fishing and Indian wife at Dawson, come up and stake on his new find on Hunker Gold-Bottom Creek. When Carmac was leaving, after staking, Henderson straightly charged him to test the gravel on Rabbit Creek (now Bonanza), and if he found anything, to send one of his Indian companions back, and Henderson would pay him (the Indian).

Carmac stumbled on the richest part of the Indian River—Klondike gold fields—already pretty well mapped out by Henderson's work and discoveries in both basins of the district, but his base ingratitude prevented Henderson from securing a rich claim as a reward for his years of solitary, dangerous and thankless work.

Henderson's reward for his pluck, tenacity and endurance, and for being instrumental in adding $150,000,000 in gold to the world's supply, as well as giving Canada a world-wide advertisement, was as follows:—

1. He received a ghastly and almost fatal wound in his leg while prospecting all alone on the upper waters of the Indian River in 1895.

2. He was for a time deprived of the credit for the discovery of the Klondike because he did not become wealthy, while Carmac, without forethought or labor, did.

3. He was deprived of the credit of naming Hunker Creek, which he discovered and staked before Hunker saw it. Henderson's name of "Gold Bottom" still persists on its branch.

4. He was refused by the proper Government official the record of two discovery claims justly due him. He was allowed to stake one claim out of five properly applied for. The Department of the Interior, six years later, admitted the wrong.

5. He was refused, while still weak from a surgical operation on his injured leg, the ordinary courtesy of a proper extension of time, in which to represent his claim on Hunker, and had to sacrifice this rich claim for a song, or lose it altogether.

6. He was put off with excuses ("mislaid book") in applying for a renewal for his Quartz Creek claim, until it lapsed and was lost to him.

7. He was, many years later, granted in compensation, the worthless right of staking four claims (2,000 feet) on any unoccupied Government ground, but when he found anything of that kind worth staking, he was always met with the statement that it was already applied for (in some cases for compensation).

8. By the financial aid of the writer he was sent to Ottawa to press his just claim, but had no show there. The Hon. Jas. H. Ross kindly secured him a temporary appointment on the mining staff in Yukon. The Department of the Interior saw to it that he receives, next to the charwomen, about the lowest Government salary in Dawson.

9. His valuable services have been freely availed of by the Government, and for two years past he has accompanied geologists on their trips up Pelly River, where Henderson believes there are rich placer gold diggings to be found.

When I took up the matter for Henderson through Lord Minto in 1900-01, the Department of the Interior attempted to turn me down. How they succeeded will best be known by reading this extract of a letter from the said Department to the Hon. Jas. H. Ross, Commissioner of the Yukon, in May, 1902, after a full investigation of the matter:—

"The regulations in force for the year 1896 provided that no miner should receive a grant of more than one mining claim in the same locality, and that it was not until January, 1898, that provision was made in the regulations that the miner should receive a grant of only one claim in the same district, the boundaries of which were to be defined by the mining recorder.

"As the creeks upon which Mr. Henderson claims to have staked could scarce be considered as being in the same locality within the meaning of the regulations, and as the regulations at that time did not provide for the formation of mining districts, it has been decided that Mr. Henderson should be granted consideration in accord with the regulations in force at the time he staked and recorded.

"Please advise this Department of the consideration you think should be granted to Mr. Henderson for the loss alleged to have been sustained by him."

But that is about as far as the compensation has gone. And that is the usual manner in which brave, generous, indomitable and far-seeing pioneers like Robert Henderson, of Pictou, Nova Scotia, are treated by their fellows and by paternal Governments alike.

I shall be pleased to write you a brief account of his work in discovering the Klondike if you wish it.

Yours,

HENRY J. WOODSIDE.

Ottawa, Ont., Aug. 6th, 1907.

The Editor, The Canadian Mining Journal:

Sir,—I have read your "Suggestion" in the number of August 1st, regarding the advisability of uniting the offices of Secretary and Treasurer.

It seems to me that the objection to this is that people would say there was no check on the officer holding the dual office. So far as I am personally concerned, my opinion is that anything which increases the salary of the Secretary is advisable, because upon him and him solely, depends the extension of and stimulation in the Institute between sessions. An institute of this kind, which is active at only a limited period of the year, soon becomes forgotten unless a man of strong character, magnetism, ability and energy, like Dr. Raymond, of New York, stamps it with his own character. Undoubtedly the American Institute of Mining Engineers depends for its activity and prominence more upon Dr. Raymond than on all other influences combined.

A man understanding mining and the interests of mining, and of the character above mentioned, should be the Secretary; and, if necessary to make it an object, the Treasurer as well, although it seems to me that the Institute should pay a liberal salary to its Secretary, independent of the duties of Treasurer.

Without doubt, the mining interests of Canada are increasing so rapidly, and becoming so extensive, that a flourishing and powerful Mining Institute should exist. I do not know Mr. Lamb very well, but I fancy he is a man of ability, and is well fitted for the office he holds, and I for one, although a member who has not been active during

the past eight years, shall always be in favor of making the consideration sufficient to recompense him for all possible expenditure of time and money, and make it an object for him to be exceedingly active. Yours very truly,

FRANK C. LORING.

To the Editor, The Canadian Mining Journal :

Dear Sir,—It is no doubt a matter of personal opinion as to how far your editorial of August 1st, entitled "Another Suggestion," was written in the spirit of fault-finding. When I first read it I certainly did not recognize any touch of personal criticism. The Canadian Mining Institute is young and its opportunities are growing very rapidly; no matter how efficient its individual officials may be its general plan of operations may well be open to criticism, and I for one would welcome your editorial as being timely and valuable even if it might be open to somewhat harsh interpretation.

There can be no question whatever about the Institute requiring the whole services and time of one man as Secretary, and in saying this I am making no criticism of the present Secretary, for whom I have a very warm personal regard. If the Institute cannot afford to command one man's whole time except by combining the two salaries of the Secretary and the Treasurer, I certainly think it goes without saying that the two offices should be held by one man. The only argument I can foresee against this is the personal argument as a result of the appreciation of Mr. Stevenson Brown's many years of valued work; but I am not discussing personalities, I would deal with this in the abstract. I would consider the Secretary by far the most important official of the Institute, more important than the President himself, for it is considered essential that the various widely separated mining centres of the Province be in turn represented in the official chair. The Secretary should belong to no centre, and consequently should act for all, and being more or less permanent in his position he can initiate and carry out plans and improvements requiring several years for their fulfilments. The present Secretary has been so intimately associated with the mining industry in Canada for so many years and in so many different parts that he is specially able to take a large general view. Everything that can be done to quicken his enthusiasm and strengthen his hand should most certainly be done.

You have touched upon a point of vital importance when you speak of doubling the membership within twelve months. It would be quite possible to double the membership and kill the usefulness of the Institute. This question of membership is one upon which I feel very strongly and it is one which requires perfectly plain, candid, outspoken discussion. There are two distinct types of institutions connected with engineering enterprise. The one is the select technical, the other the open, almost commercial, institution. The first is represented by the Institution of Civil Engineers and the Institution of Mining and Metallurgy. Members of these Institutions are all technical men of experience and good standing. They have a sealed certificate of membership which is practically a diploma and which to a large extent is a guarantee of good standing. Of the other class the Institution of Mining Engineers and the American Institute of Mining Engineers are typical examples; almost anybody can obtain membership in these. It is an open question which of these types is the more valuable, but there is no question whatsoever of the very great value of the American Institute. The Canadian Mining Institute is neither one thing nor the other; it imitates the English idea of the ultra-select technical association by giving a large, red-sealed certificate of membership, on the other hand it has admitted almost anybody and everybody into membership. It is time that the Institute came out definitely and plainly in regard to this point. A move was made in this direction at the last general meeting by the amendment of the by-laws, arranging for Associate Members. This seems to me to be a rather hesitating attempt towards making this a select society based on the English pattern. I do not think this suits the present conditions. I am most certainly in favor of an open society, similar to a large extent to the American Institute, but though I am in favor of a more open membership I would draw a very hard, well-defined line as to who should not be members. Those interested in mining can be divided into two classes. Those seeking to make money out of the ground and those seeking to make money out of the public, and there is a very great gulf between these two classes. I would admit to full membership everybody seeking to make money out of the ground, who has a clean reputation, whether he is an ultra-technical metallurgist, a shareholder or a mucker, but I would keep out as rigidly as possible everybody seeking to make money out of the public. This would keep out almost all the brokers and almost all the promoters. There is a very small minority of promoters and brokers who would be valued members, but I would rather lose these than run chances of admitting the average broker or promoter. A medical association might better have the vendors of a fake patent medicine among its members than for us to have the wild-cat promoter and broker in our Mining Institute. It is always an unexplained wonder how the public tolerates these wild-cat promoters. Many hard-headed business and professional men who have all their life been building up and caring for their reputations, have allowed them to be prostituted in these wild-cat prospectuses. The average mine promoter is a procurer; he panders to the gambling spirit and he does not care whom he ruins so long as he can sell his stock. This type, and by far the largest number of mining company promoters belong to this type, should not, under any circumstances, be tolerated in a self-respecting association of business men. It is not necessary to have any special by-laws to keep these men out. The present by-laws are sufficient, and the action of recent councils has been in the right direction, but it behooves the present council to be still more careful in their choice of members.

I do not like the new by-laws admitting Associate Members. Let me illustrate by a special example : Under this new clause the business manager of a machinery supply house or of a powder manufacturing company would be an Associate Member with no power to vote, yet this class of men knows more of the mining industry throughout the country and has got the general welfare more at heart than any

technical mine manager or metallurgist. These business men probably will not write papers nor will they take much part in technical discussions, but their experience and training would be of very great value in all matters of general welfare. This is the type of men that I would welcome into the Institute.

The technical man cannot look to the Institute to promote or preserve the tone or standing of either the individual or the whole technical body. To expect this even in a small degree from the Institute is to narrowly circumscribe its work. Thanks very largely to the excellent choice of technical men in the Government departments the public has been, to a certain extent, educated to a respectful appreciation of the tone and standing of the technical man. Our Government mining men are only carrying out the traditions of their training, but their work is laying a good foundation. This work must be carried on by the individual technical man and not by the Mining Institute. The words of Dr. Raymond in connection with the American Institute fit our case exactly: "The pressing need of the hour was not the segregation of a select body, but the cordial co-operation of all the representatives of a great industry or group of industries."

Yours faithfully,

H. E. T. HAULTAIN.

Craigmont, Aug. 22nd, 1907.

To the Editor of The Canadian Mining Journal:

Sir,—I note in your last issue a letter from Mr. W. H. Prest, criticizing my remarks regarding the stealing of gold in Nova Scotia.

Mr. Prest is right in saying that I am far from wishing to blacken the character of Nova Scotian miners as a class, but the facts that I have stated have come from miners themselves, foremen and others, men in whom I have the greatest confidence.

My object in stating the facts so openly is that the subject has been kept comparatively quiet, and the matter of gold stealing has not become to any extent a matter of criminal record. If the census reports, to which Mr. Prest refers me, contained the desired information there would be no need for more to be said on the subject.

As to the phrase, "Miners' rights," I know from personal experience that such a custom prevailed recently in at least one district in Nova Scotia and I am informed on the authority of credible, experienced men, men who may not have spent 35 years of their lives in Nova Scotia, but who at least are still here, that the so-called "Miners' rights" were known in other parts of the Province, notably in two districts situated about equi-distant east and west of Halifax. I am surprised that Mr. Prest has not heard of these "Rights."

Mr. Prest must realize that his picture of the conditions on the stopes is hardly a fair one.

On a large vein, where the whole belt was handled together, such conditions might prevail; but as a rule it was not such cases that furnished the greatest opportunity for stealing gold. It was in the small nuggety veins, where most of the gold occurred in specimens, such as that pictures on the cover of the last issue of the Journal, that most of the gold was stolen. In such cases the lode was, where possible, not mined until after the "working belt" had been removed, probably being scaffolded, when the quartz was shot down and shovelled to the shaft, often, as I have said, in a stream of water.

Why the idea of such a stream of water should conjure up visions of such immense pumping plants, I cannot imagine. The stream of water that a 4-inch "Jackhead" pump would handle would be quite sufficient to wash a lot of quartz lying as it would along the flat "underhand" stopes.

Yours very truly,

E. PERCY BROWN.

THE OIL SHALES OF SCOTLAND

An American Consular report dwells upon the oil shales of Linlithgow and Edinburgh Counties. The production of oil shale from these counties in 1904 was 2,331,885 tons. From this shale were extracted:—Burning oil, 16,991,746 gallons; naptha, 2,517,296 gallons; gas oil, 37,997 tons; lubricating oil, 39,476 tons; paraffin wax, 22,476 tons; sulphate of ammonia, 49,600 tons.

The workable seams occur in the upper of two subdivisions of the calciferous sandstone series. The upper, known as the oil shale group, is over 3,000 feet in thickness and contains in its higher parts beds of coal, usually of inferior quality, and, further down, about six main seams of oil shale, interstratified with beds of sandstone, shale, fireclay, marl, and estuarine limestone. The lower group, in which no oil shales of economic importance have yet been found, consists of white sandstone and shales passing downward into gray, green and red shales, clays, marls and sandstones, with beds of argillaceous limestone or cement or cement stone.

Good shale can, as a rule, be distinguished by its brown streak, toughness, and resistance to disintegration by the weather. Ordinary carbonaceous shale is more or les brittle and ofter gritty and weathers to clay or wind. Oil shale, on the other hand, resembles dark wood, and its quality is measured by the degree of facility with which it can be cut and curled up with the edge of a sharp knife. It is free from grittiness, and is often flexible as well as tough. In internal structure oil shale is minutely laminated, which is apparent in the "spent shale," after distillation, when it is thrown out in fragments composed of extremely thin sheets. It seems to be a general law that shales deteriorate with depth. The highest shale in the Scottish series is the richest in crude oil, supplying 130 gallons per ton, but only a few pounds of sulphate of ammonia, while the lowest shale yields only about 80 gallons per ton, but the sulphate of ammonia amounts to 60 pounds.

Mr. D. H. Pringle, formerly of the staff of the British American Trust Company, has been appointed general manager for the Galbraith Coal Company, the Alberta Coal & Coke Company, and the Alberta Fuel Company, with headquarters at Calgary, Alta.

SPECIAL CORRESPONDENCE

NOVA SCOTIA

Glace Bay.—The plebiscite on the Scott Act was held on the 15th of August in Cape Breton County, and resulted in a majority of 1,000 against the retention of the Scott Act. The Nova Scotia License Act will automatically come into operation after the expiration of thirty days. It is a most stringent enactment, and unless altered will really act more as a prohibitive law than did the form of local option which is now repealed. The Provincial license law allows "off licenses" with certain restrictions, and licenses the sale of liquor to bona fide guests actually in the dining-room of hotels. It forbids the sale of liquor within certain limits of a tram line or colliery, and in the neighborhood of schools and churches. The vote just cast was very largely a religious one, the Presbyterians, Methodists and Baptists voting for the Act, and the Catholics and Church of England voting for license. Such a law must of course be inoperative, and it is to be hoped for the sake of our mining community that we shall get a workable and reasonably stringent law. Now that our legislators have the opportunity there will be no excuse if we do not get an act that will stop shebeening and secret drinking while providing protection for the inebriate and the minor. Glace Bay is not Utopia. It is a workaday place, and we want a workaday law that can be obeyed by the man in the street. We don't want to be left to the tender mercies of an unscrupulous brewing monopoly, and we don't want to live under the blue laws of an earnest but puritanical temperance party. Is there no golden mean?

We again commend this question to the consideration of the Provincial Workmen's Association, and we have reason to believe that if a concerted effort were made amongst the miners for the establishment of colliery reading rooms and recreative institutions along the lines of those established by the Colorado Fuel Co. before referred to in this Journal and for the passing of practical liquor laws it would receive the hearty support of the colliery corporations and the thinking men in the colliery districts generally.

In Sydney and the colliery districts there are little coteries of cultured people who have their reading circles and their literary and social societies, but for the great bulk of the laboring class absolutely no intellectual facilities of any kind are provided, outside of religious organizations, and the efforts of some earnest friends of technical education, who have received such feeble support that they have lost heart.

If the clergy and the P. W. A. would sink their religious, intellectual and political differences and take this matter seriously under advisement in the endeavor to provide for our mining and steel working population some refuge from the desolating boredom and intellectual stultification of so many of their lives, it would do more real good than libraries of prohibitory enactments and sermons. The P. W. A. and the various church organizations do a vast amount of good as it is, but anyone who views the aimless parading of Charlotte Street in Sydney and the expectorating crowd who nightly gather around the tram corners in Glace Bay, cannot but be impressed by the fact that our people lack occupation for their leisure hours. There is a connection between the success of American correspondence schools and the acuteness of the liquor problem in the mining districts that we think points to a desire on the part of the workers for intellectual and recreative occupation that at present is either ungratified or perverted from its natural fruition.

Arising out of the fatal accident by which three men lost their lives on the 6th of July, two employees of the Nova Scotia Steel & Coal Company have been arrested on a charge of manslaughter, and no doubt an investigation of the causes that led up to the accident will follow. This procedure is perfectly regular and follows on the finding of the jury, and would call for no comment, were it not that the "Halifax Herald" again reflects on the intelligence and honesty of our Mines Department and the mining community of Nova Scotia generally.

The "Herald" writes: "Will the Government publish statistics of the number of men killed in Nova Scotia mines last year?" This is a surprising question, seeing that the Department of Mines of Nova Scotia have published such statistics annually since the early seventies, and such a question confirms our previous suspicion that the "Herald" writer doesn't quite know what he is talking about.

The "Herald" makes a comparison between the mines of Nova Scotia and the mines and railways of the United States, and comments as follows: "By the time a President and a General Manager of Nova Scotia railways or mines are arrested for the deaths of men in their employ, through the failure of other employees to do their duty, then our big corporations will begin to take notice."

We welcome this comparison, for in it we have nothing to suffer in Nova Scotia, but heaven forbid that we should ever imitate the mines and railways of the United States in the matter of fatal accidents. We hardly think it is necessary to do more than quote the "Herald's" statement if we quote with it official figures showing how Nova Scotia compares with the other mining centres of the world as to fatal accidents. The figures will speak for themselves. Nova Scotia, as province, has nothing to be ashamed of in this respect, and we may safely claim that in Cape Breton the percentage of fatal accidents to the tonnage produced is the lowest in the world. The figures which are complied from the Report of the Mines Department of Nova Scotia for 1905, and from the Report of Foreign and Colonial Statistics, issued by the English Government and recently quoted in this Journal.

Statistics of Fatal Accidents in Mines, 1905:—

	Number of fatal Accidents.	No. of men employed in Mines.	Deaths per 1,000.	Tons Produced.	Tons per fatal Acc't.	Percentage of deaths per 10,000 tons Produced.
United States	2,160	626,000	3.45	356,454,000	165,000	.606 p.c.
Germany	1,123	548,000	2.05	173,811,000	154,773	.645 p.c.
Nova Scotia	20	10,870	1.86	5,050,420	250,000	.396 p.c.
Great Britain	1,138	843,000	1.35	239,918,000	210,800	.475 p.c.
France	182	175,000	1.04	35,928,000	200,000	.506 p.c.
Approx. tot'l for world	10,000	5,000,000	2.01	941,000,000	94,000	1.050 p.c.

It is a regrettable, but seemingly unavoidable fact that the mining of coal is everywhere alike attended by loss of life and limb, and the most careful supervision and care will not always prevent the occurrence of catastrophes, as witness the memorable explosion at Courrieres. This mine had been for years regarded as a model of safety, and the efforts of its engineers to minimise the loss of life by falls of roof had everywhere met with approval, but destruction came unawares at the last, and in a form the least expected.

The "Herald" says that if its interesting programme were

carried out the "big corporations would begin to take notice." They have taken notice. In 1905 the collieries of the Dominion Coal Company produced roughly 3,190,000 tons, with only six fatal accidents. This is an average of one per thousand, and a production of 530,000 tons per death. We believe this is unique.

At the present moment there seems to be an organized attempt among the newspapers of this Province to give a "black eye" to our mining industry generally. It is an ill bird that fouls its own nest they say, and we protest against this kind of thing, for Nova Scotians should be proud of their mining industry. It is the basis of their wealth, and supplies a vast population with employment, and we cannot see why for purely political ends our newspapers should pursue the course they do. Nova Scotia miners as a class are physically and mentally the superior of their brothers on the other side of the Atlantic and in the United States. They earn good wages, their labor organizations so far have been free from the evils that have characterized miners' unions in other parts of this Continent. As workers they produce more coal per man than in the majority of the mines of Europe. The coal seams here are magnificent big clean seams with roofs of exceptionally strong nature, the seams are so regular that a fault is almost unknown, their extent is as yet to a large degree unknown, the mines are kept ventilated by vast currents of fresh air, the surface equipment of the collieries is superb, and for production, safety, and general efficiency Nova Scotian mines will bear comparison with any bituminous mines anywhere. These are the facts, but a stranger reading the jeremiads of some of our provincial press might be excused if he came to the conclusion that our mines were death traps, our coal seams of poor quality, and our miners and their officers lacking in ordinary intelligence.

ONTARIO

Cobalt.—An arrangement has been made by the Nipissing people whereby they are to dispose of the cobalt from their ore in Germany. It is also probable that Nipissing will erect a smelter in Cobalt.

On one car load of ore La Rose mine recently netted $112,000.

Most of the mines, against which the Western Federation were most active, are working normally again. The Coniagas, Trethewey, Cobalt Lake, Buffalo, Nipissing and many others are doing full time. The obstructive tactics of the labor leaders are becoming more violent but less effective.

The Foster mine shipped a car of No. 1 ore early in August. It netted $28,500. Development of the mine is being pushed. About eight months of stoping is blocked out.

Organizer Roadhouse, of the Western Federation, is scarcely worthy of passing notice. He has been using such intemperate language that the better class of miners are losing all sympathy with him and his cause. His flowers of cheap and nasty rhetoric need a dash of scent. He is fast becoming a public nuisance.

The report that the Colonial Mine would meet all the demands of the Union (as did its neighbor the King Edward) has not been confirmed.

The O'Brien Mine has 135 men working. This number includes the necessary skilled labor. Recently four good veins have been stripped.

The Provincial Government Mine has installed the first half of a twelve-drill compressor.

Mr. E. L. Fralick, engineer of the Cobalt Lake Mining Company, in his last report of progress, states that shaft No. 4 is down 92 feet. A level station has been started in this shaft at 86 feet and the drift is in 46 feet. Shaft No. 5 is down 95 feet. Here also a level has been started.

The Temiscaming Mining Company's shaft has been sunk seventy-eight feet. Drifting to the extent of ninety feet has been accomplished. The first shipment was a car of 21 tons, for which the shippers received over $91,000. Two other cars were shipped last week.

ALBERTA.

Car shortage along Crow's Nest Pass.

Lille and Bellevue.—For lack of cars the company, having no place to store coal, knock off shifts and men leave, always the best men. Many of these men finding it no better in other coal mines, find work over ground or in quartz mines, and are permanently lost to coal mining.

Having no room to store screened coal, they cannot take out the slack coal, and consequently cannot keep the coke ovens running steadily. This again threatens the coke supply of the smelters.

Frank.—No complaint. The C. P. R. has contracted for total outpue and supplies sufficient cars.

Coleman.—The International Coal and Coke Co. have been hard hit. They were able to increase their hard hit. They were able to increase their output by doubling shifts. Before taking that step they asked the C. P. R. if they would furnish cars for increased output and were assured a steady supply. They went to extra expense, in doubling their shifts, which meant raising several men to "bosses" at increased wages. They advertised for more miners and got them. But when the output was increased the cars were not always supplied. The men were laid off for three days each in two successive weeks. Here again the men left and when cars came the company did not have the men. As a result the management never know what cars or what men to count on.

Michel, B.C.—Here, too, on the same assurances of cars from C. P. R., the Crow's Nest Pass Coal Co. put on a double shift with results similar to those at Coleman.

Coal Creek, B.C.—Here the Crow's Nest Pass Co. are helped out by the Great Northern Ry., and are not dependent on the C. P. R. The confidence thus promoted is reflected in the class of miners employed. They have the best class of miners along the Pass, including many married men who settle down here for their homes.

After talking with mine managers and C. P. R. agents, I conclude that the C.P.R. is partially responsible for shortage of fuel, coke and help. If they had no cars they could not be blamed. But that they have cars is evident from the fact that they assured the coal companies a definite supply right along. Moreover C. P. R. agents have told me that there are enough cars, but that the company gives preference to loaded cars over "empties," hauling the latter to the mines when they get time.

The Western newspapers are misleading on the car shortage question. In an interview in a Nelson paper, Vice-President McNichol, of the C.P.R., said their was no shortage. Similar interviews appear daily from other men. The facts are as stated above, and the outlook is that when the grain hauling starts, conditions will be worse. It is freely said that some smelters will close down next winter rather than hobble along as it seems now they will have to. If there is a fuel famine next winter it will not be due to lack of miners, but to lack of cars. The coal companies cannot store coal for future use nor get it out for dealers to store it.

The car shortage is not constant at any point, but is a constant menace, and the busy season for the railways is yet to come.

GENERAL MINING NEWS

NOVA SCOTIA.

Springhill, N.S.—The third week of the strike has brought no change. The Cumberland Coal and Railway Company has rechartered all its barges and tugs to outside parties, and has paid off its loaders at Parrsboro and St. John. The mine horses have been removed. In the improbable event of the mechanics joining the strikers, the Provincial Government has instructed Deputy Inspector Cameron to secure all the men necessary to keep the mines in safe running order.

Sydney.—The McKay Coal Mine now being opened up between Sydney and North Sydney, employs about forty men. The output, between 40 and 50 tons per day, is distributed along various points on the I. C. R. in Cape Breton.

Port Morien.—The Gowrie and Blockhouse collieries, recently taken over by the North Atlantic Collieries Limited, are being put into good shape. Overground the miners' cottages, the power house and bankhead, are being repaired. A pipe line of water supply is to be laid to Sand Lake. Under the supervision of P. J. Leslie, 200 feet will be added to the breakwater. The government dredge is deepening the approaches to the breakwater and the company's pier.

Halifax.—Sixty of the one hundred and thirty candidates who tried the mining examinations qualifying for the positions of manager, underground manager and overmen, have passed. Seventy of the candidates were from Cape Breton County. Thirty-three of these were successful. The other successful candidates were distributed thus: Eight from Inverness, eight from Pictou, and eleven from Cumberland. Six candidates passed the mine managers examination, Of these five came from Cape Breton and one from Cumberland.

Sydney.—No. 2 Blast Furnace of the Dominion Iron and Steel Co. was blown in on August 8th. On the afternoon of August 10th it was producing iron and was working in good shape.

ONTARIO.

Sudbury.—It is reported that the Chapin syndicate has made a first payment of $240,000 on the Whistle and other properties on the north nickle range. Mr. R. W. Demorest is in charge of the prospecting.

Sault Ste. Marie.—The contract for the construction of the short line of railway from the Algoma Central to the Superior Copper Company's mine, has been awarded to the O'Boyle Brothers Construction Company. The line will run for five miles in a westerly direction from the 38 mileage post of the Algoma Central. It will be completed in one year at a cost of about $100,000. It is probable that the ore, to the amount of two hundred tons per day will be shipped to the new smelter of the Bruce Mines Company.

Reports have come in to the effect that J. B. Miller has discovered a large deposit of nickel ore near Washington.

Cobalt.—The King Edward Mine and the Colonial have started work again. Both of these mines were shut down on account of the strike.

On the Trethewey mine a diamond drill is down 580 feet. Several veins, one of which is silver-bearing, have been cut.

A rich eighteen inch silver vein was recently cut on No. 1 shaft of the Buffalo mine.

Chief Justice Falconbridge on August 14th, granted an interim injuction, valid until August 29th, restraining Cobalt Branch 146, of the Western Federation of Miners, and certain of its officers and members, from interfering with the men employed by the Buffalo Company.

Bulletin No. 3 issued by the Foster Cobalt Mining Company is encouraging. Vein No. 6 has widened. Veins No. 5 and 8 are showing up strong at the 70-foot level. A car of No. 1 ore recently shipped netted $28,500.

The machinery for the new concentrator plant of the Cobalt Central has been shipped. It is hoped that the plant will be in operation in October.

ALBERTA.

A C. Flumerfelt, President of the International Coal and Coke Company of Coleman, and of the Alberta Coal Company of Lundbreck, and N. H. Galer, vice-president and general manager of those companies are opening a new mine, the third coming under their control. They have organized the Royal Collieries Ltd., and have acquired the Barnes Mine, five miles from Lethbridge, together with 600 acres of coal land. The Barnes mine has heretofore been operated on a small scale. The new owners will install a large and modern plant.

Between eighty and ninety employees of the Alberta Railway and Irrigation Company, at their Galt Mines, Lethbridge, refused to go to work on August 12th. The men affected were the drivers, shiftmen and grippers. The drivers claimed that their time started when they harnessed their horses, while the company claims that their "working place" is where they hitch to the car in the mine. The men in striking acted against the advice of the union officials. The men returned to work on August 14th, pending an investigation.

BRITISH COLUMBIA.

Boundary.—Six machine men were added to the force of the Cariboo-McKinney mine this week.

Both the Granby and the B. C. Copper Companies are operating their furnaces with practically no reserve of coke. Apparently the railways are quite unable to handle a sufficient and regular supply. The Dominion Copper is running smoothly.

The foundations for the fifth giant ore crusher to be installed by the Granby Company, are now complete. The crusher is being placed at their Gold Drop mine.

Cariboo.—The Thistle Mining Company began piping this season on May 9th. Until June 20th they ran double shift. After that date there was only enough water for a day shift. About 22,500 car loads was moved. A bank-blast of 4,000 pounds of black powder is to be put in this autumn and the shattered ground will be piped with the fall freshet water.

The bedrock clean up of the Alabama Hydraulic, on Mosquito Creek, was over 400 ounces. The sluice flume is expected to yield from 30 to 50 ounces.

Phoenix.—A very serious cave-in occurred on the evening of August 12th at the Brooklyn mine of the Dominion Copper Company. The cave-in happened at 7 p.m., and, fortunately, there were no men in the mine at the time. The shaft is intact, but the ore-bunkers and waste-dump have dropped down below the 200-foot level. Shipping was delayed only a few days. No lives were lost.

Vancouver.—The Guggenheims have placed an order with a local firm for five hundred tons of general provisions to be shipped immediately to Dawson. The supplies are for their mining camps on the Klondike Creeks.

Mr. E. Lindeman, who was sent by the Federal Government to investigate the iron ore deposits of Vancouver Island, is on the west coast. He will make magnetic surveys of Sechut and Sareta, visiting also Kennedy Lake and Head Bay on Nootka Sound and Quatsino, and spending about a month around Barkley Sound. He will also make a trip to Texada Island.

Gold, silver and copper are reported on a mineral discovery at the confluence of the Skeena and Ecstall Rivers, near Port Essington.

Victoria.—The steamer Princess Beatrice brought to Ladysmith on August 14th, the first shipment of ore from the Queen Charlotte Islands, to the Tyee smelter. She carried 300 tons of copper ore from the Ikeda Bay mine.

Ladysmith.—On account of the large increase in the smelting business, the Tyee Copper Companys smelter at Ladysmith will probably be doubled in capacity. Shipments are received not only from Company's mine at Mount Sicker, but also from many mines in Alaska, the Yukon, and from other districts on the Pacific. From the Ikeda, and other mines on the Queen Charlotte Islands, shipments are expected.

MINING NEWS OF THE WORLD

UNITED STATES.

The report of the Calumet & Hecla Co. for the fiscal year ending April 30th has just been published. It states that during this period 46,949 tons of refined copper were marketed, while the assets are placed at $8,757,444 and the liabilities at $1,728,942, leaving a balance of $7,028,942 to profit and loss. Dividends aggregating $6,500,000 were paid dur. ing the year. The company in extending its field of operations has secured options to Nov. 20th, 1907 for the examination of the Mamainse and Pointeax mine lands in Canada on the eastern shore of Lake Superior.

The Amalgamated Copper Co. has placed its stock on a regular 8 per cent. per annum basis. This rate was originally guaranteed but was probably not maintained in consequence of expensive law suits. The Company has paid to date since its incorporation in April, 1899, the large sum of $52,618,504. The outstanding capital is $153,877,900.

The Grant mine, in Washington, under option to the B. C. Copper Co. of Greenwood, B.C., is being actively operated and a 10-drill compressor has been installed with a view to increasing the monthly output to a thousand tons.

The coal production of the State of Wyoming for the year 1906 was, according to a recent report of the U. S. Geological Survey, 6,133,994 short tons, valued at $8,013,523, a considerable increase over the preceding year. Wyoming now ranks second among the coal producing states of the Union in point of tonnage produced per man employed. The majority of the mines work ten hour shifts.

As a result of the labor troubles at Bisbee early in the year, and now like disturbances at Clifton, copper production from Arizona in 1907 is, it is thought, not likely to show an increase.

The annual report of the Utah Copper Co. now in course of preparation is likely to prove of great interest. This company is mining at a cost of 45 cents a ton, or with taxes and administrative charges added, not in excess of 68 cents, while it has fifteen miles of underground workings and forty million tons of 2 per cent. and sixty million tons of slightly lower grade copper ore blocked out.

The admission is made in the report of the Pennsylvannia Department of Mines for 1906, that the increase in the number of inspectors has had no appreciable effect in decreasing the number of accidents in coal mines. In fact in comparison with other fields the reverse is shown to be the case.

AUSTRALIA.

The affairs and finances of the Zinc Corporation appear to be in somewhat of a muddle. The Company purchased large stocks of Broken Hill tailings which it was expected could be profitably treated; and first the Potter process and then another method was tried without success and now the Elmore vaccum process is being tried. Meanwhile the company has come to the end of its resources and proposes to issue new capital in the shape of preference shares.

Australia's mineral production in 1906 was valued at $40,848,120, or an increase of nearly five and a half million dollars over the previous record achievement of 1905. The chief product, of course, was gold. Australia had produced to the end of 1906 minerals to the value of $862,801,910 since mining was inaugurated in the Commonwealth. The number of persons employed in mining during the year was approximately 42,500.

Both cemeteries at Ballarat, says a correspondent, to the London Mining Journal, are located on lode-bearing bedrock, and under a slight capping of clay soil quartz lodes and veins are found. At Buninyong, oldest of resting places in the Ballarat district, where gold was first discovered in 1851, gold miners long ago sought a lead under the cemetery, while the old cemetery in Ballarat is right on the line of some quartz lodes proved to be very valuable. Recently during a funeral the mourners noticed gold in the gravel dug from the grave, and obtained permission to test some few hundred pounds of it in a mill. The sample yielded at the rate of 2 oz. to the ton. We fear, however, that this last story is just the least bit "tall."

SOUTH AFRICA.

It is reported that at the present time the supply of native labor is actually greater than the demand for the mines of the Transvaal. The great trouble with the Kaffir as a miner is that, while he is tractable and willing, he will only remain at work for a comparatively short period of time, which of course seriously interferes with his becoming efficient. For years past the mines have attempted to instill into the natives the advantage of the piecework system, and it is in this direction that the greatest hope of rendering native labor efficient lies. Meanwhile it is satisfactory to learn that the strike of white miners on the Rand has been declared off, and the Government has induced mine owners to reengage many of the men on the old terms pending the report of the Mining Commission. Notwithstanding the strike a considerable increase in the mineral production of the Transvaal for the first six months of the present year is to be noted, the total value of the output for this periodbeing placed at £30,729,831.

CHINA.

In his report for 1906, the Commissioner of Customs at Tientsin states that the mines of the Chinese Mining and Engineering Company, while no longer the only source of coal supply in North China, continue to occupy the first place. The total output of these mines last year amounted to 958,675 tons, of which a large proportion was used on the railways.

INDIA.

In Burma the only working coal mine is situated in the Shwebe district, and here operations were recently suspended. Excellent coal, however, is found in the Upper Chindwin district, but at present too far away from all lines of communication to be workable.

The gold production of India for the first six months of this year amounted to 268,211 ozs., as against 292,956 oz. for the corresponding period of 1906. Of the tota, this year the Mysore Mines contributed 102,436 ozs.; and the Champion Reef 64,204 ozs.; the remainder being reported by the Oregum, Nundydroog and other mines.

RUSSIA.

The British Consul at St. Petersburg reports that the output of coal from the South of Russia for 1906 to have been 11,340,479 tons.

SWEDEN.

The condition of the Swedish iron market remains good, and the export continues to show satisfactory figures, which for the most descriptions exceed those of last year at the same time. The shipping of pig iron for January to May amounted to 34,000. Prices have kept at about the same level namely £5 10s. and £5 5s. per ton, f.o.b. shipping port, for iron of not more than 0.020 per cent. phosphorus.

STATISTICS AND RETURNS

On Shipments for the week ending Aug. 3rd, for the undermentioned districts of Britieh Columbia stand as follows :

	Week.	Year.
Boundary	30,567	675,234
Rossland	4,140	161,998
Slocan-Kootenay	3,025	76,746

The total shipments from the mines in the above districts for the past week were 37,732 tons and for the past week were 37,732 tons and for the year to date 913,978 tons.

For the week ending July 27th :—

	Week.	Year.
Boundary	37,573	644,667
Rossland	6,788	157,858
Slocan-Kootenay	2,987	71,721
Total	47,348	876,046

Following are the weekly shipments from Cobalt camp :

	Ore in lbs. Week Ending Aug. 10.	Ore in lbs. Since Jan. 1st.
Buffalo	60,000	1,398,830
Nipissing	64,360	3,155,438
Silver Queen	176,000	652,157

The total shipments for the week were 300,360 pounds, or 150 tons.

Following are the weekly shipments from Cobalt camp, and those from January 1 to date :—

	Ore in lbs. Week Ending Aug. 17.	Ore in lbs. Since Jan. 1st.
Buffalo	60,000	1,458,830
Coniagas		4,080,180
Cobalt Central		101,360
Colonial		74,250
Drummond		44,090
Foster		192,350
Green-Meehan		196,780
Hudson Bay		45,170
Kerr Lake (Jacobs)		249,000
LaRose	43,000	978,302
McKinley		188,000
Nipissing	296,808	3,452,246
Nova Scotia		96,000
O'Brien		2,220,254
Red Rock		40,000
Right of Way		134,530
Silver Queen		652,157
Silver Leaf		43,518
Trethewey		1,346,018
Townsite		84,078
Temiskaming	119,011	229,011
University		61,383
Imperial Cobalt		37,530

The total shipments for the week were 518,819 pounds, or 259 tons.

The total shipments since Jan. 1, 1907, are now 15,935,845 pounds, or 7,968 tons. In 1904 the camp produced 158 tons, valued at $136,217 ; in 1905, 2144 tons, valued at $1,473,196 ; in 1906, 5129 tons, valued at $3,900,000.

For the week ending August 10th the ore shipments in South Eastern British Columbia were seriously curtailed. The coke shortage has caused a temporary shut down, and the smelters are suffering from a congestion of ore. Following are the figures for the week :—

Shipments.	Week.	Year.
Boundary	31,560	706,794
East of Columbia River	2,640	79,350
Rossland	3,673	165,671
Total	37,873 tons	951,815 tons.

Smelter Receipts.

	Week.	Year.
Grand Forks	15,843	381,086
Greenwood	8,976	204,470
Boundary Falls	5,797	104,489
Trail	4,974	138,961
Nelson	25	10,048
Northport	155	61,762
Marysville	600	19,200
Total	36,370 tons	920,016 tons.

CROW'S NEST OUTPUT.

The output of the Crow's Nest collieries for the week ending Aug. 16 was 22,793 tons, a daily average of 3,799 tons.

New Dividends

NEW DIVIDENDS.

The directors of the Intercolonial Coal Mining Company, Limited, have declared a half-yearly dividend of 3½ per cent. on preferred and 3 per cent. on common, payable Sept. 2. In 1906 the company paid 7 per cent. on the preferred and 7 per cent. on the common.

Catalogues and other Publications Received

The International Metallurgical Company, El Paso, Texas, in a 15-page pamphlet advertise the "W. Townsend Smith Patent Improved Metallurgical and Cyanide Process and Apparatus." In a summary of advantages the following strong claims are made :—

1. A saving of 30 per cent. to 60 per cent. of the installation cost of a cyamide plant.

2. An increased extraction of gold and silver over any other process, with less time of of agitation.

Elimination of stirrers, pumps, etc., saving in labor, large increase of capacity, saving in power, economy of room, elimination of filter presses are also among the good features of this new method. The process is certainly worthy of examination. If the manufacturers are able to substantiate their claims, they need have no fears for their success.

The Illustrated and Priced Catalogues of Assayers' and Chemists' Supplies for sale by the Denver Fire Clay Co., Denver, Colorado, U.S.A., 1907.

This catalogue describes the standard varieties of laboratory apparatus. Of especial interest are the muffles made by this company. Shape 4, with square sides, is a departure from the traditional muffle. Its design implies increased capacity and far greater convenience in removing and placing crucibles. The double-muffle assay furnaces are of particularly strong and simple construction. A fine range of button balances is illustrated.

Catalogue No. 6 C. "Stamp Milling Machinery," issued by the Colorado Iron Works Company, illustrates many types of mortars, and gives a description list of all necessities of the stamp-mill. 12 pages of the publication are devoted to an excellent article on "Gold Amalgamation."

A special catalogue (No. 20) published by the Ingersoll-Rand Company, 11 Broadway, New York, describes the Temple-Ingersoll Electric Air Rock Drill. This new device marks a radical departure from both the standard air drill and the hitherto tentatively accepted electric drill. It is free from the essential limitations of both. Its manufacturers claim that it has been thoroughly "tried out" under actual working conditions. If the machine lives up to its claims it will revolutionize the whole work of winning ore. So far its claims have received substantial endorsation from a considerable number of users in the United States. There will appear in the Canadian Mining Journal further information concerning this machine.

Bulletin No. 10 of the Cleveland Pneumatic Tool Company, Cleveland, O., tells of the "Cleveland" No. 10 and No. 20 Drills. No. 10 will drill holes up to 1½ inches in diameter and 4 feet in depth from six to twelve inches per minute. It weighs 20 pounds and uses 15 cubic feet of free air per minute. No. 20 weighs 23 pounds and requires 20 cubic feet of air. It drills holes up to 2 inches in diameter and 6 feet deep. "Cleveland" drills have no small, easily broken outside fittings, valves or locking devices.

The Tyee Copper Co., Limited.

The eighth ordinary general meeting of this company was held in London last month. The Chairman stated that during the year £12,532 had been spent in prospecting and development, and this and a further sum of £3,321, had been paid out of revenue. Maintenance, repairs and depreciation at the mine and shelter amounted to £4,789, only 10 per cent. having been written off for depreciation as 25 per cent. had been allowed on this account last year. The credit side of the profit and loss account explained itself and enabled the directors to recommend the payment of a dividend at the rate of 7½ per cent. per annum free of income tax. Although the "long looked for ore-body" had not yet been found, the local director, Mr. Clermont Liverston, is still hopeful that the search will succeed; while the company's smelting business had considerably improved from the opening up of copper mines in Alaska, the Yukon Territory and on the Pacific Coast. In view of this improvement the company has under serious consideration doubling the capacity of the smelting works at Ladysmith.

Output of the Dominion Coal Company for July was 312,815 tons, which was 14,000 tons than the output for June. This is how the year's figures look so far:

January	252,107
February	226,190
March	205,134
April	316,114
May	526,170
June	326,914
July	312,815
Total	1,964,494

Output Dominion Coal Co. for the first fortnight of Aug.:

No. 1	20,400
No. 2	26,560
No. 3	15,020
No. 4	20,130
No. 5	28,320
No. 6	8,770
No. 8	9,810
No. 9	10,800
No. 10	3,660
	143,470

The output for the first half of the month was small, several minor delays being experienced. The P. W. A. held their Annual Picnic at Sydney Mines on the 10th August, and the collieries generally paid on the 9th. The amount of money disbursed through the pay rolls was the largest on record both at Sydney Mines and at Glace Bay. During the remaining portion of August the output will continue to improve, and will fully equal and possibly more than equal for the same period of last year.

NEW DIVIDENDS.

The International Coke and Coal Company, Coleman, Alta., has declared a dividend of 1½ per cent., payable August 1st.

The British Columbia Copper Company, Limited, has declared its first regular quarterly dividend of 25 cents per share with an extra dividend of 15 cents per share, payable on September 4th. The company is capitalized at $3,000,000 in shares of $5 each. Of the shares there are 503,000 outstanding. The amount to be distributed is thus $212,000.

METAL ORE AND MINERAL MARKET.

Aluminium, No. 1 grade ingots—45 to 47 cents per lb.
Antimony—9 to 11¼ cents per lb.
Arsenic, white—7½ to 7¾ cents per lb.
Barytes, crude—$11.25 to $14.75 per short ton.
Bismuth, metal—$1.50 to $1.75 per lb.
Cadmium, metal—$1.30 to $1.35 per lb.
Carbons for drills—$75 to $85 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, metal pure—80 cents per lb.
Cobalt, f.o.b. Cobalt, Ont., unrefined—25 to 40 cents per lb.
Corundum—7 to 10 cents per lb.
Feldspar, ground—$12 per short ton.
Flourspar, lump—$10 per short ton.
Graphite, domestic—$50 to $150 per short ton.
Gypsum, lump—$4.50 per long ton.
Infusorial earth, ground—$15 to $30 per ton.
Lead—5.25 cents per lb.
Manganese, pure metal—75 cents per lb.
Mica, ground—$50 to $80 per short ton.
Mica, scrap—$15 per short ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 90 per cent. pure—$4.50 to $5.00 per unit.
Nickel, metal—45 to 65 cents per lb.
Platinum, ordinary metal—$28 per ounce.
Platinum, scrap—$21.50 to $22.50 per ounce.
Pyrite—38 to 45 per cent. sulphur, lump ore, 10¼ to 11½ cents per unit.
Quicksilver—$40 to $41 per 75 lb. flask.
Sulphur—$23 per long tin.
Talc—$18 to $23.50 per tin.
Tungsten, pure metal—$1.25 per lb.
Tunsten ore, 60 per cent. pure—$9 per unit.
Tin—37 cents per lb.

MARKET NOTES.

Spelter—Light demand and weak market. New York, 5.80 cents per lb.; London, £22 7s. per long ton.

Lead—Market steady. New York, 5.25 cents per lb.; London, £19 13s. for Spanish lead.

Tin—Prices still declining. New York, 37 cents per lb; London, £164 10s. for spot.

Copper—More business doing in copper. Market not yet recovered. New York, electrolytic, 18½ cents, lake 19½ cents per lb.; London, £78 for spot standard.

Silver—Aug. 1, 69⅝; Aug. 2, 69¾; Aug. 3, 69⅞; Aug. 5, 69⅞; Aug. 6, 69⅝; Aug. 7, 69⅝; Aug. 8, 69⅜; Aug. 9, 69; Aug. 10, 68¾; Aug. 12, 68; Aug. 13, 67⅞; Aug. 14; 69½.

Mexican dollars—54⅛ cents. Sterling Exchange, $4,865.

Pig Iron—Pittsburg—Bessemer pig, $22.50; No. 2 Foundry, $23.80.

Iron Ore—Bessemer, old range, $5.00; Bessemer Mesabi, $4.75; Non-Bessemer, Old Range, $4.25; Silicious, non-Bessemer, $2.50.

Quicksilver—$41 to $42 per 75 lb. flask.

WANTED

Mining Graduate (McGill) desires a position in Cobalt or vicinity as Superintendent or Foreman with reliable Mining Company. The applicant has had several years in Montana in the practical work of Mining and Concentrating. At present he is Superintendent of a Mining Company.

Address :—"Montana,"
c/o Canadian Mining Journal.

MINING PROPERTIES WANTED.

Prospectors and others wishing to dispose of Mining Claims or undeveloped Mines in Ontario or Quebec, can communicate full particulars to the address below.

The properties will be examined by competent mining engineers, and if satisfactory, arrangements will be made to buy the same.

Address, General Post Office, Box 481,
Toronto, Canada

I WILL GRUBSTAKE

PROSPECTOR and develop the find, if showing warrants. Don't waste your time writing me about ordinary opportunities; I'm deluged with such.

J. B. SPERRY, 18 BROADWAY, NEW YORK.

IRON AND PYRITES CLAIMS FOR SALE

Several undeveloped iron claims and several partially developed pyrites claims, within one mile of line of Canadian Northern Railway, 50 miles west of Fort William; and an undeveloped copper and silver claim near Nipigon, for sale.

Particulars P.O. Box 512, Fort William, Ont.

WANTED AT ONCE.

Young mining graduate with some practical experience to do some work in the province of Ontario. Apply at once to

Fritz Cirkel, M.E., 80 Stanley St., Montreal

FOR SALE

Good mica claim—mica in paying quantity. Also two claims in Temagami, showing Cobalt bloom and giving good assay of silver. Excellent opportunity for investment.

For full particulars apply to

A. Valois, Box 54,
Mattawa, Ont.

FOR SALE

A valuable property of Iron Pyrites in the Township of Madoc, about 1½ miles from the Bay of Quinte Railway. Two veins 11½ feet wide and 6 feet wide respectively of high grade pyrites, averaging 52 per cent. sulphur. Mining cheap. Veins have well defined walls. Mine is on side of high hill.

For further information apply to

S. Wellington, Box 63, Madoc,
Wm. Cross, Box 150, Madoc.

MINING MACHINERY FOR SALE

Splendid opportunity to secure some good machinery far below the price of new and all or any part of it can be delivered on the cars in one week.

One Class D Rand Cross Compound Condensing Duplex Air Compressor having a capacity of 835 feet of free air and will run 10 No. 2 Rand Drills. High pressure steam 14 x 24, low 22 x 24, air cylinders each 14 x 22. Has Myers' patent steam cut off valves and machanically operated air valves. Machine good as new.

One double cylinder, 10 x 16, Lidgerword Hoisting Engine. Drum, 54-inch diameter and holds about 700 feet of wire rope without overlapping. End friction and friction hand break. This machine is as perfect as the day it left the shop.

Lots of Steam Pipe ranging from 2 to 5 inches.
Light Steel Pit Rails about 14 pounds.
Steel Piping Tools from 2 to 5 inches.
One Heavy Duty Steam Mining Pump.
One Northy Duplex Steam Boiler Feed Pump.
Rand No. 2 Rock Drills and Barrs.
Rock Drill Steel ready for machines and in good lengths.
One 15 H. P. Steam Engine.
One 25 H. P. Steam Engine.

These engines would be just the ones for a saw mill or could be used as a pumping engine for a mlne. Steel Ore Car Bodies just the thing for underground work. This lot of odds and ends will be sold low for cash.

For particulars address, G. M. this paper.

ROOFS
That Stay Roofed

The strongest wind that ever blew can't rip away a roof covered with self-locking

"OSHAWA"
GALVANIZED
STEEL SHINGLES

Rain can't get through it in 25 years (guaranteed in writing for that long—good for a century, really)—fire can't bother such a roof—proof against all the elements—the cheapest GOOD roof there is.

Write us and we'll show you why it costs least to roof right. Just address

CANADIAN MINING INSTITUTE.

Secretary's Office and Library:
413 DORCHESTER ST. W., MONTREAL.

Members visiting headquarters are invited to make use of the Institute's offices and reading rooms. The Secretary will also be glad to receive mail matter addressed to members in his care at the above address, and to forward same when required.

Advertise by MAIL

The **ONE** law of all successful business is,—the making known of your wares to the best advantage, at the least cost.

If you have a **GOOD THING** make the most of it,—be universal in your publicity—tell everybody about it,—if it **IS** good, it will sell as fast as it is **MADE KNOWN.**

What better way is there than by making it known **THROUGH THE MAIL.** By this method **THE WHOLE COST** for your introduction to a likely customer is **3½ CENTS.**

3½ cents will cover the cost of

A 2 cent postage stamp; a printed letter head, one color—good bond paper; the additional printing of your copy in the form of an EXACT FAC-SIMILE TYPEWRITTEN LETTER in another color—purple. The insertion of the address, in typewriting to match—in color and type—as the body of the letter.

It also includes the cost of supplying a good quality envelope, with your address printed in the corner—and typewriting the address of your possible NEW CUSTOMER.

All for **THREE AND A HALF CENTS,** of which more than half is for postage.

Gentlemen, have you considered this is your business—a NEW CUSTOMER for LESS than A NICKEL. Let us send you samples of our "hard to tell the difference" FAC-SIMILE TYPEWRITTEN LETTERS, turned out by a new and less expensive process. We give all details gladly if you will write, or 'phone Main 6596.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

SAULT STE. MARIE, CANADA

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers kindly mention this Journal.

Dominion of Canada

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

UNDERWOOD

¶At the Canadian National Exhibition we will have the best exhibit of typewriters ever shown in Canada. It will be of unusual interest of business men who wish to have their office equipment a little ahead of the times.

¶The special feature of the exhibit will be the Condensed Biller, a machine which is indispensible in a business with a large number of accounts; the Retail Bill and Charge machine and the Unit Biller.

¶Be sure to come and see us, and have our demonstrators put you in touch with these great systematizers of office work. They are economizers—of time, labor, money.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8 50. Special to readers of this paper **$5.00**

1 000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper ..... **.90**

500 Working Jackets, of striped moleskin and duck in khaki, brown and slate. Regularly $2.00 apiece. Special to readers of this paper **$1.25**

Underwear, Shirts, etc.

Men's Heavy Scotch Wool and Fleece Lined Underwear, guaranteed unshrinkable, non-irritating, overlocked seams, elastic ribbed cuffs and ankles. Sizes 34 to 46. Regular value, 90c. garment, per garment ..... **.69**

500 Men's Heavy Khaki Duck Mining Shirts, collars, pockets, have patent fasteners, large roomy shirts, wind and rain proof. Sizes, 14 to 17½. Special ..... **.89**

Men's English Cardigan Jackets and Golf Coats, three pockets, guaranteed all worsted, fast color. Sizes, small, medium and large. Regular value $4.00 and $5.00. Each **$2.98**

Men's Heavy Elastic Web Suspenders, strongly sewn, made with unbreakable cast off leather ends, Police-Firemen style. Our price 50c. Each ..... **.39**

Men's Heavy Tweed Shirts with collar and pocket, generously made, double stitched throughout, also a few heavy Mackinaws and black Drills in the lot. Sizes 14 to 18. Regular value, $1.25, $1.50, $1.75, $2 00. Each.. **.89**

Announcement

THE publishers of THE CANADIAN MINING JOURNAL are presently to issue a Souvenir Handbook commemorating the recent visit of the American Institute of Mining Engineers to Ontario. This Handbook will be in every way a complete and appropriate memento of an important event. The cover has been specially designed. The text will embody a synopsis of the proceedings and expressed opinions of the eminent visitors, and historical and descriptive sketches of the mining districts visited. Many half-tones and maps will embellish the reading matter.

The Handbook will appear during September. As the edition will be limited, orders should be placed at once. The price is One Dollar.

COAL MINING MACHINES

Sullivan Air-Driven Pick Machine at Work.

SULLIVAN PICK MACHINES

increase the production of coal per miner, reduce the cost per ton, and secure more lump and less slack than when mining by hand.

They reduce the area to be drained, ventilated and supported, and diminish the danger of blown out shots, since but little powder is needed for blasting.

The positive value motion employed in these machines secures a slow, powerful blow, economy of air, and ease of operation, rendering the Sullivan the most *rapid and efficient Pick Machine in use.*

We manufacture the "AMERICAN" Centrifugal Pumps. These are built in three styles.

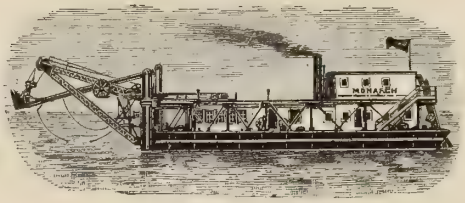
Single Stage Horizontal or Vertical up to and including total lifts of 65 ft.

Single Stage High Pressure horizontal for lifts up to and including 125 ft.

Two Stage High Pressure horizontal for total lifts up to and including 250 ft.

We guarantee at least 25% mechanical efficiency over any other pump of equal size or make, or we can furnish 25% more water with same size of pumps and power than can be procured with any other make of centrifugal pump.

Give us your specifications and we will make you our best prices.



R. H. Buchanan & Co., Montreal, carry our pumps in stock.

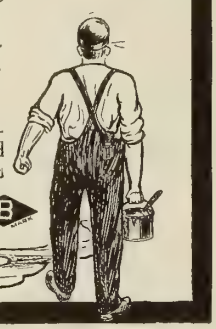
Paint! Paint! Paint!
LeaK! LeaK! LeaK!

There is no reason in the world why you should buy a roof that *needs* painting.

The *need* of painting is *proof* of weakness. It is not the *roof* that protects, it's the *paint*. If you forget to put paint on, or for economical reasons omit doing so, you have a leaky roof; and a leaky roof is always an abomination.

Amatite roofing requires absolutely no painting or coating of any kind during its life. This diagram below tells you why.



You will notice that the top layer consists of a *genuine mineral* surface that will last as long as the roof, and not only makes painting unnecessary, but gives an amount of durability that is remarkable. It saves you the *cost* of paint and the *labor* of putting it on.

If you want the best, most economical and satisfactory ready roofing made, *remember Amatite.*

FREE SAMPLE

Booklet about it and Free Sample will be forwarded at once on receipt of your name and address. This is *proof positive* and you should send for it to-day.

The Mining Manual
For 1907

By WALTER R. SKINNER

A Record of Information concerning Mining Companies (Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, and Exploration Concerns, etc.)

Arranged in Three Sections, **Australasian, African, Miscellaneous,** with Tables of Crushings at ends of Sections, followed by List of Mining **Directors and Secretaries,** their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected; also **Mining and Consulting Engineers and Mine Managers,** with their Company connections, and a **Dictionary of Mining Terms.**

THE MINING MANUAL FOR 1907 contains particulars of no less than 3,100 COMPANIES, arranged in three sections, 450 Companies being AUSTRALASIAN; 1,050 AFRICAN; and 1,600 MISCELLANEOUS (including Siberian, Mexican, Indian, Canadian, American, etc., and the Coal, Iron, and other mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; position at mine and ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts.

The Lists of Directors (over 7,000) and Secretaries (1,750) include their addresses and descriptions and names of the Companies with which each particular Director or Secretary is connected.

A complete Alphabetical Index, including many useful items of reference, occupies 40 pages.

Leading Features of a Good Rock Drill

No. 3.—Patented Adjustable Shell

The Patented Adjustable Shell of the "RAND" Drill is a valuable feature, and is the only practical adjustable shell on the market. By removing one or more of the thin sheet-iron shims and tightening the slide bolts again both top and side wear is taken up. The shims are held by dowels, so that they cannot wear out. On the smaller drills the shells are made of malleable iron, but on the large drills where the shells are subject to greater strains they are made of the highest grade of open-hearth steel castings.

This arrangement of guides assures the maximum of bearing surface whatever the position of the drill. Adjustment is secured by taking-out liners, therefore no extra stock is needed.

STAKING CLAIMS

A subscriber has brought to our notice some irregularities in the staking and recording of claims in Northern Ontario.

In the Diabase Lake District a group of prospectors staked out eight claims of forty acres each, not only before making a discovery upon the territory so staked, but before they had even prospected the ground. The average prospector will not interfere with areas which have been staked. Therefore this particularly vicious form of blanketing practically secures large holdings in defiance of the express and explicit requirements of the law.

In James Township, claims thrown out by the Government Inspectors have been promptly recorded by other parties, who have dispensed with the preliminary necessity of prospecting and have sworn to fictitious discovery. This last practice is far too common.

We quote the above instances because we believe that the honest prospector should assuredly have fair play. There are many men who cannot bring themselves to swear to an imaginary discovery. These men suffer for the sins of less scrupulous persons. A few prosecutions for perjury would clarify the situation.

PROSPECTORS' MEETINGS

From several quarters has come the request that we should give more of our space to the prospector. The request is fair, but the prospector himself is elusive. His elusiveness exceeds our willingness to comply with his desire. Our columns are always open to the complaints or questions of the prospector. We hold him in especially high esteem, for we know something of him.

His grievances are largely based upon those features of our mining laws which, in his opinion, militate against him. From Ontario we have had many verbal complaints —from Quebec a greater number, couched in language more vehement.

We wish to proffer a suggestion. It would be an excellent thing if, in places like Sudbury, Cobalt, Marmora in Ontario, and suitable points in Nova Scotia, Quebec, Alberta and British Columbia, gatherings of prospectors could meet and discuss the mining laws of each Province. In the laws of every Province there are bad and good features. In Nova Scotia and British Columbia the prospector has, perhaps, the fairest treatment. In Ontario, while the administration of the law is honest, discreet and equitable, yet the law itself gives rise to some anomalous and distressing complications. But the Government has openly professed its willingness, its real desire, to improve and simplify the present Mines Act. The

growling of sore-headed individuals does no good. What is needed is the clear expression of opinion from a representative gathering of prospectors.

We would suggest then, as an opening move, that during the coming fall a meeting of prospectors be held at Cobalt or Haileybury. A convenient time would doubtless be after the first fall of snow. A meeting of this kind would clear the atmosphere. Resolutions drafted by a company of bona fide prospectors would receive most respectful consideration from the Provincial Government. We predict also that at least half of the grievances now current would evaporate.

AN IRON INDUSTRY FOR BRITISH COLUMBIA.

The flotation of an organization, to be capitalized at $15,000,000, is being undertaken by British financiers. The erection of large iron and steel works, with many subsidiary plants, will follow the successful promotion of the company.

If the promoters are thoroughly in earnest—and there is no reason to suppose them otherwise—they will, doubtless, receive all possible encouragement and support from the Province. A sound and progressive iron and steel industry is more to be desired than mountains of silver and gold. To British Columbia it would impart a stability not otherwise obtainable. When our Pacific Province becomes self-supplying in the items of coal, iron and steel, she will have added many cubits to her stature.

COBALT AND OTHER THINGS

The depreciation in Cobalt stocks is significant of two movements. Firstly, the public is fast losing confidence in many of the more heinous flotations, and as a consequence the mining broker's calling and election are sure no longer.

Secondly, a strong reaction is setting in at Cobalt itself. Prospects and mines that were merely started as pretexts for profitable promotion are rapidly finding their level—and it is a low level. The sounder enterprises are pushing vigorously ahead. The true test of "results" may very fairly be applied now to all but the most recently staked properties.

Incidentally there is a most apparent tendency towards the promotion of smelters and reduction plants. Apart from plants erected by private enterprise, there are several proposed smelters whose promoters have appealed or will shortly appeal to the public. In subscribing for stock of this sort every precaution should be used. The reduction of Cobalt's ores will not be a simple process. Much time and money will be spent before their treatment will have been standardized. Therefore it is but ordinary discretion to look askance upon the large promises of any proposed smelting concern.

A PAINFUL DUTY.

The activity of promoters of mining companies, especially in Cobalt and Larder Lake, has been most pronounced of late. Strong efforts are being made to dispose of stocks whose value is problematical, if not quite negative. The Canadian Mining Journal believes that it will best serve the interests of the districts mentioned and of the public, if, taking available facts and prospectuses as a basis, comparisons are instituted between the promises and the performances of these promoters.

In the course of our enquiries we have discovered that many companies have either not complied with or have evaded a large number of the requirements of the Companies' Act of Ontario. These omissions we shall point out. We shall also state without fear or favor our unqualified opinion of various flotations.

It is a most distasteful duty. But a duty it most undeniably is. We owe it to our subscribers, for the benefit of whom we live and move and have our being.

The current number contains the initial article of a series, which, we hope, will lead to a new interpretation of the obligations of the promoter to the public.

EDITORIAL NOTES

Errors creep into our columns despite our honest and painstaking efforts to eliminate them. In the last issue Dr. Haanel was referred to as Director of the Mines Department. This is inexact. Dr. Haanel is Director of the Mines Branch. A letter published in this issue sets the matter right.

The Secretary of the Toronto Branch of the Canadian Mining Institute announces that there will be a meeting of the members of this branch on Thursday evening, October 10th. The place of meeting will be announced later. The object of the meeting is the discussion of the Mines Act and the drafting of recommendations as to changes in certain sections of the Act. The recommendations are later to be respectfully submitted to the Minister of Mines for Ontario.

The world still has a considerable supply of coal. Germany is credited with 28,000,000,000 tons, sufficient to last 2,000 years at the present rate of consumption; Great Britain and Ireland claim 193,000,000,000 tons, with an annual consumption about double that of Germany; Belgium has 28,000,000,000 tons; France, 19,000,000,000; Austria, 17,000,000,000; and Russia, 40,000,000,000. North America is believed to have 681,000,000,000,000 tons, more than the total of the other countries named. It is the tremendous increase in the use of coal that justifies alarm, for, while the supply of the United States would last 4,000 years at the rate of consumption in 1905, it will be exhausted within a century if the rate of increase of the last 90 years continues. No estimates of the coal of other parts of the world can be made, but Asia is known to have an enormous store.

SPRINGHILL AND ITS COLLIERIES.

W. D. Matthews.

Before entering upon a description of these collieries, it may not be out of place to give some idea of the lay of the coal seams at present being worked. There are three seams, viz., north, east and west, or as numbered, 3, 1 and 2. No. 3, the overlying seam of the series, is separated from No. 1 by 300 feet of intervening strata. No. 1 is separated from No. 2 by about 100 feet of rock, No. 1 coming in between 2 and 3. The seams run parallel, though differing greatly in places, as to dip, this difference running all the way from 20 degrees to 80 degrees. The Cumberland coal field is an extensive one. Coal has been found all over the country. It is generally conceded, however, that the Cumberland Railway & Coal Company has the best of it. Outside of their holdings it is doubtful if the remainder possess any great value. Just how many seams of economic value there are in the Springhill basin is a matter of conjecture. Exhaustive prospecting has been done over this section by some of Canada's best known engineers, surveyors and geologists, and much has been written, worthy of reading, about the

No. 2 Colliery—Town of Springhill in background.

Cumberland coal fields, but the findings, so far as the writer knows, have never been particularized. The Cumberland Railway & Coal Company is operating the three known largest seams from two slopes. No. 3 seam, 11 feet high to the west of the main slope, which is split by a local stone, gradually thickens towards the east from the main slope till in two thousand feet a tunnel one hundred and fifty feet is required to connect them. No. 1 seam is similarly split to the east. The height of this seam is identical with that of No. 3. No. 2 seam is more uniform in height, varying but two feet from east to west, embracing some three miles of workings across seam. The highest, 10 feet 6 inches, which includes two-thirds of the entire length of the level.

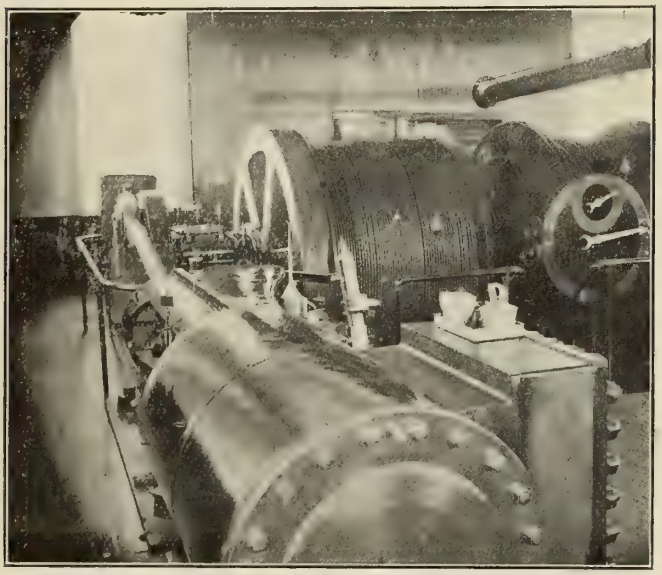
The north, or No. 3, the overlying seam of the three, is a very excellent seam of coal, except to the extreme west of the mine. The coal is hard, clear and bright, rich in carbon, carrying a low percentage of ash with an infinitisimal quantity of sulphur. To the west this seam maintains a height of 11 feet to the boundary, nine thousand feet west of the main slope. The east lines do not reach so far. The system adopted in working this seam is bord and pillar. There is a method pursued in this mine, and in the other in a measure, not usual in mining as a rule. Levels are driven off slope at a distance of two hundred yards to the deep. The upper level is driven to the boundary, which in this case is recognized as the limit of haul. The back airway is then driven to connect with the return airway above. A pillar 30 yards thick is left to protect this air course. Then, by bord and pillar working back towards the slope, the whole lift is cleaned out, leaving but a worked-out goaf behind. This method has been very successful over some of the most difficult ground that ever confronted miners, or operators. The pitch of the seam ranges all the way from 45 degrees to vertical, with frequent faults and rolls throughout the entire section. While the upper lift is being drawn, the lower levels are being driven to the boundary. When this is reached the lift is worked back to the slope by the same system, so that there is always one or more lifts being worked back while the lower levels are being driven in. The following figures will some idea of the extent of

No. 2. Slope.

the workings in this mine. The present highest working level is 2,600 feet from the surface. It extends west 9,180 feet—seam 10 feet to 11 feet high. East levels, under seam, 2,745 feet. East level, top seam, 2,160 feet. The lift below 3,200 feet from surface level extending west 9,420 feet. East level under 2,280 feet, viz., 11 feet west and 4 feet 6 inches each of the east seams, or simply the west section of seam split by an intervening local stone.

The 3,800 foot level is practically untouched, except by the cutting of airways and haulage ways. The levels are now in over 6,000 feet. The upper level will be the main airway and drainage level. These levels are still driving. The slope in the meanwhile being sunk for a new and greater lift. It has now reached a depth of 4,500 feet, and 250 feet further is to be added before the levels are broken away. This will give a thousand foot lift. This lift with level driven to the limit of 9,500 feet gives 9,500 x 1,000 feet x 10 feet, or approximately three and a half million tons of coal in the west from the opposite or east section in this one lift.

The 2,600 and 3,200 levels west are operated by main and tailrope haulage. The haulage engines is located at 1,300 feet from the surface and steamed from the sur-



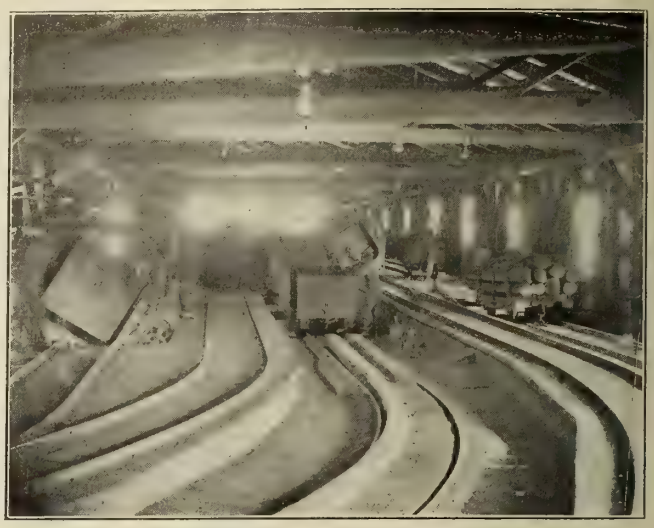
face. The east levels and west 3,800 feet are worked by horses, the number of which working at present is 22.

This mine is kept free of water by two pumps, known as the Jeansville Compound Duplex, eight hundred gallons per minute capacity, situated 1,300 feet and 3,200 feet from the surface respectively. As almost the entire drainage of the mine is caught at 3,200 feet, a small Cameron pump is used to keep the mine clear of water in the lower sinkings.

To ventilate this mine a Capell Fan 22 feet diameter, 3 feet 6 inches width of vane, with a checked capacity of 110,000 cubic feet per minute; speed, 110 revolutions, is used.

The above is the work done for ventilating purposes daily, and gives a wide margin beyond the theoretical necessities of the mine. The number of men employed is 450. The mine is not gaseous to any dangerous extent, but closed lights (safety lamps) are the rule. The Marsant is used exclusively throughout these collieries. The system of ventilating is simple but effective. No better ventilated collieries are known on the continent to-day.

The surface plant of No. 3 mine is almost perfect in its equipment. The bankhead is a model of engineering



No. 2 Hoist Engine.

skill and ingenuity. There we find automatic hoists for full and empty cars, incline plants to carry the cars to certain points, automatic switches, revolving tipples, shaker screens, picking tables 450 feet in length, which carry the coal from the screens to railway cars, allowing every facility for thoroughly cleaning the coal in transit. These are capable of handling 3,000 tons per day if necessary. The whole outfit is enclosed in a corrugated iron building, and lighted by electricity. The power to move this machinery is provided by 12 boilers of the return tubular make, capable of generating 1,500 horsepower, equipped with automatic underfeed stokers, 2 Sturtevant blowers with 39 pounds pressure to the square foot. Culm is used here for firing, with good results.

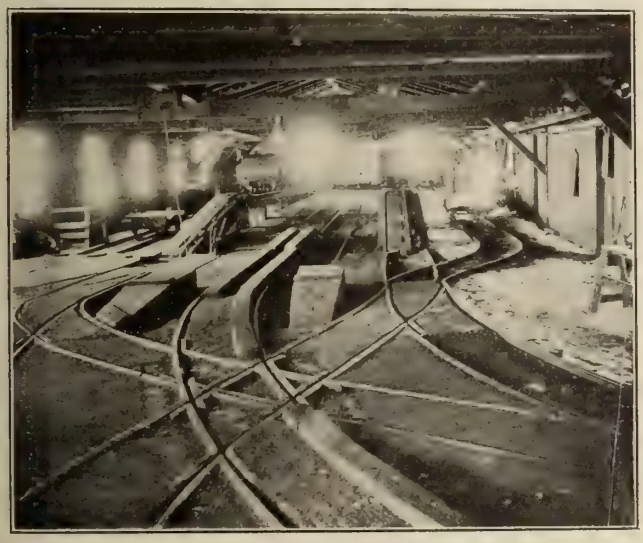
No. 2 Mine—West Slope.

In the effort to describe No. 2 mine, one must needs have the bump of location very highly developed. As all the coal in seam, that is to the recognized boundaries east and west, has been extracted above the 1,900 foot lift, the visitor will find the main working bottom located 2,400 feet from the surface. The east level of this lift is worked by main and tailrope. That is, the coal from the workings is conveyed to the bottom by this method of haulage. The length of haul is 5,000 feet, the return

No. 3 Bankhead in Operation.

wheel being placed at the Aberdeen Fault, which dislocates the seam at this point, and which runs nearly parallel to the course of the main slope. Although there are two inclines, and several chutes working between the Fault and the bottom, yet the largest quantity of coal is brought by horses to the inside haulage turnout from the Aberdeen section. This section extends east from No. 5 or Aberdeen slope 400 feet to the tunnel through the fault which connects No. 2 haulage level with the Aberdeen section.

To the west of No. 5 slope the level extends 5,500 feet. Horse haulage was always employed on this level to convey the coal to connect with haulage in No. 2 slope. The quantity of coal mined east and west of No. 5 is supplemented by the coal produced in No. 5 sinking. A hoisting engine on the surface at No. 5 hoists No. 5 sinking coal to the 2,400 foot level and lands it there, whence it is hauled to No. 2 section and sent out by the rope haulage system. In the mere development of No. 5 sinking, about 500 cars of 1,800 pounds each were producer. This



Interior of Lamp House.

coal comes from the so-called halfway level east, which extends 5,000 feet and is still being driven as a counter-level 60 feet to rise of level with necessary returns airways to 2,400 level. The lower level has been driven

from No. 5 slope some 3,000 feet. The plan of the workings is the same as above.

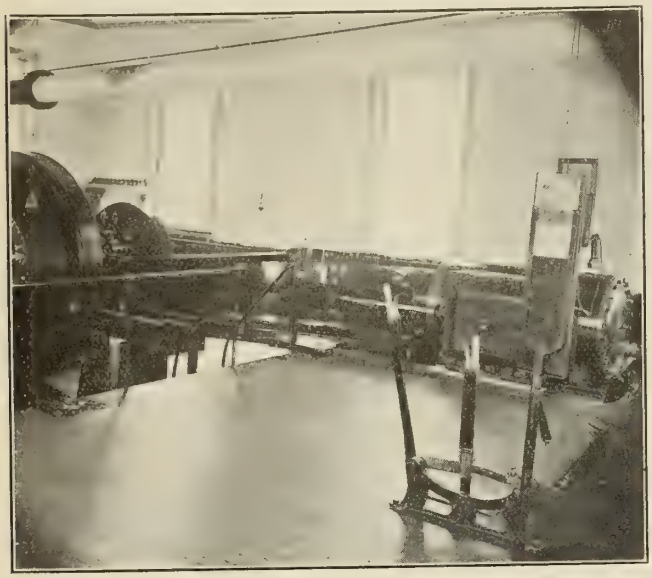
To the west of the halfway level is a tunnel tapping two seams. The levels extend east and west from this tunnel in each seam. The levels are being driven and other openings for ventilation are being made. This section is known as the tunnel-working halfway level. The tunnel is some 230 feet long, both seams being cut in that distance. The west lower level, No. 5, extends to No. 2 slope, 3,500 feet distant, and taps or connects with the main slope, some 200 feet from the bottom. It has lately been connected with No 2 east level by incline, by which the coal has been taken over No. 5 district and landed at the 3,600 foot bottom of No. 2 slope, a saving of haulage of two miles underground.

The clearing and sinking of No. 2 slope from the 2,400 foot level down to the present 3,600 foot level presented difficulties seldom met with in coal mines. Fifty feet below the 2,400 foot level a roll was met with that necessitated a rock cutting, after the coal was removed, of 15 feet at the highest point, and extending 200 feet down the slope. This still left the difference of grade between the length of cutting and the slope above and below it of from 8 degrees to 10 degrees. The cutting being flat in comparison, was later brought near the average grade of

No. 3 Brow of Slope.

32 degrees, by a further cutting of 4 feet out of the bottom, tapering out to a greater distance. This made the hoisting of heavy rakes possible. Before the work was quite finished a fire occurred in No. 1 slope, then working (1896-97), which put the pumps of No. 1 out of service. Nos. 1 and 1 being connected, the new section below 2,400 feet was submerged. Pumps were installed in No. 2 slope below 2,400 feet in short order, and the water was caught and held there for some years. In the spring of 1903 the work of pumping out and re-opening the submerged lower workings was begun. When the water was pumped out it was seen what a colossal undertaking it was. Falls were encountered anywhere from 10 to 50 feet high. The first fall encountered was about 80 feet long and 40 feet high on a grade of 32 degrees. Everything loose had to be loaded out, making the work extremely dangerous and slow. But experience, ingenuity and care, with unlimited material of the best quality, finally accomplished the stupendous task, without the loss of a single life. Pumps were installed at the 300 foot lodgement, which fortunately was found standing intact (except for a few insignificant falls, which were speedily cleaned up), and sinking at once proceeded below the 3,000 foot level. One hundred and twenty-five feet was sunk, when a downthrown fault was struck, displacing the seam by a drop of 30 feet vertical. A tunnel was driven down through the rocks at an angle of 52 degrees, striking the coal at 90 feet below the fault. Here it was found that the seam had flattened to 24 degrees of pitch, necessitating the blowing down of top rock for 250 feet, reaching the highest point midway at a distance of 30 feet. But the expenditure of time, labor and money was well warranted by the opening up of this magnificent seam of coal. The quality at this depth really available was 5,000,000 tons. The seam runs down 10 feet to 11 feet in height and clean from roof to pavement. The lower lift of this mine is now being rapidly developed with strict attention to its future. Everything is put to stay. The surface plant of this mine is equal to the limit of output.

The bankhead is built in the shape of a horseshoe, making a space of 320 feet from slope to tipples. The full cars from the mine are carried around the slight grade, there they are caught and guided to the tipples, of which there are both sorts, revolving and end tipples. The coal goes over shaker screens and is spread on moving picking tables, when it is thoroughly cleaned by a number of boys and men before being put in cars.



There are three such screens and tables, capable in the aggregate of handling 2,500 tons per day. The empty

No. 3 Colliery.

cars when drawn from the tipples are guided to the hoist, where they are passed to an elevator and of their own weight run by a carefully graded road to the pit brow, where the empty rake of 12 cars is made up to return to the mine. The hoisting engine is an exact duplicate of No. 3 hoisting engine, and is set well back from the bankhead buildings. This was necessary as the present is the fourth site it has occupied in making room in past years for bank extension. The engines, which are powerful looking machines, are bedded on solid concrete foundations, and appear equal to any work required. Technically described, they stand one pair 30 inch by 48 inch, direct acting, link reversing, hoisting engines, with grooved drums, 7 feet in diameter, 5 feet face each. The drums hold 6,000 feet of 1 1-2 inch steel wire rope. The fan to supply air to this mine is as at No. 3 mine, a Capell double acting blow-down with a capacity of 150,000 feet per minue, 10 inches W. G. Its size is 15 feet in diameter, 5 feet width of vane. In close proximity to this mine is the lamp station. Here 1,200 safety lamps are cleaned, oiled and tested daily by the small force of two men and a boy. Here also, steam, compressed air and electricity are brought into requisition. As a result we see the marvelous celerity with which lamps are turned out for use in the mine. The building is entirely of

brick and concrete with cement floors. The interior of the building is immaculate with paint and polish. There are but three apartments, the lamp room, repair shop and office. Within a few feet of the station is the electric power house, also a brick edifice, elaborately finished

No. 2 Engine House.

in hardwood and enameled iron works. In the interior here again paint and polish keep the building and machinery ever clean and bright. Two generators, each of a capacity of 1,200 volts, provide light for all purposes on the surface, bankheads, screens, boiler houses, engine houses, machine and blacksmith shops, all offices and places where a light is at all necessary, together with all approaches to the mines. Railway arc lights are used for the latter purpose, making the scene at night around the works a very brilliant one. Situated between the two slopes, Nos. 2 and 3, is the fire engine. It is the Northey Underwriters' pump, size 16 inches x 9 x 12 inches. It is capable of pumping 750 gallons per minute with a pressure of 100 pounds. This is, however, rendered of less consequence, now that the works system is connected with the town system of waterworks, which gives 80 pounds pressure by gravity. But nevertheless the engine is kept in beautiful order and ready for any emergency. In connection with the pump there are about the works 12 hydrants, 2 hose reels, with 2,000 feet of 2 x 2 1-2 inch hose. Some 3,500 feet of 6 inch pipe connect the various points of the works together with various smaller branches.

To move all machinery in connection with No. 2 mine (in which must be included two large and one small duplicate Jeansville pumps, one large Blake and one large Cameron pump, as auxiliary to the Blake pump) is a battery of twelve boilers, which include four Mumford, two Lancashire and six McDougall return tubular boilers, capable of generating 1,500 horse-power, all under one roof. The building is of masonry and corrugated iron and presents a very clean appearance. Four large brick stacks furnish draft for the furnaces, which are all hand-fired. The fine culm off the screens is used with best results. A telephone system is in use which connects all points of importance above and below ground with the offices and houses of all heads of departments. It takes care and strict attention to keep the system, especially the mine section, in order. But it is without question care and attention well spent.

THE BIG BEN COBALT MINES, LIMITED.

CHAPTER I.

For some time it has been the intention of THE CANADIAN MINING JOURNAL to deal with certain Cobalt and Larder Lake flotations. The difficulties in the way of doing this are obvious. At one stage and under some conditions more harm than good would result. Just now, however, circumstances have arisen which make it manifestly our duty to show the public, so far as in us lies, the difference between what they think they are buying, what they are told they are buying and what they actually are getting. We propose to take up one by one many companies operating in Canada. It will be of assistance to us if such of our subscribers as have purchased shares in mining companies will send us copies of prospectuses, and, at the same time, give us all general and specific information obtainable. Let us now to business.

(1) We have before use the prospectus of the company whose name appears at the head of this article. From this we glean the following statements: The Big Ben Cobalt Mines, Limited, was organized in Toronto on January 18th, 1907. It is incorporated under the laws of Ontario, and has an authorized capital stock of $2,500,000, divided into shares of $1 par value each; all issued as full paid and non-assessable. No personal liability.

(2) Under the caption "Financial Condition" we are told that Big Ben owns 500,000 shares of its capitalized stock, has a guaranteed working capital of $50,000, owes no debts, is not involved in any litigation and has a clear title to its property. Its property consists of about 33 acres in lot 13, concession 1, Township of Bucke, District of Nipissing.

(3) Upon farther perusal we learn that the Big Ben adjoins the Green-Meehan Mine on the east, corners with the Red Rock Mine to the southeast, the Latchford on the northeast, the McConnell on the south, and the Von Hagen on the north.

(4) Next we notice under "Engineers' Reports" that Lucky Scott, of Pioche, Nevada, described as "the well-known mine owner, operator and engineer," has recommended the property very highly. Mr. Scott enclosed in his report an assay certificate from Thos. Heys & Son, certifying that certain samples, which Mr. Scott says were taken by himself on the property, contained of silver 4,127 ounces, 15 dwts, 16 grains per ton, a value of $2,889.42 per ton. Again, R. M. Holden, M.E., "the well-known mining engineer of Cobalt, Ont., who first reported favorably upon the Green-Meehan," is quoted as saying of certain Green-Meehan and Red Rock veins, "*They must enter this lot,* and besides these veins which I have described, I can see no reason why other rich veins will not be found in other portions of *this favorably situated lot.*"

(5) The management of the company is vested in a board of nine directors, who are all active business men,

and who will safeguard in every way possible the interests of all stockholders. Active development is promised, and the Union Trust Company, Limited, of Toronto, Ontario, is specified as registrar and transfer agent.

The officers and directors are the following gentlemen:—

OFFICERS.

President—C. E. Slater, Esq., Montreal.
Vice-President—W. F. Dineen, Esq., Toronto.
Secretary-Treasurer—J. A. Goodearle, Esq., Hamilton.

DIRECTORS.

C. E. Slater, Montreal.
W. F. Dineen, Esq., Toronto.
H. C. Barker, Esq., Toronto.
D. McCall, Esq., Toronto.
J. A. Phin, Esq., Toronto.
F. B. Allan, Esq., Toronto.
P. McCool, Esq., North Bay, Ont.
F. D. Mackay, Esq., Toronto.
J. A. Goodearle, Esq., Hamilton.

Let us now consider the statements, claims and promises of Big Ben Cobalt Mines, Limited, *seriatim*:—

(1) *Capitalization.*—Big Ben owns about 33 acres of ground, upon which not one vein of high grade ore has been cut. The capitalization of the company is $2,500,000. It is therefore not unfair to characterize this as excessive, as unbusinesslike and as foolish.

(2) *Financial Condition.*—Of the 2,500,000 shares, Big Ben owns 500,000 shares, which it holds as treasury stock, and which are, at time of writing, untouched. Therefore the revenue from the shares that have been sold, apart from paying for the property, has not gone into the coffers of the company, except to the extent of $50,000. Even this is not necessarily paid in. The prospectus designates it "guaranteed working capital. We have no means of ascertaining the nature of the guarantee given, nor how much of the money has been expended in construction and development. On the other hand, it would seem to us that $50,000 out of $2,000,000 of capital placed, is an absurdly inadequate sum to appropriate for the development of a mine which is expected to give returns on such a large capitalization. We must emphasize here that the stock which has been sold is not treasury stock (the proceeds of which would naturally go to development); but the holdings of some private individuals, assigned them for reasons not specified in the prospectus. Also we must draw attention to the slender chances which the treasury stock will have when thrown upon a market that has already digested 2,000,000 shares of private holdings.

(3) Under this section are gathered the principal claims upon which Big Ben bases its capitalization, and its appeal to the public. It adjoins the Green-Meehan, it "corners with" Red Rock and in various ways it compromises itself with sundry other properties. These are all interesting facts; but hardly relevant or scarcely significant enough to warrant a $2,500,000 capitalization. Proximity to, even contact with, valuable properties is a decidedly dubious asset, especially in Northern Ontario.

(4) Fourthly we come upon "Engineers' Reports." Mr. A. W. Scott, called by his familiars "Lucky" Scott, of Pioche, Nevada, is quoted to the extent of six lines. And in those six lines Mr. Scott makes statements that have, at best, a merely speculative value and are clothed in language not commonly used in the reports of responsible mining engineers. We know nothing of Mr. Scott, professionally or otherwise. But we observe with pain that he lays himself open to grave misrepresentation. To his "report" he appends a signed assay certificate from Thos. Heys & Sons. To the best of our knowledge this certificate so placed is entirely misleading. Mr. Scott may have acted in all honesty. But the fact remains that not one high grade vein has yet been discovered on Big Ben. Therefore, until we receive further light, we must conclude that Mr. Scott was entirely ignorant (and in this he is not remarkable!) of the art of sampling. The assay returns, of course, indicate ore from a very rich vein. Thus either the sampler was ignorant or the sample was picked. The chemist has no responsibility in this. He merely analyzes and reports upon the sample given him.

A short digression may be permitted here. We have before referred to the misuse and abuse of assay returns. Let us reiterate. Such returns should be absolutely disregarded unless the whole history of the sample is given. The name of the sampler, his methods of sampling, the exact spots sampled, the conditions of shipments, all these should be specified. Neglect of these precautions at once vitiates the certificate. Usually the chemist or assayer is quite powerless to prevent the ignorant or fradulent misuse of his certificate. It is at this point that legislation is needed, and needed badly. We have had many instances of direct misrepresentation brought to our notice. Usually, however, the misrepresentation is skillfully indirect. Occasionally it is due to sheer ignorance. But in most cases it can be attributed to the clear intention of getting into the pockets of the gullible. In this respect Big Ben is by no means as bad an offender as are some other companies, whose standing it will be our duty to examine in forthcoming issues.

(5) Both the prospectus and a florid pamphlet accompanying it, dilate upon the character of the directorate. "The management," we read, "is vested in a board of nine directors." All of these are active business men "who will safeguard in every way possible the interests of the stockholders." How will these cheerful asseverations stand analysis?

Of the directors, whose names we have given above, not one is a mining man. In all charity we must allow this statement to stand unqualified.

Not for a moment would we question the integrity of any of these gentlemen. But of their knowledge of legitimate mining we are forced to entertain grave doubts. Would one of these directors lend his name to a manufacturing concern whose capital stock had been handled like Big Ben? Whose chances of making returns were as uncertain as Big Ben's? We think it hardly probable!

Also in what manner have these directors safeguarded the interests of possible shareholders? One need but glance over the previous comments to find that shareholders have little or no chance whatever to reap any financial benefit from their investment.

We are weary of reading the names of respectable merchants, lawyers, manufacturers, politicians, ministers of the Gospel and even (and this is the ultimate of indiscretion!) otherwise reputable mining engineers on promoters' literature. In any or all of these classes the willingness to become guinea pigs is indicative of gross ignorance, or of unjustified cupidity. And, conversely, it is surely time that the public realized that pre-eminent respectability of a board of directors does not constitute a mine.

In the particular case of Big Ben we believe that the members of the directorate are all honorable and responsible men of affairs. It follows then that they are identified with this promotion through ignorance of what such flotations imply. After they have thoughtfully perused this article they will no longer wish to be classed as ignorant. Therefore we may without hesitation predict that Big Ben will either go out of business or else its stock will be thoroughly dehydrated, its capitalization reduced to a sane figure, and a full account of all shares allocated and all moneys expended, given to all its shareholders.

Before concluding this chapter it is necessary to advert for a moment to the pamphlet (referred to above), which accompanies the prospectus.

To encourage the hesitating purchaser a few instances of successful Cobalt mines are given. "Temiskaming and Hudson Bay, "the pamphlet asserts, "was first offered at 40 cents per share—has paid its stockholders $92 per share in dividends and is now selling at $190."

This is perfectly true. But no more damning evidence of Big Ben's unworthiness could be adduced. The Temiskaming & Hudsoy Bay is capitalized at $25,000, of which only $8,110 is placed. Further comment would be superfluous. This and the other features emphasized, including the respectability of the directorate and the optimism of Mr. Scott are surely as undignified as they are irrelevant. A good mine need never advertise its merits.

CHAPTER II.

Another feature of company promotion and flotation to which we would like to call the attention of the public and the Provincial authorities, is the non-compliance with or evasion of the provisions of the Companies' Act.

According to the Companies' Act of Ontario, every company incorporated in this Province which has a number of shareholders greater by ten than the number of applicants for incorporation; or any company incorporated elsewhere, which has more than ten shareholders in Ontario, is required to file a copy of every prospectus issued. "No prospectus shall be used until so filed, and every prospectus shall state on the face of it that it has been so filed."

The Act further provides that "Every prospectus issued by or on behalf of a company or in relation to any intended company or by or on behalf of any person who is or has been engaged or interested in the formation or promotion of the company shall state:—

(A) The names, descriptions and addresses of the original incorporators, and the number of shares subscribed by them respectively;

(B) The number of shares, if any, fixed as the qualification of a director, and any provision in the by-laws of the company as to the remuneration of the directors;

(C) The names, descriptions and addresses of the directors or proposed directors;

(D) The minimum subscription on which the directors may proceed to allotment and the amount payable on application and allotment of each share;

(E) The time or times at which, under the by-laws of the company a further call or calls may be made upon shares subscribed for;

(F) The number and amount of shares issued or agreed to be issued, as fully or partially paid up, otherwise than in cash and in the latter case, the extent to which they are so paid and the number and amount of bonds, debentures or other securities issued or to be issued and allotted to any person;

(G) The names and addresses of the vendors of any property purchased or acquired by the company, or proposed to be purchased or acquired, which is to be paid for wholly or partly out of the proceeds of the issue offered for subscription by the prospectus or the purchase or acquisition of which has not been completed at the date of publication of the prospectus, and the amount payable in cash, shares, bonds, debentures or other securities to the vendor, and where there is more than one separate vendor, or the company is a sub-purchaser, the amount so payable to each vendor;

(H) The amount (if any) paid or payable as purchase money in cash, shares, or debentures for any such property as aforesaid, specifying the amount payable for good-will;

(I) The amount (if any) paid or payable as commission for subscribing or agreeing to subscribe or procuring or agreeing to procure subscriptions for any shares in the company or for underwriting or procuring underwriting of any securities issued or to be issued by the company or the rate of any such commission;

(J) The amount or estimated amount of preliminary expenses;

(K) The amount paid or intended to be paid in cash, shares, or debentures to any promoter and the consideration for any such payment;

(L) The dates of and parties to every material contract and a reasonable time and place at which any material contract or a copy thereof may be inspected; providing that the requirement shall not apply to a contract entered into in the ordinary course of business carried on or intended to be carried on by the company, or to any contract entered into more than three years before the date of publication of the prospectus;

(M) The names and addresses of the auditors (if any) of the company;

(N) The full particulars of the nature and extent of the interest (if any) of every director in the promotion of or in the property proposed to be acquired by the company, with a statement of all sums paid or agreed to be paid to him in cash or shared by any person, either to qualify him as a director or otherwise, for services rendered by him in connection with the formation of the company.

The Act further states that every provisional director, director or other person responsible for the issue and publication of such prospectus shall for every violation of the provisions above quoted be liable on summary conviction to a penalty not exceeding $200 and costs.

The Act further states that "Where, after the passing of this Act a prospectus or notice invites persons to subscribe for shares or debenture stock or security of a company, every person who is a director of the company at the time of the issue of the prospectus or notice, and every person who having authorized such naming of him is named in the prospectus or notice as the director of the company or as having agreed to become a director of the company, either immediately or after an interval of time, and every promoter of the company and every person who has authorized the issue of the prospectus or notice, shall be liable to pay compensation to all persons who shall subscribe for any shares, debentures or debenture stock or other security on the faith of such prospectus or notice for the loss or damage they may have

sustained by reason of any untrue statement in the prospectus or notice or any report or memorandum appearing on the face thereof or by reference incorporated therein or issued therewith, unless it is proved that having consented to become a director of the company he withdrew his consent before the issue of the prospectus or notice or that the prospectus or notice was issued without his authority or consent, and that on becoming aware of its issue he forthwith gave reasonable public notice that it was so issued without his knowledge or consent, and before allotment thereunder he on becoming aware of any untrue statement therein withdrew his consent thereto, and caused reasonable public notice of such withdrawal and of the reason therefor to be given.

The Act further specifies that the word "prospectus" shall mean any prospectus, notice, circular, advertisement or other invitation offering for subscription or purchase any shares, debentures or other securities of the company, or published or issued for the purpose of being used to promote or aid in the subscription or purchase of such shares, debentures or securities, and the word "company" shall mean any company incorporated or proposed to be incorporated.

Let us see how the company with which we are dealing has complied with the provisions of this Act.

Before writing, we visited the Provincial Secretary's office and asked to be shown all papers and documents filed in connection with the Big Ben Cobalt Mines, Limited, and the Sovereign Securities, Limited, which latter company is securing from the public subscriptions to the stock of the Big Ben. We find that the Big Ben Cobalt Mines, Limited, was incorporated on the 18th of January, 1907, but up to the time of our search, namely, 27th of August, 1907, no prospectus had been filed. The Sovereign Securities, Limited, was incorporated on June the 19th, 1907, with a capital of $100,000 in shares of $100 each. The provisional directors of this company are as follows: Jno. Ernest Cunningham, Elbert Ed. Knox, and Arthur Cohen. No prospectus of either Big Ben or the Sovereign Securities had been filed by the Sovereign Securities Company.

Now let us examine how the prospectus of the Big Ben, which we have before us, and on which subscriptions have been solicited and no doubt secured from the public, complies with the requirements of the Act.

Of the fourteen specific requirements only one is complied with in the prospectus issued by the Big Ben Cobalt Mines, Limited. That one, (C), requires the names, descriptions and addresses of the directors or proposed directors. It is probably the least important and is certainly the easiest with which to comply.

The Big Ben prospectus omits some very essential information. Requirement (G) is entirely ignored. Nowhere, also, can we find mention of the amount or estimated amount of preliminary expenses. The promoters' remuneration is not specified.

The amount paid or payable as purchase money in cash, shares or debentures for the property, and the amount payable for good-will, are of very vital importance in the organization of such a company. The organizers are expressly commanded by the Act to include this information in the prospectus. Yet Big Ben's prospectus says not one word on these points. But there is no need of multiplying words. The Companies' Act, especially in its references to mining companies, was framed as a restrictive measure. *Per se* it is an excellent piece of legislation. Unenforced it is as meaningless as a collection of Limericks. Its strict and prompt enforcement will save the Province trouble and Cobalt many smirches upon her good name.

ANKYLOSTOMIASIS

"Miner's Anemia."

By F. W. Gray.

(Continued from September 1.)

Great Britain.

Since 1893 repeated cases of anemia have occurred among the miners at the Dolcoath tin mine, Cornwall, increasing in number from one case in 1893 to twenty-nine cases in 1897. The Dolcoath mine is the most important in Cornwall. The workings are very extensive, the lowest level being at a depth of 470 fathoms. The illness among the miners was at first attributed to bad ventilation, as were the cases at Anzin in France before referred to, but after an investigation in 1902 Dr. Haldane came to the conclusion that the mine was infected with ankylostome ova. Acting on this conclusion, he treated his first patient with thymol and relieved him of 260 ankylostomes. Many of the sick men suffered from itching of various parts of the skin "with urticaria-like, or pustular eruptions, called by the miners 'bunches.'" The principal focus of the infection was the engine shaft. This shaft was used as an upcast, and in consequence was very moist and warm, the temperature being about 79 degrees Fahr. The manager, Mr. Thomas, was led to associate the prevalence of "bunches" with the pollution of the mine by excrement, and he took steps to remedy this by providing privies on the surface, and warning his men against pollution of the workings. He also improved the ventilation of the engine shaft and considerably lowered the temperature. Since that time the number of cases of anemia has greatly decreased, and at the time of Dr. Haldane's visit the epidemic was considerably abated.

The migratory habits of the Cornish miner are well known, and there is little doubt that the disease was introduced by men who had lived in tropical countries, and it is very probable the disease was introduced from South Africa or some part of South America. Steps have been taken to educate the English miner on the dangers arising from the promiscuous defecation under-

ground, and free lectures have been given throughout the mining districts, illustrated by lantern slides showing the worm at different stages of development.

In many collieries steps have been taken to provide underground closet accommodation, and to improve the surface arrangements in this respect. A joint meeting of representatives of the coal owners and the miners' unions was called by the Home Office authorities to consider whether any compulsory sanitary regulations were necessary, and it was concluded that a present no measures of this character were needed, but it is not unlikely that compulsory regulations with reference to the provision of underground closet accommodation may be enforced in mines having a temperature of more than 70 degrees Fahr.

Conclusions.

From the foregoing notes it will be seen that ankylostomiasis is a dirt disease, and has its genesis in uncleanly and unsanitary conditions. Br. Bruns, a German bacteriologist who took a prominent part in the Westphalian anti-worm campaign, is very insistent in his writings on this subject on what he calls the "disposition" of a mine to receive infection. By "disposition" he designates a combination of natural conditions favorable to the reception and dissemination of infection. Many mines possess this receptivity to such a marked extent as to be practically artificial culture grounds, in every way adapted to the propagation of the parasite. The points of infection are multiplied indefinitely, and the resultant disease among those who work amidst such conditions will attain a virulence and to proportions that are probably impossible under natural outdoor tropical conditions. In mines of this character the course to be pursued is very obvious.

So far as the writer is acquainted with Canadian coal mines, this disposition is not present in any marked degree. In the large mines of the Cape Breton coal field, for example, the two necessary concomitant conditions of heat and moisture do not exist together in the same mine. The mines are damp, as is to be expected from their comparative shallowness, but they are cool and very well ventilated. Where the coal is worked at a greater depth the workings are of course much warmer, but they are so dry as to be dusty. Another feature that may possibly be counted upon as a deterrent is the composition of the mine water. The acids contained in the majority of the Cape Breton mine waters will no doubt act adversely on the recently hatched and unencysted larvae. As the mines advance under the bed of the ocean, these conditions may of course alter. It may be noted, however, that in similar circumstances the saline character of the percolated water has been found to kill the young unencysted larvae. Again, the system of coal extraction practised in Cape Breton, the thickness of the seams, combined with their low angle of dip, are features less favorable to the spread of the infection than the corresponding conditions in European coal mines. In working bord and pillar there are probably more holes and corners where deposited excreta may rest in undisturbed innocuousness than is the case in the highly inclined seams of middle Europe, where the clothes and the hands of the workmen become contaminated in climbing ladders and in descending chutes. In longwall work the goaf is obviously a convenient and harmless place for purposes of defecation. On the whole, therefore, natural conditions as they at present exist in Cape Breton would appear to ensure a comparative immunity from the incursions of the parasite. But, on the other hand, medical authorities have not yet fully determined what constitutes "disposition," and within what limits of temperature it is possible to promise complete immunity. There may be detached places in an otherwise immune mine where the conditions would favor the reception of infection. Further, and most important, considered in the light of European experiences, there is a very large foreign element in the Nova Scotian coal mines, recruited in many instances from portions of the Old World where the disease is known to be widespread. Many of these men are undoubtedly "worm-carriers," a state not incompatible with apparent robustness, and only to be ascertained by microscopical examination of the dejecta. As one German medical man pertinently remarks: "A single worm-carrier working in a mine possessing the disposition to infection is sufficient to infect the whole of that mine." That it is the contaminated condition of the underground workings that give rise to ankylostomiasis as a miner's disease is evidenced by the fact that in only two recorded cases has ankylostome infection been discovered among the wives and families of the miners in the European coal fields. In the two cases mentioned the infection was caught through contact with contaminated matter. One case was that of a boy whose duty it was to clean his father's pit boots, and the other was also a boy, who had been in the habit of eating the remains of his father's pit lunch.

While, therefore, there does not seem to be the remotest possibility of any need for such drastic and expensive preventive and curative measures as necessity has demanded in the mining centres of Europe, yet a plea for at least descent sanitary conditions is quite justifiable. The individual colliery manager is the best judge of whether his mine possesses any "disposition" to infection, and he can act accordingly. Especially can he endeavor to prevent the promiscuous deposition of faecal matter in hot, moist situations in the mine, or in places where it is likely to be disturbed and carried along by the traffic of the mine. Adequate and proper latrine accommodation on the surface is also a matter that is worthy of attention, nor would anything be lost by the provision of some place in a large pit bottom where faecal matter could be properly isolated and disinfected. Sanitation is as necessary at a colliery as at any other works where large numbers of men are employed, and some little attention to this matter would improve the morale of any colliery. In this connection it is to be feared that the closet accommodation of many colliery villages is primitive and unsanitary.

One of the leading coal corporations of Canada, which recently imported a number of Belgian miners, took the precaution of engaging only such men as were able to produce their "worm-free" certificate, showing that they were, in the opinion of some qualified man, quite free from ankylostome infection. Recently one of these men, writing home to his friends, stated that the conditions of work were admirably suited to those who had suffered from ankylostomiasis.

In conclusion we would say that any statements of an alarmist character are most strongly to be deprecated, for, as before stated, most Canadian mines lack the "disposition" to infection that in most European mines existed in a marked way, but, despite this fortunate fact, the whole subject is worthy of attention from mining engineers and mine doctors in Canada and the States, both from a sanitary and from an economic point of view.

THE LABOR SUPPLY OF CAPE BRETON.

By Our Own Correspondent.

The inadequacy of the labor supply in the Cape Breton mines is a problem of increasing acuteness, and one might almost state that it is the only problem of any real gravity from a managerial point of view that we have down here. The natural conditions under which coal is mined in Cape Breton are remarkably favorable, but the labor question is a constant disturbing factor that must be taken into account in all calculations of output. It is not a simple question, but is complicated by a combination of local circumstances and traditions, with climatic and geographical conditions of an unusual character.

Since 1890 the production of the Cape Breton coal mines has quadrupled itself, and while such a rate of progression cannot be indefinitely prolonged, yet there will be no slackening in outputs for a long time to come. On the contrary, the yield of the Cape Breton mines must increase along with the general and inevitable expansion of the whole Dominion of Canada. The total output of coal in Canada is a little over 8,000,000 tons at the present time, but in the next ten years this tonnage will probably be produced in Cape Breton Island alone, if the men can be found to produce it. The population of Cape Breton has not increased in anything like the same ratio as the increase in its mineral exports. The native miner is as efficient a workman as can be found anywhere, but he is decreasing in numbers. Every year the children of the miner show an increasing disinclination for the calling of their father. To-day the sons of Cape Breton miners are to be found scattered over the New England States and throughout the rest of the Dominion, many of them holding lucrative and responsible positions.

In the past the sheet anchor of the mines when in want of labor has been the outports of Newfoundland, but the ancient colony has also shared in the advance and prosperity of the Dominion, and to-day Newfoundland has her own growing industries. Men are not to be picked up there to-day as they were in former years.

Then over all is the lure of the West, so tempting to the adventurous sons of a Highland race, when they hear the glowing and over-wrought tales of the Western land agent. If they heard their own Cape Breton farm described by one of these same gentlemen they might possibly wonder why they ever left it. Why should all the eloquence of the Dominion be used to set forth the advantages of the West, and to encourage the emigrant to go there? Are there no natural advantages, no beauty spots in the East to invite the settler? However, after all is said, it is the destiny of our race to "go West," and this is the day of the "last West." There seems no likelihood that this drain on the Cape Breton population will lessen for some time to come.

The fact that the major portion of the product of our mines goes up the St. Lawrence, and that the season of navigation is confined to the period between say the middle of May to the end of October, or to six months out of the twelve, necessitates a considerable difference in the rate of production during the season of open water and the winter months, and it is, therefore, unavoidable that a certain portion of the mining population should be of a more or less migratory character. This circumstance limits the number of resident miners and permanent settlers in the colliery towns. This difficulty has in recent years been very largely minimized, and it will never agin be so acute as it has been in years gone by, although it can never be entirely removed.

These are some of the circumstances that have operated to bring about the present stringency, but there are other conditions that make it difficult to relieve the situation, and some of these we may enumerate.

In many respects the price of living in the industrial centres of Cape Breton is unnecessarily and inexcusably high. This is particularly true as regards garden produce and meats. Why it should be necessary to bring market garden produce all the way from Truro and further, and dressed meats from Ontario, is not quite clear. There is a population of something like 30,000 people in the Sydney and Glace Bay district, nearly all of them earning big wages, and there is not a market garden worthy of the name in all the county. Neither is there any proper means of exchanging the dairy, garden and other produce of the farmers from the country with the industrial population. Under present conditions the farmer must barter his goods to the storekeeper, who retails them to his customers, the result being two profits to the merchant, inadequate remuneration to the farmer, and increased prices to the consumer. A weekly market would remedy this state of affairs, and would bring the agricultural interests of the county into closer touch with the workers, to their mutual advantage. However, as the Town Councils in most of the towns in question are composed of tradesmen, it is not to be expected any move of this kind will emanate from them or have their support. The same conditions adversely affect fishermen, and the price of fish, which in a place like Glace Bay should be cheap, but is not. It is no wonder that newcomers to the mining districts become scared when they are asked 25 cents for a cauliflower, 10 cents for a cabbage, and a cent each for very small carrots!

The people of this Island do not receive the stranger with open arms, and there still survives here some of the spirit that regards everybody coming from beyond Canso as a "foreigner," and this is apt to frighten away the emigrant, more especially if he excites hostility by explaining how they do things "at home." The people of this Island must be known before they are understood by the stranger, and if he remains here he will learn that they can appreciate a "proper man" and that nowhere else in the Dominion are there better chances for the man who is not lazy than in Cape Breton.

Another and more serious setback to immigration here is the lying reports that are purposely set afoot by disgruntled individuals as to conditions here, and industriously circulated in the newspapers of foreign countries and also in England. Public men in our Empire betray an ignorance about this country that is surprising, to say the least. In this connection we may refer to the recent warning that emanated from Mr. Keir Hardie, M.P., the Socialist leader of the Independent Labor Party in England, cautioning men against going to Nova Scotian mines. It is said that Mr. Hardie may speak at Glace Bay at the coming labor convention, and at the risk of being tedious, we think it may be interesting to quote his letter, published in the *Yorkshire Post* lately, and a rejoinder that appeared in the *Canadian Gazette*. Mr. Hardie appears to have confused Sydney, N.S.W., with Sydney, N.S. British members of Parliament have been

known to make similar geographical blunders before when dealing with the King's Dominions over the seas, and this letter of Mr. Hardie's is a fair instance of how flimsy is the basis on which some reports gain credence. We are very glad to notice that the Agent-General for Nova Scotia took such prompt action to counteract the effect of Mr. Hardie's warning, but we may point out that the *Yorkshire Post* is one of the most influential papers in the British Provinces and has the reputation of being particularly well-informed on Canadian matters. Mr. Hardie's warning had a very extended circulation.

MINERS AND EMIGRATION.

To the Editor of the *Yorkshire Post*:—

Sir,—In every mining district of England, Scotland and Wales just now bills are out inviting miners to go to certain unspecified mines in Nova Scotia and elsewhere, where high wages are to be had, and where the cost of living is no more than it is here at home. The trick has been so often played in the past that I would beg miners to be on their guard and to make inquiries before being tempted to go abroad without knowing what is in store for them.

As showing the need for caution, I ask you to be good enough to insert the enclosed letter which I have received, and which explains itself:—

New South Wales, Australia,
Woonona, April 23, '07.

Mr. Kier Hardie, M.P.,
Leader Parliamentary Labor Party,
England.

Dear Sir:—

I have been directed to write to you as being more closely in touch with the working classes of Great Britain, and especially that class which the paid envoys of the Australian capitalists are endeavoring to induce by false statements to emigrate to this country. There has recently arrived in this State of New South Wales a number of Scotch and Welsh coal miners who were misled by the glowing reports of the constant work and the high wages to be secured, but who now find that they can scarcely make a living wage, and are practically stranded in a strange land. I desire to state that there are more men here now than can get work at decent wages. The object of the employers in flooding the country with surplus labor is apparent to all of us, and I trust that now the question has been brought directly under the notice of your party that they will take such steps as will prevent in future numbers of their countrymen being misled and fleeced of what little capital they may be possessed of. I enclose a cutting of a paper published in the *Illawarra Mercury*, also the last issue of the *Sydney Worker*. In it you will see how some of the South Africans have fared after coming here. This must be the fate of those who arrive here for some time, until those at present here get work. As to the agricultural laborers required here, there are hundreds here prepared to work at it for almost their bare tucker until something else turns up, and you can judge of the great surplus of land when there has been as high as 800 applicants for three small blocks, and good men have been waiting for years to secure a block under the present system of balloting. I will be pleased to supply you with any information concerning labor conditions in existence here at any time, and trust that you will give every publicity to the statements contained herein.

Yours faithfully,
(Sgd.) THOMAS R. MORGAN,
General Secretary Industrial Employees' Union.

Trusting this warning may not be in vain,
Yours, etc.,
J. KEIR HARDIE.

The House of Commons, July 3.

Mr. Kier Hardie, by the way, signalizes his departure for Canada by issuing to the British press a warning against a notice circulated in the mining districts of England, Scotland and Wales inviting miners to go to certain unspecified mines in Nova Scotia, where wages are high and the cost of living no more than in this country. Mr. Keir Hardie sees some trickery in all this, and warns British miners to be on their guard. We have not seen the notices to which Mr. Keir Hardie refers, but the reference is, we imagine, to the intimation which the Dominion Coal Company, of Glace Bay, Nova Scotia, gave out in the spring that they would require a large number of men for work in their mines during the six months beginning with the end of March last. This intimation, we imagine, still stands good, and that Mr. Keir Hardie and his friends may see that there is no trickery about it, we reproduce the details of the offer as supplied by the company to Mr. John Howard, the Agent-General for Nova Scotia, at the end of March last. They say:—

During the coming six months we will require a large number of men for working our mines. This class of men we want will require to have had experience in coal mines. We require shooters and loaders—that is, men who can shoot and load coal after the mining machines. They will require to have shot-firers' certificates or be in a position to pass the necessary examination before the examining board at the colliery where they will be employed. We also require loaders and drivers. This is unskilled labor, and they do not require certificates, but it would be advisable to have men who have had experience in coal mines. At this season of the year there are large numbers of mine workers leaving England for Canada, and we believe that a considerable number of those men would prefer work in the mines rather than go farming, provided they were sure of getting steady employment on their arrival here. Our mine workers are all paid on a tonnage basis, and make good wages. Shooters and loaders make from $2 to $3 per day, and loaders and drivers from $1.50 to $2 per day. Board and lodging costs from $3 to $4 per week.

It is pleasing to note that the Premier of Nova Scotia has recently announced his intention of establishing a Department of Immigration for Nova Scotia. There is plenty of work for such a department, if only in the distribution of accurate facts about this neglected Province, and the prompt contradiction of such injurious statements as that of Mr. Hardie's. Recently the writer was on the "Empress" boat at Quebec that brought 2,000 odd passengers to this country. Out of the whole of that ship's company there were not a dozen people bound east of Montreal. All the rest were "going West." The ordinary emigrant to Canada, who has studied the literature that is distributed over on the other side, knows about as much of Nova Scotia as he does of Nova Zembla. The need of a Nova Scotian Department of Immigration is pressing.

Some of the assisted emigration to Nova Scotia has not been judiciously arranged, and in the last winter the

big industries at the Sydney terminus of the Intercolonial Railway were used as a dumping ground for indigent emigrants who were brought over in large numbers in the early spring to work on railway construction in the West. Owing largely to the severity of the season these works were not ready, and there were hundreds of men out of work in Halifax in February and March of all months. The Salvation Army were to blame for a great deal of hardship. To instance one case—a man, whose only qualification for employment at the mines was that he was a general laborer, arrived in Sydney on the 7th of March with his wife and six children, the oldest of whom, as we remember, was not more than eleven years old. The 7th of March will long be remembered as the date of one of the worst blizzards on record here. Imagine the case of this man, who had to find employment, housing and food for six children and his wife. He could hardly be blamed had he said hard things about Cape Breton. It is pleasing to know that he and his family were looked after, that employment was given him, and that he is now doing well. But this is not quite the way to arrange emigration, and somebody blundered and kept on blundering during the early part of 1907. On the same train was a young man with his wife and three children, and a mixed party of men seeking employment having such varied trades as clerk, green-grocer, gamekeeper, etc., not one of them having ever seen a coal mine. There was also the case of twenty men who were stranded at Port Hawkesbury for days, who were sent by the same organization. Their plight was related in every paper in Canada and in England, the blame being put on the coal companies. Before this mischievous paragraph had finished its newspaper career it was garbled and twisted beyond recognition, but the writer is in a position to say that it very materially and adversely affected emigration to Cape Breton. We fear that unless the Salvation Army mend their ways they will miss in Canada the most magnificent opportunity that ever offered itself to a religious organization. Every summer Cape Breton becomes the happy hunting ground of the Montreal labor agent, and employment sharks of every description with Semitic names. These gentlemen are kindly assisted now and then by our railways, who run cheap excursions to the West. One that recently left Sydney took away 300 men. The *Eastern Chronicle,* commenting on this, says: "The cars were loaded with young men, every one of whom is wanted at home; there is plenty of work for each to do at home, for which he would earn more money than he will in the West. This principle, by a system of extensive advertising and cheap railway transportation, of denuding the East of young men for the sake of the West, is a national scandal." The *Eastern Chronicle* might have added that no one ever heard of cheap rates to the coal fields and the steel industries of Cape Breton on these same railways. And yet we venture to think that the coal and steel of Cape Breton are national assets as valuable and as necessary to our national welfare and advancement as the wheat fields of the West. We do not wish to disparage the West. It is not in the power of any man to disparage so great a country as the West of Canada, but when our industries in the far East languish for want of laborers, are we not entitled to equal facilities and similar consideration?

What one might term the human element plays no small part in the matter of a labor supply. Men who come out to a new country may do well financially and have every advantage, but sooner or later there comes the inevitable homesickness, the "Heimweh," that is not to be denied. This feeling is intensified by the isolated and monotonous life the newcomer must live. Many of the men who arrive here, particularly men from the Old Country, have been members of some church or other, and have found a great deal of their social life in chapel teas, meetings, etc. This is particularly true of the Nonconformist, and the dissenter predominates among the miners in the United Kingdom. We suggest that if the clergy were at more pains to follow up the newcomers their church membership would benefit, and more men would become permanent settlers.

We have before referred in these columns to the insane liquor laws of this Province, and to the lack of technical education or intelligent amusement for the workingman, and need not dwell on these matters now. All the same, they are matters of the greatest importance in having and holding industrial population.

While the miner and the miner's son find underground employment natural and not irksome, the man who has never descended a coal mine is apt to balk when asked to do so, even with the temptation of big wages. In actual fact, work in a modern well-ventilated mine is less trying than work on the surface, where men are exposed to the vagaries of the weather. However, the ordinary man, not being a miner, prefers to work above ground. Some nationalities take more kindly to pitwork than others. Italians, particularly the northern Italians, make good miners after a while, but permanent workmen are best obtained in other mining centres. Generally speaking, the problem is very different to the ordinary labor question, and the class of men required are limited in numbers.

The following is a presentation of the major factors in the labor problem, some of which it is difficult to express. The remedy for some of the difficulties enumerated is fairly obvious, and we take it that a general solution would involve many small adjustments of existing conditions, which, though insignificant in themselves, would total up to a good deal. In other words, the situation must evolve its own remedy, but it can be assisted in many ways. There are many matters with which we have not dealt, such as the attitude of the P.W.A., the nationalities best suited to Cape Breton industries, wages and housing, systems of coal working, etc., which must be left to a later issue.

The fire-damp detector of M. Hardy, a Frenchman, is an ingenious application of the microphone. Two pipes of equal pitch—one in the mine and the other above ground — are sounded simultaneously, and the sound waves impinge on microphones connected in series with a telephone. If both pipes are in pure air a clear note is heard in the telephone. If the pipes are in air of different density, beats are heard, and these give warning of the presence of fire-damp in the mine.

The following are the British newspapers whose representatives are invited to inspect the mineral resources of the Province of Ontario: Times, Telegraph, Morning Post, Standard, Tribune, Daily Mail, Financial News, Financial Times, Yorkshire Post, Birmingham Post, Liverpool Post, Manchester Guardian, Economist, Statist, Globe, Pall Mall, Financier.

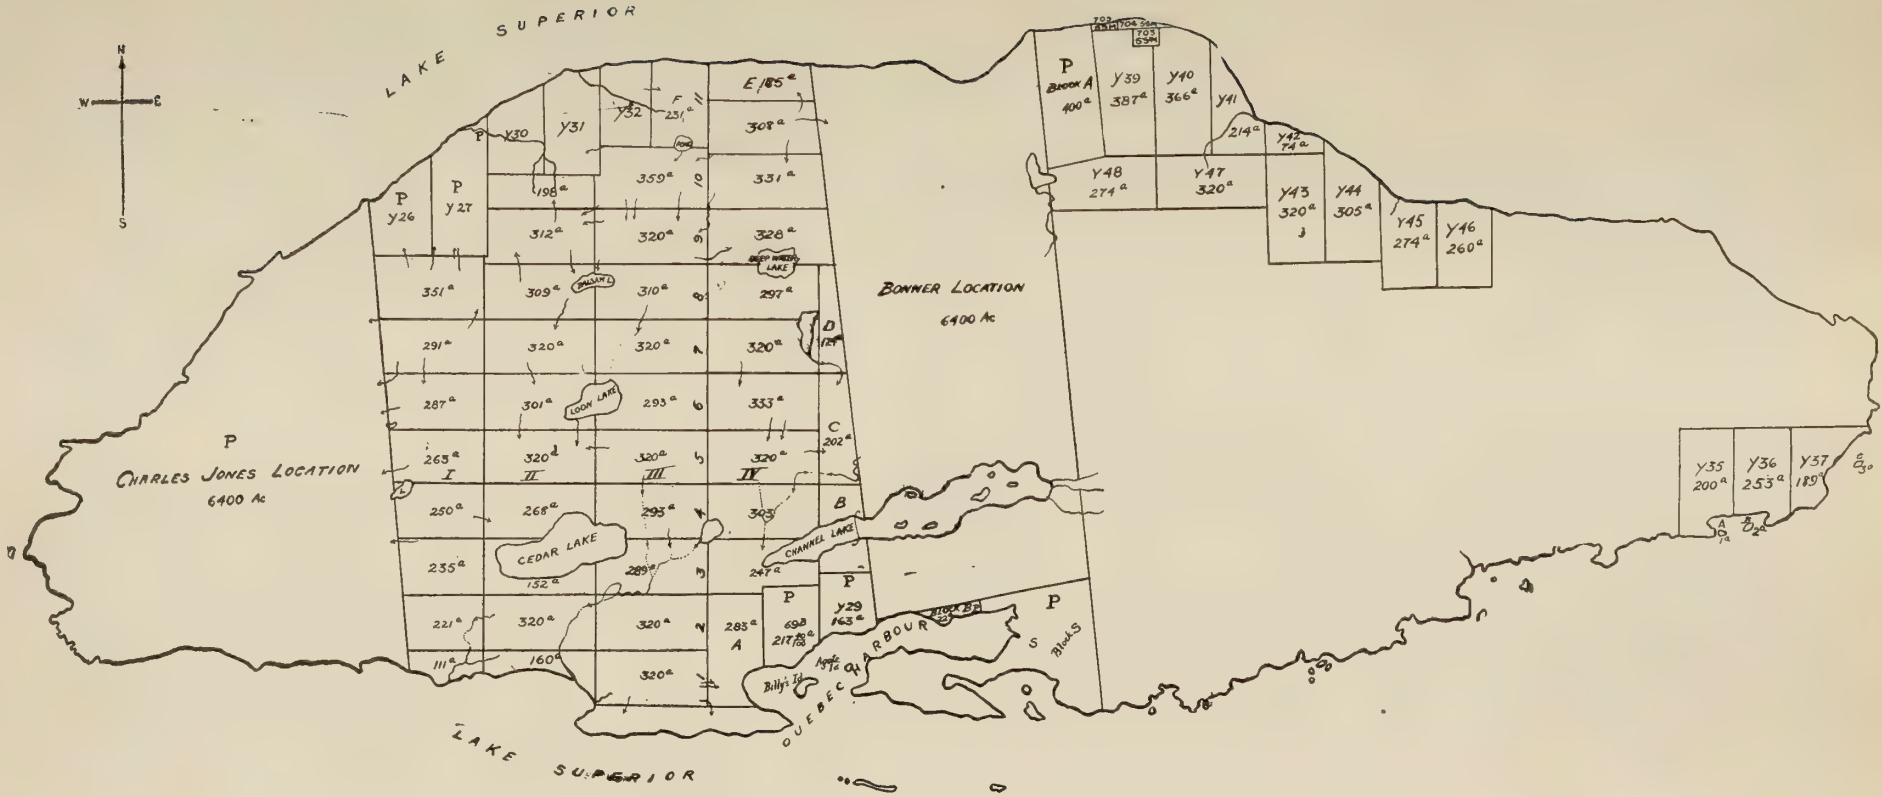
MICHIPICOTEN ISLAND.

A. B. Willmott.

It may be of interest to your many readers to have a little information concerning Michipicoten Island and the recent silver find reported there. Mr. Gordon Michael and partner have been prospecting on the island since early in the season, and recently came to Sault Ste. Marie to record their claims. He exhibited a specimen of native silver over a quarter of an inch in thickness which he had taken from a vein on one of his properties. Other specimens showed considerable native silver in a calcite gangue, and still others native copper. The silver vein is not wide, varying from one to three inches, and runs about at right angles to the direction of the copper bed. The matrix of the copper is not a vein, but a bed, following the strike of the formation, and from one to three feet in width. An analysis of an average sample of this bed is said to have yielded 2.6 per cent. in native copper. The news of the discovery spread through the Soo, and numerous prospectors have started for the island. It is reached by means of the steamers of the Dominion Transportation Company, sailing from here twice weekly. The island embraces in the vicinity of 45,000 to 50,000 acres, of which a considerable part is not even surveyed. The Jones location of 6,400 acres on the west end, and the Bonner location of the same size across the centre are the two main holdings on the island. Eight more properties of small acreage have been patented, and three mining claims recorded, so that not more than 15,000 acres of the island have yet been alienated from the Crown. Quite an additional acreage was at one time applied for, but applications have lapsed.

Geology.

Geologically the island is very similar to the formation on the south shore of Lake Superior as exposed at Keweena Point. As shown on Irving's map, in his work on the "Copper-bearing Rocks of Lake Superior," it is the lower part of the Keweenaw formation which occurs at both places. He writes, page 347: "The facts given above . . . establish then a complete identity between the Michipicoten Island rocks and those of the typical cupriferous districts of the south shore of Lake Superior."



The Canadian Survey has made almost no survey since 1865, when it was reported on by McFarlane in the report of 1863-66. The following paragraphs are published in the 1863 report:—

"Towards the west end of the island, the rocks present a low surface for a breadth of four or five hundred feet, and then rise into a cliff two or three hundred feet in height, in which the greenstone is marked by druses containing analcite and quartz. A soft amygdaloidal bed holding native copper is traceable for some miles along the shore, sometimes beneath the surface of the water in the bays, and again running a little distance inland. In this bed in the north bay an attempt was made, a few years since, to work a remarkable deposit of native copper and silver, which were found disseminated in grains through a green hydrous silicate of nickel. The ore being stamped, the nickel, whose value was not suspected, was washed away from the residue of native metals, which gave in one trial twelve parts of silver and eighty-eight of copper. A shaft was sunk here to a depth of 70 feet; but after a considerable outlay, the working was abandoned. Nothing very definite is known as to the mode of occurrence of this curious metallic deposit, which is stated, however, to have been associated with calcspar. From the same mine were said to be obtained the specimens of mingled arsenides of nickel and copper, which, with the preceding nickeliferous ore, are noticed on page 506, and again on page 737. At a point near the west end of the island, and seven miles from the workings just mentioned, the cupriferous stratum again appears, and fragments of the native metal are scattered along the shore. Mining operations on a small scale were undertaken here ten years since by the Quebec Mining Company, and a shaft was sunk at a little distance from the shore, by which the copper-bearing beds were reached at a depth of forty-five feet. The mine is now leased to Mr. Hugh R. Fletcher, who is engoged in working it, and has kindly furnished the following particulars. Beneath the principal copper-bearing bed is a soft argillaceous rock, known as an ash bed, which is six feet, and perhaps much more, in thickness, and is underlaid by a massive greenstone. The ash bed itself contains from one-half to one per cent. of disseminated metallic copper, which it is supposed can be economically extracted by crushing and washing the soft rock. Upon this reposes the principal copper deposit. The metal is found in a bed of greyish amygdaloid of from eight to eighteen inches in thickness, and an overlying bed of sandstone of from twelve to twenty-four inches; the united thickness of the two being on an average about three feet. The proportion of copper is the same in the two rocks, and averages two and a half per cent. The copper is in larger grains in the amygdaloid, and is sometimes surrounded by calcspar; while in the quartzose sandstone it is in fine particles, or in filaments. Small specimens of the sandstone are occasionally found containing ten or fifteen per cent. of copper. The bed is overlaid by a massive compact greenstone, to which succeed amygdaloid and conglomerate. The dip of the copper-bearing stratum is about three feet in a fathom. Three shafts have been sunk upon it, one to sixteen fathoms, one to twelve and a half, and a third to eight and a half fathoms. From 300 to 400 tons of two and a half per cent. ore have been raised; and in the spring of 1863 it is proposed to commence operations on a larger scale, with proper machinery. Small portions of native silver and of vitreous copper ore have been found in this vicinity; and according to Mr. Wilson native copper occurs in a second band of amygdaloid about a mile and a half south of Mr. Fletcher's mine, and 200 feet above the surface of the lake. Vitreous copper ore is also found with calcspar and sulphate of barytes on the eastern extremity of the island, in a reddish phorphyritic rock, near which occurs a pitchstone phorphyry, and pitchstone with veins of agate."

History of the Work.

The first work of any consequence was done about the years 1860-61 by Mr. H. Fletcher on behalf of New York parties with very encouraging results. Financial difficulties caused the property to be abandoned. In 1875 the Quebec & Lake Superior Mining Association made extensive explorations, and erected buildings on the Jones location. About the same time Phillips explored on the adjoining locations to the east and sunk several shafts and found good copper in all. In 1880 the Michipicoten Native Copper Company was formed, and began work on a very extravagant scale, which soon brought them into difficulties.

Later the property passed into the hands of Mr. Joseph Cozens, of Sault Ste. Marie, who interested parties con-

MICHIPICOTEN ISLAND

nected with the Standard Oil, and this location (the Jones) has passed into their control. The bulk of the work done has been on an amygdaloid bed similar in character to the lode of the Quincy Mine of the south shore of Lake Superior. The main shaft is 520 feet deep, and the Batler shaft 360. A little over a mile west of the main workings, a conglomerate bed was discovered, on which a shaft was sunk showing the pay streak two feet wide and carrying 5 per cent. copper.

The Bonner location, after lying idle for a long time, passed this summer into the control of some Sault Ste. Marie parties who interested some Chicago parties in it, and a diamond drill has been at work for some months with encouraging results.

Ore Possibilities.

All parties who have examined the island do not hesitate to compare it with the similar formation on the south shore of Lake Superior, and in consequence to expect that copper of value will be found. Indeed, the surface indications have been most promising, and had more skill and more economy been used in the development operations there is no doubt but that a successful copper mining company would long ago have been established. As to the silver possibilities, the question is a very uncertain one, as we are forced to reason almost entirely from analogy. Specimens of native silver are of frequent occurrence on some of the south shore properties, associated with the native copper, but no large amounts have yet been taken out. Similar association of the silver with the copper is found on Michipicoten Island, and whether it will be found in larger amounts than on the south shore one cannot say. Certainly rich specimens of it do occur, so rich that had they come from the vicinity of Cobalt there would be a stampede at once. It is to be noted that the diabase with which everyone admits the silver of Cobalt is connected, is probably of the same age as the enormous diabase intrusions found on Michipicoten Island. Further, it is to be noted that the arsenides of nickel are common to the two districts, though so far as discovered not yet in large amount at Michipicoten. One must, however, be guarded in inferring that because diabase eruptive of the same age occur at both places, and that the nickel minerals associated with silver are found in both places, that both places will be equally rich. The similarity is, however, excellent ground for the careful prospecting of Michipicoten Island for silver, although perhaps the probabilities are that native copper will in the long run prove the more remunerative. In searching for native copper, it is well to remember that there are two classes of ores, the one found in the conglomerate and amygdaloid beds, and the other found in the veins crossing these beds. No copper is found in the acid eruptives, nor in the massive portions of the diabase; it is the upper vesicular portions of the lava flows in which the copper is found. Epidote, chlorite and prehnite are the most frequent mineral associates of the copper. Calcite veins are usually poor in copper. Where veins are found they usually widen in passing through the soft rocks like amygdaloid and narrow off in the massive diabase; the contacts with the softer rocks are more likely to prove metal-bearing. In the conglomerates it has been found that the thinner beds near the diabase sheets are the more likely to be productive.

DR. ROBERT BELL, F.S.R.

Chief Geologist, Geological Survey of Canada.

Dr. Robert Bell, the present Chief Geologist of the Geological Survey of Canada, is a son of the late Reverend Andrew Bell, an amateur geologist of note in the early days of the Survey, and a personal friend of Mr. (afterwards Sir William) Logan. After the death of the senior Bell, his son was sent out by Logan on field geological parties under Mr. James Richardson. In 1859, when he was not more than 17 years of age, young Bell was given independent work on Manitoulin Island, on the southern shore of Georgian Bay and thence in the country southward to Lake Ontario. In 1860 he accompanied Mr. Alexander Murray, Assistant Provincial Geologist, to Lake Superior; but the following year he was given charge of a party of his own. In the autumn of 1863 he was appointed Professor of Chemistry and the Natural Sciences in Queen's University. This position he filled for five sessions and at the same time continued his field work each summer. In 1869 he resigned and the same year was employed as chief of a large party in the Thunder Bay District and in making a topographical and geological survey of Lake Nepigon. Later he was on the Government expeditions to Hudson Straits and Bay, on the Steamships Neptune, Alert and Diaga, as geologist and naturalist. On the first two expeditions he also acted very acceptably as medical officer.

Dr. Bell has now been connected with the Geological Survey for fifty years. His robust health has enabled him to accomplish a large amount of work. The scene of his labors includes practically the whole of Canada.

Dr. Bell has always been particularly interested in obtaining the collections of economic minerals and useful mineral products for the various international exhibitions. From the year 1863 until the Survey officially took up the work, he voluntarily procured and prepared statistical and other mining information. It was on his invitation that the removal of the headquarters of the Survey from Montreal to Ottawa in 1881 took place.

For five years Dr. Bell was Acting Director of the Survey, and during that period the volume of work accomplished was largely increased. Indeed, one has but to glance through any of the publications of the Survey for the past half century to get some conception of the variety and excellence of Dr. Bell's labors.

In 1903 Dr. Bell was commissioned as a delegate from the Dominion Government to proceed to Vienna in order to invite the International Geological Congress to meet in this country. Before this, in 1888, he was selected by Sir Oliver Mowatt as one of the Royal Commissioners on the Mineral Resources of Ontario, and he wrote important sections of the report of that Commission.

Dr. Bell's scientific accomplishments are not, however, confined to geology and mineralogy. He has published several brochures on Canadian forestry. He has also studied the archæology and ethnology of the native races of Canada. This pre-eminence in these emdite branches of knowledge is evident from the position he holds as President of the International Congress of Americanists, which held a highly successful meeting at Quebec last September and will hold its next meeting in Vienna in 1908.

DR. ROBERT BELL

As an explorer and geographer Dr. Bell has done most notable service to his country. The traveller in sub-Arctic regions encounters many evidences of this in the nomenclature of striking topographical features.

Last year the Council of the Royal Geographical Society recognized the value and extent of his explorations by awarding him the Patrons' Gold Medal. In January of the present year the Council of the American Geographical Society voted him the Cullum Gold Medal, and about the same time the Duke of Argyll sent him a very valuable gold medal "in admiration of his services to geology in Canada."

Dr. Bell is the possessor of a phenomenally large number of degrees. Not only is he a graduate B.Sc., a D.Sc. and a M.D.C.M., but he also can boast a long list of honorary degrees. In 1897 he was elected a Fellow of the Royal Society of London, a high distinction; but a few years ago there was conferred upon him the Companionship of the Imperial Service Order "for faithful service."

In closing this necessarily incomplete and scanty account of Dr. Bell's long career, it may be added that from him a large number of young geologists have received their first lessons in field geology.

COAL MINING IN ALBERTA IN 1906.

From the annual report of the Department of Public Works of the Province of Alberta some significant facts and figures are to be gleaned concerning the progress and present condition of coal mining in that new Province.

In the year 1901 the total output of coal for the Northwest Territories, Alberta and Saskatchewan was computed to be 346,649 tons. During the years 1902, 1903 and 1904 the output stood at 510,674 tons, 622,939 tons, and 782,931 tons, respectively. But the year 1905 saw Alberta alone raise 811,228 tons, and in 1906 the figure of 1,385,000 tons had been attained, or almost exactly four times the output of 1901, and an increase of 70.73 per cent. over the 1905 output.

The report classifies the coal raised thus:

Lignite coal	602,780 tons.
Bituminous coal	546,623 tons.
Anthracite coal	235,597 tons.
Coal used in coke production	103,936 tons.
Coke produced	69,844 tons.

On account of the large amount of lignite mined in the Province, the recent step taken by the Railway Commission in prohibiting the use of this fuel on railways, on account of its high percentage of volatile combustibles, and its liability to cause locomotives to emit sparks, will have a very serious effect upon the Province.

If the figures representing the coal used in coke production and the coke produced are correct, they imply that a yield of over 67 per cent. coke has been obtained in bee-hive ovens from Alberta bituminous coals. This speaks well for the coals and for the management of the ovens.

Accidents.

In proportion to the coal raised, the percentage of accidents was slightly higher than in the United States. For each 138,500 tons, one person was killed, 1.1 persons seriously injured, and 2 persons slightly injured. Nova Scotia, in this respect, holds the world's record—250,000 tons of coal for each fatal accident; Great Britain comes next with 210,800 tons, then France with 200,000 tons, the United States with 165,000 tons, and Germany 154,773 tons.

In the past year, then, in the coal mines of Alberta there were 10 fatal accidents, 11 persons were seriously injured, and 20 slightly injured, making a total of 41 accidents. Of the fatalities, five resulted from falls of coal, rock or clay.

In commenting upon those casualties, it must be remembered that most of Alberta's coal mines are in the first stages of development. The average number of employees for each mine is much smaller than in older countries, and operations are spread over a very large area. Hence rigid inspection is difficult, and many precautions valuable in more developed mines are either inoperative or positively harmful at present. Under these conditions, the list of accidents is not excessive. It by no means follows that improvement is not possible. The Albertan Government has proved itself alive to the requirements of its thriving coal industry, and, we doubt not, each year will reduce the percentage of fatalities and accidents.

Coal Mines Opened and in Operation.

There are 61 coal mines in operation in the Province in 1906. Sixteen of these were opened during the year. Two mines also were abandoned during 1906, one at Edmonton and one at Frank. Among the principal producers are the following:

The Pacific Coal Co., Bankead, has an output of 1,200 tons per day. An electric plant operated at the mine supplies the towns of Bankhead and Banff with light. The main tunnel has a length of over 3,000 feet from the mine mouth. The system of working is breast and pillar. A one-unit briquetting plant, built under the patent of the Zwoyer Fuel Company, N.Y., was installed during the year. It has a capacity of 200 tons per day. One marked feature of this camp is the fact that the company runs a large and well equipped skating and curling rink for its employees.

At the International Coal and Coke Company's mines at Coleman, ninety new return ovens were installed, together with a Bradford coal braker and slate picker to crush and clean the coal from No. 4 seam.

The Canadian-American Coal and Coke Company have installed a modern tipple plant, capacity 1,000 tons per day, placed about a quarter of a mile from the mine mouth. The coal is hauled that distance by means of a main and tail rope haulage.

The Hillcrest Coal and Coke Company, Hillcrest, operate three seams, having thicknesses of 14 feet, 12 feet and 8 feet, respectively. The system of working is pillar and room.

Two mines are operated by the West Canadian Collieries, of Blairmore—the Bellevue and the Lille. At the latter mine the slack is washed and coked in a battery of Bernard ovens.

The following companies are actively developing their properties and are producers already or are about to produce: The H. W. McNeill Co., Canmore; the Breckenside and Lund Coal Co., Lundbreck; the Alberta Railway and Irrigation Co., Lethbridge; the Diamond Coal Co., Lethbridge; the Reliance Coal Mining Co., Taber; and the Canada West Coal and Coke Co., Taber. One of the companies mentioned above, the Alberta Railway and Irrigation Company, of Lethbridge, have installed a Rand B. 2 duplex non-condensing compound air compressor plant, capacity 2,848 cubic feet of air per minute at sea level. This is the largest compressor of its class made by the Canadian Rand Drill Company. Here also is installed a 200 k.w. generator manufactured by the Allis-Chalmers-Bullock Company, and driven by a 20x 20 direct coupled engine of the Robb Engineering Company's manufacture.

Considerable trouble is reported in the introduction of safety lamps in the Crow's Nest Pass mines. Satisfactory arrangements have now, however, been made. The scarcity of fire-boxes is remarked. The ordinary miner can make more money than the fire boss who is paid $3.50 per day. The average coal miner's wage, mining coal on contract, varies from $75 to $180 per month.

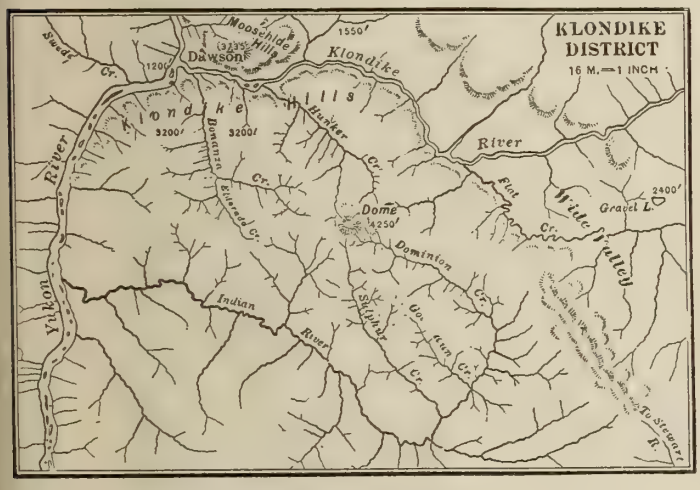
The general wages for day labor is as follows:

Inside Men.

		No. hours.
Fire bosses	$3.50	8
Shot lighters	3.00	8
Bratticemen	3.00	8
Bratticemen helpers	2.50	8
Timbermen	3.00	8
Timbermen helpers	2.50	8
Drivers	2.50	8
Drivers, wet places	2.75	8
Team drivers	3.00	8
Machine men	3.50	8
Machine men helpers	3.00	8
Tracklayers	3.00	8
Tracklayers' helpers	2.50	8
Rock miners	3.50	8
Miners	3.00	8
Miners, wet places	3.50	8
Laborers	2.50	8
Switch boys	1.50	8
Door boys	1.00	8
Hoistmen	2.75	8

Outside Men.

Pithead men	2.50	10
Slate pickers, men	2.00	10
Slate pickers, boys	1.25	10
Blacksmiths	3.50	10
Blacksmiths' helpers	2.50	10
Mine carpenter	3.50	10
Outside laborers	2.00	10
Machinists	3.20	10
Lampmen	2.50	12



CONCENTRATION OF GOLD IN THE KLONDIKE.

J. B. Tyrrell.

The study of the origin of ore deposits is one of the most fascinating subjects of investigation which the mining engineer or geologist can undertake. The results of his investigations are, in most cases, sufficiently indefinite to escape final conclusions, but at the same time they constantly bring together new groups of facts and ideas which tend towards definiteness and raise hopes of conclusive results.

The uncertainty which hangs over our knowledge of the origin and mode of deposition of ores is especially marked in connection with the consideration of veins or lodes, but the mode of formation of many placer deposits is also not clearly understood, and the source and method of concentration of the gold or other valuable mineral has not been definitely determined.

In the midst of this uncertainty it is interesting to consider briefly the conditions that prevail in the Klondike district, Yukon Territory, Canada, a country of exceedingly rich gold-bearing placers, where the origin and processes of deposition and concentration of the gold into its present position are quite easily recognized and interpreted.

Map of Klondike District.
(Courtesy of Economic Geology)

The Klondike gold-bearing district lies in the basin of the Yukon River, just south of north latitude 64 degrees, and about fifty miles east of the 141st meridian which forms the boundary line between Canada and Alaska. It is more or less rectangular in shape, with a greatest diameter in a general east and west direction. Its total area as considered in this paper is about eight hundred square miles.

It is a well-defined physiographic unit, consisting of a mountain mass separated from all the surrounding mountains of the Territory, except at its extreme south-eastern angle, by deep and wide valleys, from which the land rises in easy slopes to a highest point near the centre of the area. The greatest relief is 3,050 feet, this being the difference in height between the bank of the Yukon River at Dawson, with an approximate elevation of 1,200 feet above the sea, and the summit of "The Dome" with an approximate elevation of 4,250 feet above the sea.

The district is bounded on the west by the valley of the Yukon River, which is one of the largest streams on this continent; on the north by the equally wide valley of the Klondike River; on the east by a great valley much wider than those just mentioned, that extends along the southwestern base of the Ogilvie Range of the Rocky Mountains and constitutes one of the principal topographic features of the Yukon Territory. On the south the valley of Indian River, a tributary of the Yukon, forms the boundary for the greater part of the distance, the exception being a narrow ridge at the south-east corner of the area, connecting these mountains with those to the south.

These mountains are not rugged pinnacles and ridges like the Rocky or Coast mountains to the north and south, but their summits are well rounded and their sides descend in gentle slopes into the valleys that radiate in all directions from the highest points. The bottoms of the valleys, too, both small and large, have very regular grades, and the streams that flow in them are not interrupted by either lakes or waterfalls. Some of the north-flowing streams have rather steeper and more gorge-like channels cut to depths of two or three hundred feet into and below the bottoms of the old flatter valleys, but even in these the grades are regular and continuous.

Bank of White Gravel.
(Courtesy of Economic Geology)

The country is largely underlain by schistose rocks which take their distinguishing characters from the presence of sericite, chlorite, graphite or quartz. They are all very old, geologically speaking, dating probably from Precambrian or Cambrian times, and have been very much folded, crumpled and twisted, and consequently they have been greatly altered from the eruptives or sediments as at first formed or deposited.

These schists are cut by many narrow veins, stringers and lenses of gold-bearing quartz, and while these veins, etc., are more numerous and probably more highly mineralized in some places than in others, they would seem to be present everywhere in these schists although in no place have they been found sufficiently closely aggregated, large or rich to pay for mining in themselves. However, they are very interesting and important, as the gold collected in the placers in the bottoms of the valleys was derived from them.

In a few places around the margin of the Klondike district outliers of sedimentary rocks of Eocene age occur. During this period the land would seem to have been lowered so that the present four thousand feet contour line

was at or near the level of the sea, for at this elevation the remains of a vast peneplain can be traced on the hills, not only of the Klondike district itself, but over great expanses of the Yukon Plateau which stretches away to the south and west, the rounded tops of the mountains, as seen from any of the higher summits, extending away to the horizon like billows on the ocean. The summit of the Klondike mountain mass evidently formed part of this old peneplain, though some of the largest depressions around and near it were undoubtedly marked out at that time. Assuming that this portion of the peneplain sloped down into the surrounding valleys, which were then submerged, the general elevation of the Klondike mountain mass, taking present sea level at a datum, was about 3,500 feet.

After the land was raised well above the level of the sea atmospheric agencies began the decomposition of the rocks, and the breaking apart and liberation of the rock particles one from another, while the rain and the smaller and larger streams cut out the valleys, dissolved parts of the rock, and washed the undissolved particles from the higher to lower levels. The very heavy particles, such as the grains and nuggets of gold, would settle close to the places from which they were derived, while the lighter particles would be carried farther away.

The process of decomposition and erosion, with transportation and separation of the eroded material, went on continuously from year to year and from age to age until the land had been reduced almost to its present level, and the bottoms of the wide and relatively shallow

View from Bonanza towards Gold Hill and the Town of Grand Forks.

At or shortly after the close of the Eocene period the land was raised above the sea, and it has not since been submerged, so that ever since then it has been continuously subject to decomposition by meteoric agencies, and to subaerial and stream erosion, the streams having assumed and retained normal courses outwards from the centre of the mountain mass.

The district lies in the unglaciated area between the glaciated Ogilvie Range of mountains to the north-east, and the much more severely glaciated Chilcat or Coast Range of mountains to the south-west, and while there is a possibility that during the glacial period it may have had some local glaciers of its own in the higher portions of its valleys, none of the glaciers from the north or south reached it, and there was no transportation of material to it from any outside source. Its problems of erosion, transportation and concentration are therefore entirely confined to itself.

valleys had been filled with coarse pebbles and cobbles of the harder and more resistant kinds of rock, though chiefly vein quartz, that had been slowly washed down from the adjoining hills. Mixed with these larger masses of rock were the smaller but heavier nuggets and grains of gold, which had been washed out of the same hills, but on account of their weight had not been carried away with the rock particles of the same size. The beds of quartzose gravel thus formed are locally known as the "white gravel" or "white quartz wash."

After these gravel beds were formed the northward-flowing streams were accelerated and given greater cutting power in some way, probably by a tilting of the land from the south northward, consequent on the continued rising of the mountains near the Pacific Coast. These streams therefore cut narrower valleys, with steeper sides, through the "white gravel" and into the underlying rock, leaving terraces of the "white gravel" on one

Ladder and Bucket Gold Dredge on Flat of Klondike River near mouth of Bear Creek.

or both sides of the valleys, and reconcentrated into their beds the gold from the gravel which they had cut through and washed away, as well as any gold that may have been in the rock cut through below the older gravel.

These two sets of gravel deposits have together produced to date about six million fine ounces of gold, and it is not improbable that there are still four million ounces remaining in the placers, making a probable total gold content for these Klondike placers of ten million fine ounces of gold.

As has been shown above, this gold was concentrated by the rills and streams from the whole of the rocky material washed down from the Klondike mountain mass, and it probably represents a considerable proportion of the gold originally contained or included in the rock.

In reference to the quantity of rock that was so washed down by eroding and transporting agents acting continuously through a long period of time, only approximate data are obtainable, but the following statement is believed to represent with a reasonable degree of accuracy the conditions as they existed during the erosion period.

As stated above the mean elevation of the land when active denudation began at the close of the Eocene period was 3,500 feet, taking the present sea level as a datum. The mean elevation of the district at present is about 2,600 feet above the same datum, from which it would appear that the thickness of rock removed from the surface between the end of the Eocene age and the present time is equal to a thickness of 900 feet over the whole area. Adopting the ordinary time scale of 4,000 years for the removal of one foot of surface, 3,600,000 years would be the time required for the removal of this 900 feet of surface, and such, according to this computation, would be the length of time since the close of the Eocene period. A thickness of 900 feet over an area of 800 square miles would equal a mass of 136 cubic miles or 1,600,000,000,000 tons of rock. This is therefore the quantity of rock that was removed by denudation, and from which 10,000,000 ounces of gold was washed and concentrated into the Klondike placers, and it represents an average gold content of 0.003 grains or 0.013 cents to the ton of the original rock in place.

It is thus seen that the Klondike district owes its phenomenally rich placers not to the wearing down of highly mineralized gold-bearing veins or lodes, but rather to the favorable conditions of long continued and uninterrupted concentration from a great mass of rock that contained only very minute quantities of gold.

THE DISCOVERY OF THE KLONDIKE.

By Major Henry J. Woodside.

Robert Henderson, discoverer of the Klondike, was born in Pictou, Nova Scotia, about fifty years ago. At the age of fourteen he ran away to sea, sailed around the world, and mined in Australia, California and Colorado.

In July, 1894, he arrived at Ogilvie Post, at the mouth of Sixty-mile River, Yukon. He outfitted with Joe Ladue, and contrary to advice, started with one companion, Collins, up the Indian River. They prospected on Quartz and other creeks, and late in the autumn had a dangerous and starving trip back to Ogilvie.

During the winter Henderson started alone with a sled load of supplies for Quartz Creek. He mined there until March, but found nothing. In the early spring,

through ice and slush, he moved his scanty outfit to the upper waters of Indian River, and began to prospect that district.

Here he was the victim of a ghastly accident to his leg which nearly ended his career then, and again on two perilous winter trips at a later date.

When the wound had partially healed, he spent the rest of the summer in his planned work. Toward fall he ran down to Ogilvie for supplies, and returned with Redford. They began extensive miner work on Quartz Creek, preparatory for general sluicing next summer.

After another visit to Ogilvie, Henderson spent the winter alone on Quartz Creek, working every day in "burning" holes through the frozen gravel to bedrock and drifting tunnels in search of the pay streak.

In the spring he washed up about $600 in gold. Then he crossed the ridge separating the Indian River and Klondike River basins, and found good prospects on Gold Bottom Creek (a branch of Hunker). He at once returned to Quartz Creek and induced some visiting prospectors to accompany him back. Four of them remained, and they began regular minerlike work, ground sluicing, etc. He crossed over the ridge between Gold Bottom and Hunker branches, and staked on what is now called Hunker branch.

When food began to fail, Henderson went via Quartz Creek back to Ogilvie. With a loaded boat he could not ascend Indian River, and was compelled to return via the Klondike.

Where Dawson now stands he found George W. Carmac, with his Indian wife and her relatives. He invited Carmac to come up and stake on his new find, then poled his loaded boat up the Klondike to the mouth of his own stream, and marked it on a blazed tree as "Gold Bottom" Creek. When he arrived in camp he found Carmac, "Skookum Jim" and "Tagish Charlie" there. After they had staked and Carmac was leaving, Henderson strongly urged him to test the gravel on Rabbit Creek (now Bonanza), and if he found anything, to send one of the Indians back and he would be paid. Carmac promised.

They camped on what is now called Discovery Claim, Bonanza Creek, just below the forks of Bonanza and Eldorado branches. While Carmac slept Skookum Jim panned gravel and found coarse gold. Next day they panned out $13, staked claims, and, forgetting Henderson, left for Dawson and thence to Forty-mile. Carmac's story was not believed at first, as he was neither prospector nor miner. Later a stampede set in, Bonanza and Eldorado Creeks were staked to their source, but for some weeks no one knew that the claims were of any value, and rich ones were sold for a trifle.

Be it observed that Carmac did not record his claim on his first visit to Forty-mile, but a month later, when as a result of some work, the richness of the ground was being shown. The regulations in those days allowed sixty days between staking and recording claims. By this means a new find could be tested before it was necessary to make a tedious journey to the recording office.

When Bonanza and Eldorado were being staked, two of the lucky ones, Andrew Hunker and Johnson, started over to see what Henderson had found. They went too far along the divide, and dropped down the wrong, or eastern branch of Gold Bottom, and testing the creek as they went, finally staked three claims below Henderson's stakes. They washed out $23 of coarse gold, and then hunted up Henderson's camp to show their prospect. The discoverer made the remark that they had found better prospects than he had. Recognizing that the name of the main creek was Gold Bottom, they tossed up in the presence of Henderson as to which should have the naming of the east branch. Hunker won.

When Hunker applied at Forty-mile to record his claim, the recorder did not acknowledge Henderson's prior staking, and also changed the name of the main creek to "Hunker." He gave Andy the discovery or double claim, entirely ignoring the real discoverer.

Henderson and his four companions divided up about $700 of gold among them, and when, still well within the sixty days regulations, he applied at Forty-mile for the record of a discovery claim made on Gold Bottom, one on Hunker, and an ordinary claim on Bear Creek, he was told that he could record only one claim in the "locality" (that is, one out of five staked). Having no recourse in those days from the recorder's decision, Henderson chose the half of his discovery claim on Hunker branch. It is now known as No. 3 above on Hunker. It and its mate have produced up in the hundreds of thousands of dollars' worth of gold.

But before its richness became known, the yearly representation work came due, and Henderson, still weak and penniless from a surgical operation and winter of sickness, could not get a reasonable extension of time, and was compelled to sacrifice it for $3,000 (equivalent to $500 outside) to Alexander McDonald, "King of the Klondike." He is from Nova Scotia, and had known Henderson in Colorado.

Owing to official carelessness and delay, Henderson also lost his claim on Quartz Creek.

He continued to prospect on the Klondike, on the Indian River, and on the Stewart River. He was the first to prospect "All Gold" and "Henderson" Creeks, which are now producing gold and will be valuable dredging propositions.

The Department of the Interior have by letter recognized the wrong done the discoverer by the recorder's refusal to record his properly staked claims, but has done practically nothing to compensate him.

The grim irony of a pioneer or discoverer's reward is seen in the despatch from British Columbia, that the Provincial Government have settled an annuity of $600 on Miss Fraser, the daughter of the discoverer of the Fraser River. As Miss Fraser is said to be dying, the generosity of the bequest is quite apparent.

Mr. Wm. Ogilvie, Yukon pioneer and ex-Commissioner of that territory, in giving Henderson the credit for the discovery, added that Carmac nearly lost the credit of being the accidental discoverer of Bonanza Creek. Two days after Carmac had staked, a party of miners searching for Henderson's new strike prospected and staked on Bonanza, several miles below the present discovery claim.

The attempt on the part of Seattle newspapers to give Carmac the credit for the discovery of the Klondike is due to the fact that he settled in that city with his easily gotten money. Robert Henderson, on the contrary, continues his work of exploring the mineral resources of Yukon.

As already pointed out, all the Governors and Acting Governors of Yukon, and all the leading pioneers, have by letter or by affidavit given Henderson the credit for the discovery. Mr. R. G. McConnell, the well-known geologist, who has personally looked into the matter, also calls him the discoverer. His work has added over $150,000,000 worth of gold to the world's supply, and has given Canada a wide and enduring advertisement. Personally, he is a fine type of pioneer and man, and he deserves well at the hands of his countrymen.

LONDON LETTERS.

ALEX. GRAY.

TEMPORA MUTANTUR PRO TEMPORE!

Whoever said mortals could stand everything but continual prosperity, anticipated that prevalent conditions in financial power houses are a species of "rest cure," a hiatus inherently heroic, essential to progression toward greater activity and vigor. "New business" is not being entertained; clearance sales can be made only at very great sacrifice; mining flotations are decidedly taboo; those who have funds are holding on to them; those who have no surpluses are unable longer to carry their deck loads of adversity. If you reverse the order, and instead of taking Medicine Hat forecasts of weather conditions the impasse here is accepted as index to the strains which all markets are subjected to, Canadian industrialism will be in less risk of really serious trouble such as envelops investment as well as speculative lines. There are sorrowings, but few borrowings without abundantly commensurate collaterals, and those seeking fresh capital realize more than ever the force of what Cecil J. Rhodes remarked to "Chinese" Gordon about the futility of "large ideas" when the wherewithal to demonstrate them is absent. Possibly the volume of home trade; the status of American affairs apart from Wall street; the monthly output of Witwatersrand gold, and the earnings of Canadian railways, Canadian bank clearances and what they represent are truer tests than the tapes in brokers' offices. Nevertheless there are so many disconcerting elements, it behooves the *Canadian Mining Journal's* clientele to revise their open transactions, to avoid hazardous commitments, unless liquid assets are certain not to congeal. The world's supply of paper is out of proportion to available funds in circulation, capital expenditure and issues have attained to the point where structural defects in one department threaten marvellous creations of the past ten years. Canada is no inconsiderable incident to the expansion. To preserve Canadian integrity, however, requires that the present reverse in speculative centers shall not result in a dibacle endangering what is merely the preliminary basis for the future exploitation of the natural resources of the Dominion.

Statistics of exports and imports are unimpressive when the banker curtails credits, the small shopkeeper complains of collections, and shrinkages in values become alarming. The economics are sadly askew. Never has London been so disconsolate, consequently so indifferent, to colonial representations. Somehow the investor has been alienated. What he has has the handicap of restricted markets; so we have the *Banker's Magazine* likening a valuation of stock exchange "securities" to "a survey of a district which has been afflicted with some devastating calamity." War wastes aggregating £300,000,000 are comparatively infinitesimal "when compared with the hundreds of millions lost even during the last two years by the depreciation of securities." What has been communicated to *The Canadian Mining Journal* therefore is justified. To be admonitory rather than trench upon the prerogations of the mining promoter who offers scip at a concession that will no longer be obtainable "next week," is preferable, when this carefully edited journal has the following:

[In normal times a net movement of fifty millions one way or the other in the list of 387 representative stocks usually reflects a substantial appreciation or depreciation, as the case may be, but already this year there has had to be chronicled for one month (March) a decline of 125 millions sterling, and now, for the month of August—a month not usually associated with violent fluctuations—there is a depreciation to record of no less than 136 millions, the exact figures being as follows: Aggregate value of 387 representative securities on 20th July, £3,633,717,000; ditto on 20th August, £3,498,130,000—a decrease of £135,587,000.]

Without elaborating these figures to the entire lists dealt in on 'Change in London, to say nothing of New York, Paris and Berlin, they are sufficient deterrents to financiers. Nor is there a compensatory feature beyond concurrent necessity. Where there might have been sanity—in the manner of intramural transportation facilities—a surfeit of official and unofficial competition has created nothing but debit balances, or so reduced profits that dividends are microscopic or are passed. London, for instance, went motor mad, while its underground railways and tubes confess to carrying millions for less than shareholders would receive if they held consols at to-day's prices. The horse omnibus being no longer the fashion, the promoter and motor manufacturer catered to the popular desire, without profit to shareholders, because of ruinous rivalries. Nor is the initial outcome of the latest flotations astonishing when the balance sheet of the London General Omnibus Company for the half year ended 30th June—published to-day—shows a working loss of £52,413. In the period reviewed, 99,836,805 passengers were carried, as against 108,341,451 in the corresponding 1906 period, and the average receipts per passenger per omnibus per day was £2:4:1, as compared with £2:6:2. And this concern is affiliated with the potent name of Lord Rothschild! "Inclement weather and increased competition," are causes assigned. Co-operation in the maintenance of higher fares underground and at surface is now proposed, but fixed charges are more apt to increase than decrease, as has been the case with the steam railways, the chairmen of which are unanimously lachrymose; hence this gloomy contrast btween prices of 1896—the year in which the American movement began—and to-day's quotations:

An advance of about 40 per cent. in the return upon these securities, with money less valuable, would be quite satisfactory were it not for disparities in market prices clearly indicating that the British buyer of to-day is more discriminating than he was a decade ago. These depreciations are arguments in favor of colonial securities and industrial shares yielding higher rates; yet they denote the impotence of purchasing power crippled beyond the patence of those who thought home rails as good as "Goschens." In reality there is little difference, because "Goschens," while indicating a drop of 25 per cent. in market value, are paying 3 1-20th per cent. on current prices, as against 2 3-10th per cent. in 1896. This correlation might be extended indefinitely to prove that public issues, though "gilt edged," are too slow an asset to suit the investor who cannot afford to create a reserve fund against all contingencies. It is contended that as India 3½ per cent. are 20 points; Liverpool 3½, 34 points; London County Councils, 28 points lower, this is "the investor's opportunity." Perhaps it is, but if shrinkages here and in other directions are taken to account, it will be easier to understand the hesitancy of monied people when confronted by municipalizations galore and pro-socialistic legislation ad lib. In the eight months of this year the 387 stocks dealt with by the *Bankers' Magazine* record a loss in market value totalling a third of a billion pounds sterling—111 millions being debited to American rails, 48 millions to British funds, and 36 millions to English railway ordinary issues. American disparities, as enumerated, are only a fraction of losses sustained. South African Mining and Exploration Company shares in August added another 25 per cent. in gall and wormwood to the cup. Not many of these months would spell ruin. Nor have bank shares escaped, since consols on the toboggan were certain to drag all else with them. It could not very well be otherwise where the one tonic available—the Witwatersrand gold—is threatened, and onslaughts are aimed at the public purse and private enterprise by those who maintain the State owes them special benefits as compensation for studied improvidence.

When Lot's wife became concretedly saline, her offence lay in reprehensible retrospection. The old world and a part of the new is nursing many petrified hopes. Canada has less bad debts in her books and a wider range of opportunity, so moralizing yonder may be relegated to futurity, pending the provision of capital to enable it to state terms rather than supplicate for them. What the Mother Country does not know in detail of the Dominion will be learned intelligently. Better so than to have it unlearned in manner and form akin to American land grabs, granger railroads and credit mobilier episodes. To indiscriminately press forward mining and land ventures ahead of transportation and essential economies is to invite activity at the cost of a reputation worth fostering. Taking South African balance sheets of two or three years ago as "horrible examples" of what Lord Milner characterized as "incorrigible optimism," there is need of that prudence which asserts the consciousness of Canada's potentialities and the desire for something other than market rigging. Over-capitalization, gross errors of estimation, bequeathed to South Africa as a heritage of distrust, Canada has the "large ideas" of Rhodes, and the money for them will come along in natural order if the public domain is conserved and the public interest is promoted. South Africa's "Golden Calf" has a "gamey" flavor approaching putridity. Canada is at the portal leading to prosperity. I offer the following as a picture of what is sticking in London's mind's eye:

"The state of things on the Stock Exchange is probably without parallel in the history of that institution. Hitherto the slump has mostly hit the smaller men, but although there have been no hammerings, the careers of two really large firms have been closed since last account, and a number of other quite important houses are known to be facing the situation with haggard anticipations. One wealthy firm in the mining market is discharging its clerks and retiring in disgust and despair from the so-called "business." It is really too bad that the Stock Exchange Company and the Stock Exchange Committee should sit like so many Turks with folded hands and uplifted eyes without attempting anything to "stay the rot." At any rate, an official scale of brokerage, forbidding rebates, would help the commission houses to pay their expenses."

London, August 27th, 1907.

CANADA'S OPPORTUNITY.

Liquidation variously attributed to the slump in American shares, depreciation of consols, and political programmes provocative of uneasiness in big financial houses, combine to deter investors from further commitments. Several Canadian tansactions of moment have been shelved as a consequence, mining ventures are at a discount, banking privileges are restricted, and a period of dearer money is inevitable.

No section of the London and Continental markets concerned has escaped the gruelling incident to operations of late. Probably Canadian corporations and projects have more genuine sympathy, where that element counts for substantial contributions when the spirit of liberality pervades the city; but no secret is made of the fact that large movements are now accompanied by hazard, and will be until Western crop movements are completed. The Rooseveltian crusade against gargantuan combinations is more clearly defined, and the outlook as to the indispensable yellow metal output of the Witwatersrand is less obscure. Canadian industrial undertakings, bona fide and not too precarious, necessarily suffer because of all these complications, but the postponement of impending flotations should not be detrimental. To the contrary, the willingness with which financiers enter into British North American promotions, when properly vouched for, is the very best assurance that your hoizon of hope is broadening; all that is required is a revival of general confidence and fresh demonstration of Canada's capacity. Money is the decisive factor as always. The shrinkage in credits throughout, and the inadequacy of the world's supply of capital for the stupendous volumes of business, are disconcerting to unprecedented degree. With it all, clamorous democracies in various ways are pressing for measures equivalent to modified confiscation of property rights; hence no immediate relaxation in funds is expected. Money has added purchasing power, but sustained losses in so many directions are accepted as admonition all-sufficient by financiers and underwriting syndicates to leave those who sow extremist sentiments to reap remorse.

Were it not for the scrip "jam" there would be more receptivity toward Canada, although Cobalt promotions will have to wait. Consols at 81½ and a "no bottom here" look about South African shares, together with the apprehension reflected in the prices obtaining for home rails, adversely affect the attractions Canadians offer. The "silly season" suggestion that consols be made legal tender at par, despite the readiness of holders to part with them at 82 or 83, is symptomatic of all that is transpiring. To disguise the causes without adopting

remedial policies is to invite topsy-turvitude; so there will have to be universal readjustments—and Canada is specially fortunate in having fewer open accounts.

South Africa is in a woeful plight. Dissension and despair and the impossibility, without cheap labor, of winning gold at a pace to pay interest on share and debenture issues distributed at inflated prices, are argument against mining ventures. Parent company paper represented by cash, cash assets, and fixed property, are worth less than at any time during the late Boer War. A lopping off of £200,00,000 in "Kaffir" market values, minimizing credits closely related, much more than that dissipated in the American dibacle, all conduce toward the distrust reflected in the weakness of consols and British railways. Perhaps Canada has not attained to that pretentious position where it can command capital despite adversity elsewhere. It is well understood that money is a pressing Canadian prerequisite. Your needs can be supplied if the tactics of promoters are directed to the permanent welfare of the Dominion rather than to immediate realizations on forced market opportunities. As one creditable Canadian remarked to an underwriter or overwriter the other day when asked if a "market is at once to be made for certain debentures," "No, sir; that is not my business. You are getting 4½ per cent. debentures at a low price; the flotation promises more than is represented in the prospectus, and if you do not care to hold the security you must make your own market."

To say this involved moral courage. When Canada applies this principle more generally financiers will be less prone to assume that all mining ventures "look alike to me," and that the prospectus is not merely a preliminary to summary offloading by vendors.

When revising a former letter, the impression formed was that the views recorded were doleful, probably to an extent at variance with Canadian perspective. Upon going through the London dailies a day later, I find I have erred on the side of conservatism of statement. The Express, whose financial editor is on intimate terms with an influential section of city men, is the dispenser of the following, the conclusions being well founded, apart from those involving Mr. Roosevelt, who has simply emphasized the evils according to Harriman:

"The financial sky is still gloomy, and before markets sail into smooth waters some dirty weather will probably be met with. Kaffirs have been killed by the Liberal party, and the American market has been assassinated by President Roosevelt—just at the wrong time of the year. A general holocaust of values has been in process, and the absolute certainty of a 5 per cent. bank rate—at least—at an early date is assured. Under these circumstances, to revert to the original metaphor, speculators for the rise may be strictly enjoined to keep off a lee shore and rid themselves of as much top hamper in the way of contango stock as possible while riding out the storm. Fortunately, there never was a time when open accounts in the House were of smaller volume than now, and the bank position is sound enough. For these reasons no panic is to be expected, and there is nothing to justify the jettisoning of good stuff which has been paid for and taken up."

The writer is rather alarming. He is not alone in this, for the financial editor of the Chronicle simultaneously says:

"It is still impossible to discern any encouraging symptoms of a coming improvement in markets. Liquidation continues in various directions, and the stream is by no means dried up. It is no secret that many firms have experienced the greatest difficulty in keeping their heads above water; that many were assisted at the recent settlemnt; that some are still receiving help, but it is to be feared that such troubles cannot be permanently removed except by a sustained and considerable appreciation in prices. Unhappily, such a prospect is not visible as yet, and this patching-over of difficulties cannot remove the anxieties they have created. If we could look for some alleviation from New York, markets might be able to cherish a few hopes, but all authorities agree with what we said yesterday—Wall street must face further liquidation. Professionals tried to cheer each other up yesterday by declaring that the worst of the liquidation is over, but things looked most cheerless all the same. In a very sluggish gilt-edged market Consols were comparatively firm, with a gain of 1-16 to 81 11-16."

Bad weather ahead, succeeding similar weather, justifies the attitude of capitalists. Presently, with a little patience, Canada should, and will no doubt, have its opportunity.

PERSONAL AND GENERAL

The Hon. Robert Drummond, editor of the Maritime Mining Record, has been appointed one of a Commission of four, to report upon the feasibility of old age pensions, for the Nova Scotian Government.

Mr. Louis J. Abrahams, of Ely Place, London, England, left Toronto for New York and England on September 5th.

Mr. J. W. Rawlins, chief chemist of the Canadian Copper Company, Copper Cliff, Ont., is spending his holidays in Toronto.

Mr. A. A. Hassan, mining geologist and consulting engineer, has opened Canadian offices at 25 Toronto street, Toronto, Ont. Mr. Hassan has organized the "Hassan Exploration Company of Canada, Limited." The prospectus of this company was regularly filed in the office of the Provincial Department of Mines.

Mr. Frank Loring has resigned his position as consulting engineer of the Trethewey mine, and will henceforward make Toronto his headquarters. Mr. Loring has done clean and effective work in Cobalt. His advice has been sought by many of the more important interests there, and he has reported upon many of the larger properties. The McKinley-Darragh and Foster were examined and reported upon by him. Mr. Loring, as a citizen of Cobalt, as an employer of labor, and as a mining engineer, has exercised a strong and healthy influence. We wish him all success in his new sphere of activity.

Captain D. J. Kennelly, of Louisburg, died on the 28th of August at the Brooklands Hospital, Sydney, after an operation for cancer, at the age of 76. Captain Kennelly was for many years manager of the Sydney & Louisburg Coal and Railway Co., and resigned his position when that company was merged in the Dominion Coal Co. For many years Captain Kennelly has been a well-known figure at Louisburg, in the historic history of which place he was deeply interested. He inaugurated a movement for the preservation of the ruins of the French occupation there, and endeavored to create a fund for the Louisburg Memorial to the dead of both the nations who fought so gallantly for the possession of this island.

Captain Kennelly had an adventurous and varied career, having witnessed active service in the Indian Mutiny. He was a man of varied attainments, being a barrister of the English bar and a K.C. of this Province.

He was a gentleman of an old school, and a link with the days when our Empire was passing through stirring times. His death removes one of the most interesting figures connected with the earlier days of the Cape Breton coal trade.

EXCHANGES

Technical Literature, August, is replete with information. The leading article is on Canadian hydraulic canal locks.

The Mining Journal, August 17, concludes an editorial article on American and German demand for British iron with the assurance that a brisk autumn trade in most branches of the iron and steel industries is practically certain.

From The South African Mines, Commerce and Industries, July 13, we learn that of the sixty-two Rand companies which earned profits in May, exactly one-half made less than ten shillings per ton. "A considerable proportion of the £780,000 profit which the mines made in May was derived from these ores, which yield profits of less than 10 s. per ton."

The Colliery Guardian, August 16, editorially discussing the timbering of coal mines, alludes to falls of side and roof both in working places and roadways. The Guardian claims that too close observance of the special rules laid down by the British inspectors is one of the causes of these accidents. Although the maximum distance between supports, as fixed by the special rules, is not too great for ordinary conditions, yet the mere existence of a legal limit tends to deter the miner from using his discretion.

The Mining Reporter, August 22, presents an article on a Chamber of Mines recently organized at Los Angeles, California. The Chamber will employ two staffs of inspectors, commercial and technical. Upon payment of certain fees, certificates will be granted to reputable mining companies. The Chamber's certificate and registration seal can, however, only be used subject to certain restrictions. The plan has been tried before without success. But there is no reason why, under present conditions, it should not be successful.

The Mining World, August 24, contains a thoughtful article on Cobalt by Mr. Ralph Stokes, the World's travelling correspondent. In its editorial columns the Mining World expresses the opinion that the needs of initial equipment for Cobalt mines is typically light. A considerable amount of mining has been done with a minimum or very light equipment, but the producing mines have respectably large plants. The irregularity of the veins and the fact that the rock encountered is hard to drill, make the compressed air requirements larger than usual. Another consideration is that on much of the ore shipped only silver values are paid for.

The Iron and Coal Trades Revew, August 16, comments upon the recent advances in colliers' wages. Since June, 1906, for instance, South Wales colliers' wages have advanced from the minimum to nearly the maximum. "What is now earnestly desired," remarks the Review, "is an increased output. . . . Nearly all the principal collieries have paid a dividend of 10 per cent. for the first half of the present year, in addition to having expended large sums in the improvement of plant and machinery, opening out new workings, etc., for the sole purpose of increasing their output. The probability of a bill being passed during the next session of Parliament for limiting the hours of colliers' labor underground has had something to do with this, for as the output per man must necessarily be reduced, a larger number of men must be employed to maintain even the present demand, and foreign consumers may apprehend in this move another advance in the price of coal."

The Monthly Mining Report of the Chamber of Mines of Victoria, Australia, for May, contains an account of the recommendations of a late Royal Commission on State forests and timber reserves. The Commission strongly recommended, among others, the following propositions:

Independent control of the forest reserves and the withdrawal of the administration from ministerial control.

The dedication in perpetuity of "Reserved Forests," which term will include all permanent reserves for the growth of timber, or for climatic reasons, or for both purposes.

The demarcation on the ground of all "Reserved Forests" which have hitherto not been surveyed within a fixed period.

The protection of the reserves and Crown lands from the misuse or careless use of fire.

The encouragement of tree planting in bare, treeless districts.

An unusually luminous editorial is that on "Crystals and Water in Veins," in the Mining and Scientific Press, August 17. After appreciating Waldemar Lindgren's essay on "The Relation of Ore Deposition to Physical Conditions," our contemporary mentions and emphasizes one factor in the distribution of ore in lodes—the water zone. "It is pretty clearly ascertained, especially among mining engineers and others in daily touch with underground operations, that there is a definite layer of water, the *top* of which has long been known as the 'water-level.' The bottom of this zone of water has not been recognized, simply because the sinking of shafts tends artificially to depress it; for the lateral workings of a mine, by draining the adjacent area, cause the shaft to act as a pump. Miners know that at a certain level they get below the maximum seepage, and in large mines the pumps are placed so as to 'take up' that water . . . Below the water zone the lode becomes dry, even dusty, so as to imperil the health of miners."

In the Engineering and Mining Journal, August 24, Mr. Joseph Daniels writes interestingly on "Methods of Paying Miners' Wages." Constant readjustment between the operator and the miner has resulted in a number of systems of payment of wages based on local economic conditions. Day's pay is the simplest and most universal method, and is applied largely to unskilled labor. In the contract system both quantity and quality of work count. In most American coal mines coal is paid for by weight at the bank-head scales, although narrow work is paid for by yardage; the price of yardage being computed on the average number of tons of coal in a cubic yard. In metal mines development work is usually paid for per foot or yard of advance. Under the "Hole Contract" system payment is made at a certain rate per foot drilled. Firing and loading are not included in the contract. The tribute system, in which payment is based on the value of the mineral extracted. The Colorado lease system is based upon the old Cornish tribute system, but it has eliminated many of the latter's uncertainties and disadvantages.

The Chemical Engineer has moved its office of publication from Philadelphia to 355 Dearborn street, Chicago, Ill. The editor's office is still in Nazareth, Pa. The July number of this monthly has a paper by Dr.

Charles B. Dudley, entitled "The Enforcement of Specifications." Dr. Dudley traces the evolution of the specification: "In the early days of specifications they were little more than attempts on the part of the consumer to tell the producer what he wanted. Especially after it became the custom to consult the manufacturer in making the specification, it took on a new meaning. At first it was a demand; it now became an agreement. . . . Testing was never intended to be a device to bring about the acceptance of inferior material, but quite the contrary. . . . Is not the time near at hand when engineers and their principals will be compelled, if not legally, then by force of public opinion, to acquire by the establishment of laboratories and means of testing, by the making and enforcement of specifications, such knowledge in regard to the materials they are putting into structures as will give the public greater security than it now has against disaster."

CORRESPONDENCE

Ottawa, Sept. 5th, 1907.

Dear Sir,—

As the new Department of Mines has been so lately created, and as there seems to be some misunderstanding concerning the authorized status of its branches and chiefs, the Acting Deputy Minister has instructed me, in order to prevent further misunderstanding, to call your attention to certain inaccuracies that have crept into your articles in regard to Mr. A. P. Low and Dr. E. Haanel.

In the first article it is stated that Mr. Low is "Director of the Geological Survey, now officially designated the Department of Mines." The sentence should have read that Mr. Low is Deputy Minister of the Department of Mines and Director of the Geological Survey.

In the second article, Dr. Haanel is made to appear Director of the Department of Mines. That gentleman is Director of the Mines Branch of the Department of Mines, which with the Geological Survey combines to form the new Department of Mines.

In the second article it is also stated that the office of the Mines Department "has been removed to the Thistle Building in Ottawa." This statement is rather misleading. The office of the Mines Department is in the Geological Museum Building, Sussex street, and the Mines Branch has temporary offices in the Thistle Building, Wellington street.

Yours truly,

PERCY H. SELWYN,
Secretary.

The Editor "The Canadian Mining Journal," Confederation Life Building, Toronto, Ont.

BOOK REVIEWS

SHAFT SINKING UNDER DIFFICULT CONDITIONS—BY. J. RIEMER. TRANSLATED FROM THE GERMAN BY C. R. CORNING AND ROBERT PEELE. ILLUSTRATED WITH EIGHTEEN ENGRAVINGS AND NINETEEN FOLDING PLATES. NEW YORK, JOHN WILEY & SONS. LONDON, CHAPMAN & HALL, LIMITED; 1907; pp., 176; 8 VO. CLOTH, $3.00.

This timely treatise is divided into four sections:—I. Shaft-sinking by Hand; II. Shaft-sinking by the Boring System; III. The Freezing Process; IV. Drop Shafts.

I. Section one is prefaced by a statement that may not be accepted by mining men on this continent. The author asserts that no mechanical process of sinking has as yet successfully displaced sinking by hand, "which, when at all applicable, still maintains its predominance over other methods."

In this section reference is made to the use of hanging scaffolds, by means of which masonry lining may be put in place simultaneously with the actual sinking operations. The use of and improvement of the old Cornish pumps, steam sinking pumps and Tomson's method of bailing by means of the permanent hoisting engine are outlined. Stationary pumps are now no longer customary for shaft-sinking.

Records of German shaft-sinking are given and a comparison is instituted between the boring, freezing and drop shaft systems and ordinary hand work. "Sinking by hand will have the preference, both because of its efficiency and lower cost, in every case where it can be used at all, even though the flow of water be considerable." There are, of course, conditions where the flow of water is so great that hand work is impossible.

II. Shaft-sinking by boring an entire shaft in a single operation, carried on under water, is outlined in this section. Originally the procedure was merely an extension of that followed in sinking artesian wells. The adoption of the plan of drilling an advance bore, by a small tool or trepan, from one-third to one-half the full diameter of the shaft, facilitated the removal of drillings and kept the shaft plumb. The method is applied only after a portion of the shaft has been sunk by hand labor and ordinary pumping, and when no further progress by these means can be made. In cases where large quantities of water are anticipated, the use of the boring system would usually be a foregone conclusion. The plant required is large and costly. The trepans used are huge affairs, a smaller size weighing 22,000 pounds and a larger one 52,800 pounds. A full description of the process and its limitations is given in this section. Complete data of actual operations are included in narrative and tabulated forms.

III. The Freezing Process, brought out by F. H. Poetsch in 1883, had been used in Wales in 1862. In Siberia the severe climate permits of the alternate freezing and excavation of the shaft bottom.

The process is applicable to soft and unstable ground, containing large quantities of water, in which ordinary hand-sinking cannot be carried on. The modern improvements of the process are touched on and operations are adequately described in this portion of the volume. Logs of shafts sunk in Germany, Belgium, the United States, Holland, France, England and Austria, are tabulated.

IV. The Drop-shaft method for sinking in sand or loose water-bearing soils is one of the oldest in use. The method originally consisted in erecting a strongly framed rectangular wooden casing and allowing the casing to sink slowly into the shaft as it was being sunk. The wooden casing was succeeded by a circular walling of masonry, first with a wooden, afterward with an iron, shoe. A plate iron cylindrical lining and, later, a cast iron tubing with machined joints superseded this. Drop-shafts were first sunk by their own weight; then by loads of earth, stone or iron; and eventually by the use of jack-screws and hydraulic jacks. In modern practice a large number of hydraulic jacks are connected with an accumulator, weighted for exerting a constant pressure on the drop-shaft.

The weaknesses and causes of failure in this variety of shaft-sinking are well illustrated by another series of working instances. As in the preceding sections, precise and exact data are included.

The volume is supplemented by a series of folding plates.

As the scope of Canadian mining is increasing, conditions must arise more frequently under which shaft-sinking in loose and watery soil will be necessary. A book such as this contains a mass of information invaluable to the mining engineer who must sink a shaft under such circumstances.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

SPRINGHILL.—The strike in Springhill still continues. It is to-day wearing its most serious aspect. Many may wonder what has caused such a condition of affairs. The local papers have done much to muddle the public as to the cause of the present trouble. A certain number of miners in a section of the mine demanded an increase on the price per box, for which the management considered they were already receiving top prices. The management refused the advance. The men referred the dispute to a Board of Conciliation under the Lemieux Disputes Act of 1907. The management were very willing to allow the matter to go before the Board. The Board was therefore legally appointed. Two cases were given the Board to decide. The Board sat for three days, giving ample time to bring forward all possible evidence from both sides. The Board at its final sitting awarded one case to the men, and the other, including the increase of price per box, was awarded in favor of the company. In the meantime the men made reference to another Board for settlement of a difference. This also was accorded them. The men, however, previous to this had got notice of the awards of the former Board, and at a meeting of the lodge repudiated the finding of the Board, and further notified the management that if their demands were not conceded in full they would strike on August 1.

The new Board met on July 31 and the miners presented their side of the question. The court adjourned to meet the following day. On the evening of the 31st July a meeting of the lodge was held, with two hundred and fifty present out of nine hundred members, one hundred of whom were disqualified as voters on account of non-payment of dues. A secret ballot was taken amongst those qualified to vote, which resulted in ninety (90) voting for strike and sixty (60) against. By such a small majority were the town and works plunged into all the loss and anxiety of this disastrous suspension of work. According to adjournment, the new Conciliation Board met on the morning of August 1 to continue the investigation; but as the men were on strike on the finding of a former Board, the Chairman (Judge Patterson of Pictou County), after expressing his regret at the action of the men, quietly adjourned the Board to meet again when needed or called for.

Many of the men have left the town for other localities, a few temporarily. Many of those not in favor of the strike have found jobs as near at hand as possible, waiting for the works to start again. A few of that class who care little whether they work or play are hanging around and working odd days on the streets. A system of alms-giving has been established by the labor organization to which these men belong, and it does not say much for the manhood of our Nova Scotia miners when they prefer that to an average wage of $3.34 per day made by honest work, even in the places where this increase was demanded. It is to be regretted that the law-abiding element which we know really exists among the men, is not more in evidence. Were it so, law and order would prevail, and much suffering be averted. The management in not conceding the workmen's demand in this instance is simply upholding law and right.

W. D. M.

SPRINGHILL, Aug. 27.—The strike still continues. All of the horses are taken out of the mines. The officials and a very few laborers are working to keep the mines in running order. The mechanics—engine men, pump men, etc.—are still at work, although it was thought at one time that they also would join the strikers. However, the wiser element prevailed.

The company has placed weigh scales on Nos. 2 and 3 bankheads for the purpose of weighing the coal as it comes from the mine. Hence a new era will be established in the method of paying miners for their work. Previous to the strike the coal cutters were paid by the car; hereafter they will be paid by the ton.

There is nothing as yet to indicate a breaking of the strike. The strike itself is remarkable for the very quiet manner in which it is being carried on. There is some newspaper skirmishing going on however.

Quite a number of men have left the locality, some going west, but the majority scattering to the neighboring mining localities. These latter intend to return as soon as a settlement is reached.

Some places of business have closed their doors. Others are open, hoping for peace in the near future. All are anxious, as the situation is becoming desperate for the town and its people.

HALIFAX.—At the Annapolis Iron Company's Torbrook mines, No. 2 shaft is down 150 feet. The Dominion Atlantic Railway extension to the mines is nearing completion. No. 1 shaft will presently be reopened. It was closed down whilst the Londonderry furnace was under repair. The furnace will very soon be put in blast again, and ore shipments from No. 1 shaft will then be resumed.

No. 2 shaft is being sunk on a superb body of high-grade hematite. The ore is holding in quality and quantity as sinking proceeds. Levels will be driven at 80 feet, 160 feet and 240 feet. Thirty-five men are now employed in this shaft.

September 9th is the date set for resumption of work on No. 1. The management will then need about seventy-five men.

Recently Mr. T. J. Drummond, of Montreal; M. Woodward, of Paris; and Mr. W. F. C. Parsons, the mining engineer of the company, inspected the mines and visited several places near Annapolis, where they examined proposed sites for shipping piers for the company. The shipment of ore to domestic and foreign consumers is part of the plans of the company. At present the Londonderry Iron and Mining Company's blast furnace at Londonderry, Colchester Co., is the only user of Torbrook ore.

SYDNEY, N.S.—The executive of the Dominion Iron and Steel Company has decided to make Wabana iron ore a source of revenue. Larger installations will be put in and ore will be mined for sale and export. Moreover, the company's coal areas are to be developed. Both of these moves are wise.

QUEBEC.

LABELLE.—Mr. E. A. Howarth, of the Morgan Crucible Company of London, England, visited the Labelle Mining Company's mine on August 19th. Mr. Howarth was exceedingly pleased with the showing of graphite and the quality of the mineral. His inspection was made with a view to purchasing the property for his firm.

The Northern Mines, Limited, controls the surrounding country and has a prospect that thoroughly warrants development. It is situated one mile from the C. P. R., and a spur line to its mine is nearly finished. The district here is well worth investigating.

BRITISH COLUMBIA.

THE KOOTENAYS.—The scarcity of coke, that commodity which is so essential to the mining and smelting industry of this district, reached an acute stage a fortnight or so ago, resulting in the partial suspension of mining and smelting operations and the temporary laying off of many mine and smelter employees. Shipments of ore were cut down and many of the blast furnaces were "blown out." However, the general public accepted this condition in a philosophical spirit, and everyone felt that a few weeks would see things much changed for the better. These hopes have been realized to a limited extent; coke has been coming into the district a little more freely; but still there is more or less of a shortage. Ardent overtures have been made to the Government and at the present moment Mr. R. F. Tolmie, Deputy Minister of Mines, is in this territory investigating the coke question. Much complaint is heard of the Crow's Nest Pass Coal Co. shipping large quantities of coke to smelters on the American side, contrary to the terms of its charter, when the coke is really required in British Columbia. Exception is made to the Northport smelter, which treats the ores of Le Roi mine, Rossland. It remains to be seen what foundation there is for this cry. It is stated there are two sides to the story.

There is a marked shortage of labor along the Crow's Nest Pass Line of the C. P. R., and many of the employees of the coal mines have gone to work in the fields. This lack of help is likely to continue until after harvesting is over.

There is also more or less shortage of cars throughout this country, but relief is expected in this quarter in a short time.

The decided drop in the price of copper has naturally thrown a shadow across the bright path which the copper propositions were following.

At Rossland the Consolidated M. & S. Co. have cut down their ore shipments and are devoting their attention to development work. Le Roi is not shipping ore, with the exception of about 680 tons on Aug. 30th, which had accumulated in the bins during development which they are carrying on. The mine on the 1650 level is in good condition, the important work they have had in hand there now being nearly completed. The Northport Smelter is closed down completely, but coke is accumulating in their bins and operations will be resumed, it is stated, in a couple of weeks at most. The Trail smelter of the Consolidated people is running light, coke being scarce with them too. Development work is being actively prosecuted at the Le Roi 2, Limited; Giant-California, Jumbo and White Bear. Le Roi 2, Limited, and White Bear are on the shipping list. Rossland ore shipments were 3,485 tons for week ended Aug. 31st.

In the Boundary Country the coke shortage has affected them more or less. At the present writing ten out of fourteen blast furnaces there are in operation, but it is nip and tuck to keep them going. Granby are operating five of their furnaces, B. C. Copper Co. two, Dominion Copper Co. three. The usual mining operations have been carried on.

The big consolidations seem to have great faith in Phoenix camp, and affairs with that town look bright. The Granby, B. C. Copper Co., and the Consolidated people have each bonded a number of claims and are prospecting them with a view to purchasing those which prove of value. The shipments of ore from the Boundary amounted to 22,811 tons for the week ended Aug. 31st.

Diamond drilling is being done on the B. C. Copper Co.'s Oro Denoro property. The Granby Company is placing an order for coke in the East to insure a plentiful supply. The Granby has a force of about twelve doing development work on its Independence property in the Similkameen. Boyles Bros. have just finished doing 1,000 feet of diamond drill work on the Boundary-Elkhorn Company's property.

The recent cave-in at the Granby's Brooklyn Mine, Phoenix, has disclosed a hitherto unsuspected ore body.

At the Consolidated Company's St. Eugene property at Moyie more men are now employed than have been for some time. The usual output of ore is being produced and special development work under way.

The Sullivan, Rambler, Krao, Payne and other mines in Slocan and East Kootenay districts are working steadily along the usual lines.

With a plentiful supply of coke, sufficient labor, and a reaction in the price of copper, mining affairs here and in the Boundary would brighten up materially.

ONTARIO.

WABIGOON.—A party of directors and stockholders of the Victory Gold Mine, accompanied by Enrique Tonceda, C.E., M.E., made a lengthy examination of their mines and areas. The Paymaster, the Detola and the Laurentian Mines were also visited.

COBALT.—The bulk of Cobalt ore shipments still go across the border. Of the 1,237 tons shipped during August only five cars went to Copper Cliff, one to Toronto, and one to Swansea.

At the Coniagas, 3,000 feet of cross cutting and drifting has been driven. The concentrator will be in commission some time in September.

Diamond drilling exploration is being carried on actively at the Trethewey. Almost full shifts are worked at this mine.

The Drummond Mine is operating once more. It has a fair complement of men and drills.

The Imperial Cobalt, otherwise and better known as the Evans Mine, was the first shipper from Portage Bay. Mr. J. W. Evans, after whom the mine takes its name, was one of the pioneers of the Portage Bay district, and his mine was the first to make a shipment. The shipment, consisting of about 20 tons of high grade Cobalt ore, was made some eight or ten weeks ago. The Evans is a cleanly handled, well-equipped mine. It is distinctly encouraging that on the Edison Mine, in the same district, a six-inch cobalt silver vein has been discovered. The Portage Bay district is now put on a more promising footing.

The stamp mill on the McKinley-Darragh is running. Ore from the dump is being crushed. This is the first ore reduction plant to be put in commission in Cobalt.

The Cobalt Lake Mining Company is soon to ship three or four cars of ore. Superintendent Fralick has sunk No. 4 shaft to a depth of 110 feet, and drifting at the 85-foot level is progressing. When the shaft has attained the depth of 150 feet drifting will be commenced under the lake. The possibilities of drifting at the 85-foot level are limited. At that depth a drift would cut into the lake if continued too far.

Night Hawk Lake is situated about 90 miles, as the crow flies, north of Cobalt. But a much longer distance must be travelled before the prospector who leaves Cobalt with the lake as his objective point, reaches his destination. Night Hawk Lake is at the head waters of Frederickhouse River, which joins the Abitibi to the north. It is reached from MacDougall's Chute on the T. & N. O. Railway (about 100 miles north of Cobalt). A short paddle on Black River (a tributary of the Abitibi) until the Abitibi is reached. Ten miles down the Abitibi, at Iroquois Falls, a landing is made. After Bartlett's Camp (six miles on a wagon road) is reached, a portage of over a mile is taken to Wilson Creek, then Frederickhouse River is entered, Frederickhouse Lake, and at last Night Hawk Lake. Night Hawk is about 13 miles long and seven miles in width.

On Saturday, 31st August, the new compressor on the Right of Way was started. The new hoist has been shipped and Supt. Houston will soon have his full complement of men at work.

The "Rothschilds" Mine has been closed down. On the Rochester, which it adjoins, good finds have been made recently. Three shafts have been sunk to a depth of about forty feet each on the Rothschilds, but all the work has been carried on without much system.

La Rose shaft is now down 340 feet. On the three levels about 1,800 feet of drifting has been done. Most of this is on

the first level. Fully 1,000 feet of cross cutting also has been performed. The old La Rose shaft on J. B. 4 is to be made the main shaft. Work has been started on it.

The Foster Mine shipped a carload of cobalt ore to Swansea, South Wales, and one of No. 1 ore to the Copper Cliff Smelter, about August 21st.

The reported finds of gold at Night Hawk Lake are attracting many prospectors. Two Swedes are said to have found a ledge.

SAULT STE. MARIE.—After operating for two years without cessation, the plant of the Algoma Steel Company was closed down on August 21st. The rail mill, the capacity of which is 500 tons per day, is in need of repairs, and blast furnace No. 1 is to be relieved. Operations will be resumed early in September.

The Helen Mine, which has in its short life shipped over one and one-half million tons of high grade iron ore, will this summer increase its shipments by about 50,000 tons. The plant of this mine, which was last year destroyed by fire, has been replaced by very modern equipment and buildings. Mr. Seelye, the efficient superintendent, has worked the mine with a high degree of sound economy.

The newly organized Canadian Smelting and Refining Company hopes to have its new smelter completed within six months. It is announced that Otto Stalmann, of Salt Lake City, is to be general manager. The plant is to have a capacity of 125 tons of ore, and will treat Cobalt and other ores. It is doubtful if construction can be completed as rapidly as the directors hope.

GENERAL MINING NEWS

BRITISH COLUMBIA.

Victoria.—Mr. Tolmie, Deputy Minister of Mines, left Victoria on August 23rd for the Kootenay district. Mr. Tolmie is to report to the Executive Council upon the present situation and the future outlook of the coke supply. The Government is prepared to act decisively in this direction.

Kamloops.—Mica, of good quality, has been discovered near Tete Jaune Cache, Cariboo. Mica has already been mined in the district.

Cranbrook.—The Payroll mine has begun shipping its rich telluride gold over to Trail.

Ashcroft.—The Slocan-Cariboo Mining & Development Company, operating on Canadian Creek, has suspended work for the season on account of difficulties with water in the shaft.

Princeton.—Coking coal has been found on the north fork of Granite Creek, four miles from the town of Granite Creek. A 200 foot tunnel has been driven.

Nicola.—The Nicola Coal & Coke Company, whose workings are on the Coldwater, are shipping coal steadily. Developments promise a much increased output before the end of the year.

The Diamond Vale Coal & Iron Company are sinking a second shaft. They will soon become producers.

Mount Sicker.—The Tyee Copper Company is conducting diamond drill prospecting on the 500 foot level of the X. L. Mine.

The Lenora Mine is storing ore in bunkers. Shipments will be made when the railroad work is finished.

Coast District.—The Britannia Mine, situated on Howe Sound, and connected with the shore by an aerial tramway 3 1-2 miles in length, has struck a large chute of payable copper ore on the new Jane tunnel. The mine is located on Britannia Mountain, 3,500 feet above sea level. The plant is entirely operated by water power.

Atlin.—The Atlin Consolidated Mining Company is handling a large amount of gravel by means of steam shovels. The company reports good clean-ups for the summer. The North Columbia Gold Mining Company is enlarging its hydraulicking outfit.

Slocan District.—The American Boy Mine, last year a considerable shipper of lead and zinc ore, has been leased to J. P. McGuigan for eighteen months.

The Hewitt Mine, including a group of claims covering about 400 acres, on Four Mile Creek, three miles from Silverton, has been acquired by Olcott Payne and a syndicate of his associates. The price is reported to have been $250,000, of which $75,000 was cash. Approximately 9,00 feet of development has been done, including a series of tunnels, which open the mine to the 700 foot level.

Fernie.—The Crow's Nest Pass Coal Company is laying out a townsite at Michel. The company has announced that it will sell the lots cheap to bona fide miners, in order of application, and employes of the company. The agreement will require the man to whom the lot is sold to build a dwelling house on the lot within a reasonable time. An important part of the agreement also is a clause prohibiting the sale of liquor upon the premises.

Rossland.—To put a stop to the exportation of coke, the advisability of an imposition of an export duty is being seriously discussed. Advocates of this measure recommend a duty of $2.50 per ton. This would certainly keep British Columbia's coke output within the Province's borders and would tend largely to relieve the shortage.

Boundary.—Ten stamps are dropping at the Cariboo-McKinney mill. Ten more are under repairs now and will very soon be dropping.

ALBERTA.

Lethbridge.—The Diamond Coal Company, whose collieries are situated on the north bank of the Belly River, six miles from Lethbridge, owns 1,924 acres of surface rights, 5,134 acres of mining rights and a townsite comprising 320 acres. The bankhead, power houses, etc., are now under construction. The main tunnel of the workings is now over 1,000 feet in length. A small quantity of coal has already been mined and marketed.

YUKON.

Dawson.—The Guggenheims are installing three dredges on Humble Creek. Among the Hunker mills, the Temperance, Delhi, Whisky, Nugget, Australian and some others are not included in the Guggenheims' concession.

MINING NEWS OF THE WORLD

GREAT BRITAIN.

On August 10th the Conciliation Board for South Wales and Monmouthshire granted the miners an advance in wages of 5 per cent. Three months ago, Lord St. Aldwyr awarded an advance of 11 1-4 per cent. The wages rate now stands only 2 1-2 per cent. below the maximum. Other advances of wages have been conceded in coal mining districts.

In the month of May of the current year the copper smelters of the Urals produced 663 tons of copper.

Important new discoveries of platinum have been made in the Northern Urals, on the Koiva river.

AFRICA.

Mr. Walton gave notice in the Cape House of Assembly on August 19th that he would move for the imposition of a profit tax of 10 per cent. on diamond and copper mining companies earning over £50,000 per annum.

MEXICO.

Electric power is to be transmitted from Guadalajara to Etzatlan and Hostolipaquillo districts. The price fixed is about $100 per horse-power per annum.

STATISTICS AND RETURNS

British Columbia copper ore shipments for week ending August 24th:—

Boundary Shipments:—Week, 22,415; year, 761,798.

Rossland Shipments:—Week, 5,313; year, 173,872.

Slocan-Kootenay Shipments:—Week, 3,007; year, 85,193.

The total shipments from the mines in the above districts for the past week were 30,738 tons and for the year to date 1,020,863 tons.

Following are the figures of copper ore output of the Boundary, B.C., district, for July, 1907:—

From Granby mines	80,216
From Mother Lode	21,040
From Emma	350
Oro Denoro	4,556
From Brooklyn	6,799
From Rawhide	9,421
From Idaho	1,913
From Sunset	5,153
From Mountain Rose	514
From Snowshoe	20,840
From Providence	30
From Skylark	20
From Sally	25
Total for July	150,873

CROW'S NEST COAL.

The output of the collieries for the week ending August 23rd was 19,199 tons; daily average, 3,200 tons.

COBALT ORE SHIPMENTS.

The ore shipments for the week ended August 24 totalled 315 1-4 tons. It is understood that one of the Coniagas cars was of high grade ore, but that they are withholding shipments until the new smelter gets running. The shipments in detail were: Nipissing, 126 tons; Coniagas, 61 1-4 tons; Townsite, 33 tons; Foster, 33 tons; Kerr Lake, 32 tons; Buffalo, 32 tons.

DOMINION COAL COMPANY.

Outputs, August, 1906, and 1907:—

	Tons. 1907, approx.	Tons. 1906, actual.
1	44,670	45,825
2	58,610	54,741
3	32,910	38,464
4	43,100	50,886
5	60,700	54,977
6	19,830	9,933
7	.....	11,891
8	21,380	24,566
9	27,700	35,959
10	7,730	4,274
	316,630	331,716
Shipments	371,982	343,789

COBALT ORE STATEMENTS, WEEK ENDING AUG 31ST.

Following are the weekly shipments from Cobalt camp, and those from January 1 to date:—

Buffalo—Week ending Aug. 31, ore in pounds, 100,000; since Jan. 1, ore in pounds, 1,618,830.

Coniagas—Week ending Aug. 31, ore in pounds, 160,500; since Jan. 1, ore in pounds, 4,368,820.

Kerr Lake (Jacobs)—Week ending Aug. 31, ore in pounds, 61,000; since Jan. 1, ore in pounds, 373,780.

Nipissing—Week ending Aug. 31, ore in pounds, 65,140; since Jan. 1, ore in pound, 3.764,441.

Trethewey—Week ending Aug. 31, ore in pounds, 65,000; since Jan. 1, ore in pounds, 1,411,018.

The total shipments for the week were 451,640 pounds, or 225 tons.

The total shipments since Jan. 1, 1907, are now 17,016,460 pounds, or 8,508 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2,144 tons, valued at $1,473,196; in 1906, 5,129 tons, valued at $3,900,000.

The total shipments for the month of August amounted to 1,237 1-2 tons, or about 34 tons less than in July. There were thirteen shippers, the leaders being the Nipissing, with 468 1-2 tons, Buffalo next with 180 tons, and Coniagas third with 123 3-4 tons. Shipments in detail were:—La Rose, 2 cars, 42 3-4 tons; Nipissing, 16 cars, 468 1-4 tons; Nova Scotia, 1 car, 33 tons; O'Brien, 1 car, 30 1-2 tons; Drummond, 1 car, 21 1-4 tons; Buffalo, 6 cars, 180 tons; Silver Queen, 3 cars, 88 tons; Coniagas, 4 cars, 123 3-4 tons; Kerr Lake, 2 cars, 62 1-2 tons; Trethewey, 1 car, 32 1-2 tons; Foster, 2 cars, 62 tons; Townsite, 1 car, 33 tons; total, 1,237 1-2 tons.

Cobalt's shippers for the first eight months of 1907 have been:

	Tons.
Coniagas	2276.34
Nipissing	1893.74
O'Brien	1277.46
Buffalo	949.62
Trethewey	680.24
La Rose	405.84
Silver Queen	326.28
Kerr Lake (Jacobs)	187.60
Foster	158.18
Townsite	101.11
Green-Meehan	98.39
MacKinley-Darragh	94.60
Temiskaming	86.04
Cobalt Central	77.33
Right-of-Way	65.55
Temiskaming Cobalt	59.91
Temiskaming & Hudsoy Bay	49.67
Nova Scotia	48.00
Colonial	40.28
University	30.69
Drummond (is storing its ore)	22.00
Silver Leaf	21.76
Red Rock	20.00
Imperial (Evans)	18.96
Total output for 1907 (8 months)	9989.59

or an average monthly output of 1118 tons.

COBALT ORE SHIPMENTS.

Following are the weekly shipments from Cobalt camp:—

Buffalo—Week ending Aug. 24, ore in pounds, 60,000; since Jan. 1, ore in pounds, 1,518,830.

Coniagas—Week ending Aug. 24, ore in pounds, 128,140; since Jan. 1, ore in pounds, 4,208,320.

Foster—Week ending Aug. 24, ore in pounds, 64,000; since Jan. 1, ore in pounds, 256,350.

Kerr Lake (Jacobs)—Week ending Aug. 24, ore in pounds, 63,780; since Jan. 1, ore in pounds, 312,780.

Nipissing—Week ending Aug. 24, ore in pounds, 247,055; since Jan. 1, ore in pounds, 369,301.

Townsite—Week ending Aug. 24, ore in pounds, 66,000; since Jan. 1, ore in pounds, 150,078.

The total shipments for the week were 628,975 pounds, or 314 tons.

The following are the figures of German consumption of foreign copper for the months January-July, 1907:—

	Tons.
Imports of copper	73,732
Exports of copper	4,969
Consumption	68,763

as against consumption during the same period in 1906 of 68,659 tons.

Of this quantity 57,532 tons were imported from the United States.

New Dividends

The directors of the Granby Consolidated Mining & Smelting Company have declared the regular quarterly dividend of 2 per cent. and 1 per cent. extra, payable Sept. 30th. Books close Sept. 13th and re-open October 1st.

METAL, ORE AND MINERAL MARKET.

Aluminum, No. 1 grade ingots—45 to 47 cents per lb.
Antimony—8 1-2 to 11 cents per lb.
Arsenic, white—7 1-2 to 7 3-4 cents per lb.
Barytes, crude—$11.25 to $14.75 per short ton.
Bismuth, metal—$1.50 to $1.75 per lb.
Cadmium, metal—$1.30 to $1.35 per lb.
Carbons for drills—$75 to $85 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, metal pure—80 cents per lb.
Cobalt, f.o.b., Cobalt, Ont., unrefined—25 to 40 cents per lb.
Corundum—7 to 10 cents per lb.
Feldspar, ground—$12 per short ton.
Flourspar, lump—$10 per short ton.
Graphite, domestic—$50 to $150 per short ton.
Gypsum, lump—$4.50 per long ton.
Infusorial earth, ground—$15 to $30 per ton.
Lead—5.25 cents per lb.
Manganese, pure metal—75 cents per lb.
Mica, ground—$50 to $80 per short ton.
Mica, scrap—$15 per short ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 90 per cent. pure—$4.50 to $5.00 per unit.
Nickel, metal—45 to 65 cents per lb.
Platinum, scrap—$21.50 to $22.50 per ounce.
Pyrite—38 to 45 per cent. sulphur, lump ore, 10 1-4 to 11 1-2 cents per unit.
Quicksilver—$40 to $41 per 75 lb. flask.
Sulphur—$23 per long ton.
Talc—$18 to $25.00 per ton.
Tungsten, pure metal—$1.28 per lb.
Tungsten ore, 60 per cent. pure—$9 per unit.
Tin—37 cents per lb.

MARKET NOTES.

Spelter.—Light demands still continue. Prices are falling. New York, 5.45 cents per lb.; London, £21 7s. 6d. per long ton.

Lead.—Market fixed. New York, 5.25 cents per lb.; London, £19 10s. for Spanish lead.

Tin.—Market shows steadiness and upward tendency. New York, 37 cents per lb.; London, £168 5s. for spot.

Copper.—The official price of copper has been reduced to 18 cents. Some transactions are closed at even lower price. New York, electrolytic, 17 1-2 cents per lb.; lake, 18 1-8 cents per lb.; London, £74 10s for spot standard.

Silver.—Aug. 15, 69 1-8; Aug. 16, 69 1-8; Aug. 17, 68 7-8; Aug. 19, 68 5-8; Aug. 20, 68 1-8; Aug. 21, 68 3-8; Aug. 22, 67 7-8; Aug. 23, 67 3-4; Aug. 24, 68 1-4; Aug. 26, 68 1-4; Aug. 27, 68 3-8; Aug. 28, 68; Aug. 29, 67 7-8; Aug. 30, 68 1-4; Aug. 31, 68 3-8; Sept. 3, 68 3-8; Sept. 4, 68 1-4.

Mexican dollars, 52 1-2 cents. Sterling exchange $4.862.

Pig Iron.—Pittsburg—Bessemer pig, $22.90; No. 2 foundry, $22.25.

Iron Ore.—Bessemer, old range, $5; Bessemer, Mesabi, $4.75; non-Bessemer, old range, $4.30; silicious, non-Bessemer, $2.50.

Quicksilver—$40 to $41 per 75 lb. flask.

THE MINERAL ROD.

A curious survival is the "Mineral Rod." There are still extant "practitioners" of the art of discovering mineral deposits by means of the bifurcated rod. Their methods are various and peculiar. The "diviner" usually claims to have some compound of virtue so signal that by its aid he can detect the presence of the precious metal under any conditions. Several of the older school assert that the delicacy of the rod permits of their differentiating as to the character of the mineral lode. These men, more often than not, are firm believers in their own ability to carry out their boasts. Hardly can they be convinced by failure and never can they be enlighted by argument.

Many years ago, a mineral rod man in an Eastern Province of Canada was put to the test. The manager of a gold mine questioned him concerning his powers, and asked him specifically if he could detect the presence of gold in quantity within the mine office. The diviner assured the manager that there was no limit to his powers. Thereupon the manager stumbled against a chest from which came a metallic jingle. The noise and the apparent confusion of the manager convinced the "rod" man that gold was hidden in the chest. He therefore seized his rod, which immediately responded to a powerful current of influence from the chest. Bit by bit, as the diviner circled the room the attraction of the chest became more pronounced. At last, with an exclamation of triumph, he declared that the gold was hidden there.

At once the manager opened the chest. Within it was a piece of brick placed in a capacious toilet vessel. The "metallic" sound had emanated from these.—The "diviner" still divines; but he shook the dust of that particular mine from off his feet.

There are many who believe that the phenomena accompanying a mineral rod demonstration are merely the result of the unconscious contraction of certain muscles in the fore-arm of the practitioner. Others think that there is a sub-stratum of virtue in the rod, but that its functions are over-estimated by its followers. However, there is but scant ground to attribute to the rod any virtue beyond that of causing men to dig. Occasionally they dig, at the bidding of the rod, and in spite of it they make a find. This apparently happens often enough to keep the dying belief in a state of flickering life. Sooner or later, like the mammoth, the mineral rod and its believers will have become the shadow of a name.

Always throughout the history of our race men have been searching for short cuts to wealth. Providence, however, has so disposed the hidden wealth of earth that men must work to win it. It is altogether a beneficent dispensation that this is so. Canada in developing her mines will also develop a breed of men, strong, self-reliant, unboastful and competent. Unboastful they will be because men who wrestle with elemental nature learn rapidly the absurdity of loud speech; competent they must become, because our standards of efficiency are every day growing higher and higher. In this process of growth superstition and ignorance will be sloughed as an old and clumsy garment. Mining will be, is now, the vocation of men, of strong men and above all honest men.

WANTED

Mining Graduate (McGill) desires a position in Cobalt or vicinity as Superintendent or Foreman with reliable Mining Company. The applicant has had several years in Montana in the practical work of Mining and Concentrating. At present he is Superintendent of a Mining Company.

Address :—"Montana,"
c/o Canadian Mining Journal.

MINING PROPERTIES WANTED.

Prospectors and others wishing to dispose of Mining Claims or undeveloped Mines in Ontario or Quebec, can communicate full particulars to the address below.

The properties will be examined by competent mining engineers, and if satisfactory, arrangements will be made to buy the same.

Address, General Post Office, Box 481,
Toronto, Canada.

I WILL GRUBSTAKE

PROSPECTOR and develop the find, if showing warrants. Don't waste your time writing me about ordinary opportunities ; I'm deluged with such.

J. B. SPERRY, 18 BROADWAY, NEW YORK.

IRON AND PYRITES CLAIMS FOR SALE

Several undeveloped iron claims and several partially developed pyrites claims, within one mile of line of Canadian Northern Railway, 50 miles west of Fort William ; and an undeveloped copper and silver claim near Nipigon, for sale.

Particulars P.O. Box 512, Fort William, Ont.

WANTED AT ONCE.

Young mining graduate with some practical experience to do some work in the province of Ontario. Apply at once to

Fritz Cirkel, M.E., 80 Stanley St., Montreal

FOR SALE

Good mica claim—mica in paying quantity. Also two claims in Temagami, showing Cobalt bloom and giving good assay of silver. Excellent opportunity for investment.

For full particulars apply to

A. Valois, Box 54,
Mattawa, Ont.

FOR SALE

A valuable property of Iron Pyrites in the Township of Madoc, about 1½ miles from the Bay of Quinte Railway. Two veins 11½ feet wide and 6 feet wide respectively of high grade pyrites, averaging 52 per cent. sulphur. Mining cheap. Veins have well defined walls. Mine is on side of high hill.

For further information apply to

S. Wellington, Box 63, Madoc,
Wm. Cross, Box 150, Madoc.

MINING MACHINERY FOR SALE

Splendid opportunity to secure some good machinery far below the price of new and all or any part of it can be delivered on the cars in one week.

One Class D Rand Cross Compound Condensing Duplex Air Compressor having a capacity of 835 feet of free air and will run 10 No. 2 Rand Drills. High pressure steam 14 x 24, low 22 x 24, air cylinders each 14 x 22. Has Myers' patent steam cut off valves and machanically operated air valves. Machine good as new.

One double cylinder, 10 x 16, Lidgerword Hoisting Engine. Drum, 54-inch diameter and holds about 700 feet of wire rope without overlapping. End friction and friction hand break. This machine is as perfect as the day it left the shop.

Lots of Steam Pipe ranging from 2 to 5 inches.
Light Steel Pit Rails about 14 pounds.
Steel Piping Tools from 2 to 5 inches.
One Heavy Duty Steam Mining Pump.
One Northy Duplex Steam Boiler Feed Pump.
Rand No. 2 Rock Drills and Barrs.
Rock Drill Steel ready for machines and in good lengths.
One 15 H. P. Steam Engine.
One 25 H. P. Steam Engine.

These engines would be just the ones for a saw mill or could be used as a pumping engine for a mine. Steel Ore Car Bodies just the thing for underground work. This lot of odds and ends will be sold low for cash.

For particulars address, G. M. this paper.

ROOF RIGHT NOW

There is one roof that saves money because it will last 100 years. Guaranteed in writing for 25 years.

"OSHAWA" GALVANIZED STEEL SHINGLES

This roof saves you work because its so easy to put on (do it yourself with a hammer and snips), and save you worry because they fireproof, windproof and weather-proof the building they cover. Write us about it and hear all about 207 ROOFING RIGHT. Address

The PEDLAR People (Est'd 1861).

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

SAULT STE. MARIE, CANADA

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

Underwood

Accurate alignment is an essential of good typewriting; not merely good alignment, but permanently good alignment.

The Underwood has a guide which compels every character to appear in exactly the right position.

The principle of this guide is fully protected by our patents. Other typewriter manufacturers have been working overtime in the endeavor to circumvent us in the matter of a guide—without success.

Without it their machines must continue to occupy their present position—of inferiority. Write for catalogues.

United Typewriter Co., Limited, Adelaide St. East, Toronto

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8.50. Special to readers of this paper **$5.00**

1 000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper ..... **.90**

500 Working Jackets, of striped moleskin and duck in khaki, brown and slate. Regularly $2.00 apiece. Special to readers of this paper **$1.25**

Underwear, Shirts, etc.

Men's Heavy Scotch Wool and Fleece Lined Underwear, guaranteed unshrinkable, non-irritating, overlocked seams, elastic ribbed cuffs and ankles. Sizes 34 to 46. Regular value, 90c. garment, per garment..... **.69**

500 Men's Heavy Khaki Duck Mining Shirts, collars, pockets, have patent fasteners, large roomy shirts, wind and rain proof. Sizes, 14 to 17½. Special ..... **.89**

Men's English Cardigan Jackets and Golf Coats, three pockets, guaranteed all worsted, fast color. Sizes, small, medium and large. Regular value $4.00 and $5.00. Each **$2.98**

Men's Heavy Elastic Web Suspenders, strongly sewn, made with unbreakable cast off leather ends, Police-Firemen style. Our price 50c. Each ..... **.39**

Men's Heavy Tweed Shirts with collar and pocket, generously made, double stitched throughout, also a few heavy Mackinaws and black Drills in the lot. Sizes 14 to 18. Regular value, $1.25, $1.50, $1.75, $2 00. Each.. **.89**

Announcement

THE publishers of THE CANADIAN MINING JOURNAL are presently to issue a Souvenir Handbook commemorating the recent visit of the American Institute of Mining Engineers to Ontario. This Handbook will be in every way a complete and appropriate memento of an important event. The cover has been specially designed. The text will embody a synopsis of the proceedings and expressed opinions of the eminent visitors, and historical and descriptive sketches of the mining districts visited. Many half-tones and maps will embellish the reading matter.

The Handbook will appear during September. As the edition will be limited, orders should be placed at once. The price is One Dollar.

THE CANADIAN MINING JOURNAL

VOL. I. No. 14 New Series | TORONTO and MONTREAL | Old Series, Volume xxviii. No. 16

The Ontario Companies Act

provides that the purchaser of stock in mining companies be supplied with a prospectus giving specific information on these points:—

(1) The names and addresses of the vendors of the property purchased or acquired by the company.

(2) The amount paid or payable as purchase money in cash, shares or debentures of any such property, specifying the amount payable for good-will.

(3) The amount paid or payable as commissions.

(4) The amount of preliminary expenses.

(5) The amount paid or intended to be paid in cash, shares, or debentures to any promoter, and the consideration for any such payment.

(6) The dates of and parties to every material contract, and the place where such contract may be inspected.

(7) Full particulars of the nature and extent of the interest of every director, with a statement of all sums paid or agreed to be paid to him in cash or shares by any person either to qualify him as a director or otherwise for services rendered by him.

The Act further provides for the imposition of a penalty of $200 for each violation of the Act, and state that *where the prospectus contains any mis-statement of fact every director is personally liable for the full amount of moneys paid by shareholders, together with interest on the same and damages.*

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79 334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons The Gold Production in 1906 was $5,579,039 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

Westinghouse Motor Quality

CAN BE DEPENDED UPON IN ANY CLASS OF SERVICE.

We illustrate a Westinghouse Motor operating an Ottumwa Box Car Loader.

This service calls for—

A motor of exceptional electrical characteristics.

A motor of extremely strong construction.

A motor simple and easy to operate.

All these qualities and others are embodied in Westinghouse Motors.

Merralls Milling Machinery

"The noblest Roman of them all."

Merrall's Improved Roll Rock Breaker

Strongly built and durable, with chrome steel jaw and roller shell. Crushes every class of ore from the hardest to the softest. Never packs or clogs. Crushes fast and fine (to eight mesh). Clears itself every stroke. Exceptionally light running.

Send for Catalogues fully describing our radical improvements in Breakers, Stamp and Roller Mills.

Manufactured at Ottawa, Canada.

THE REASON WHY

Amatite ROOFING Needs No Paint—

The enlarged diagram above tells the story.

If you examine it you will notice that it is composed of five different layers.

In fact, Amatite is made on a different principle from any other roofing. Instead of a smooth skin coating *made to receive a coat of paint*, Amatite has a rough surface of small particles of hard silicious rock such as seen in quartz or other hard stone when examined under a microscope.

This mineral surface is chosen for its weather-resisting qualities, and does away *absolutely* with *painting* and *coating*.

Underneath the mineral surface are alternate layers of long-fibre, woolstock felt of the best grade, and between each sheet and under the mineral surface on the top is a layer of a specially prepared Coal Tar Pitch, *the greatest waterproofing material known*.

This short description will give you some idea of how carefully Amatite is constructed and what effective protection it will give against weather of all kinds.

Leading Features of a Good Rock Drill

No. 3.—Patented Adjustable Shell

The Patented Adjustable Shell of the "RAND" Drill is a valuable feature, and is the only practical adjustable shell on the market. By removing one or more of the thin sheet-iron shims and tightening the slide bolts again both top and side wear is taken up. The shims are held by dowels, so that they cannot wear out. On the smaller drills the shells are made of malleable iron, but on the large drills where the shells are subject to greater strains they are made of the highest grade of open-hearth steel castings.

This arrangement of guides assures the maximum of bearing surface whatever the position of the drill. Adjustment is secured by taking-out liners, therefore no extra stock is needed.

MEN AND METHODS

On page 15 of the *Toronto World* of September 14th, 1907, there appears a short article entitled "Larder Lake Investors Making Money—Larder Lake Gold District Proving the Greatest in the World." It begins by stating that eminent engineers from England, Germany and France have recently made "searching examinations of the Larder Lake gold fields," and that, one and all, they have endorsed the reports of United States and Canadian experts in terming Larder Lake the mining wonder of the world.

The next paragraph implies that "English, German and French engineers," familiar with the great gold deposits of South Africa, Australia and Siberia and the world generally, state that the Larder Lake district outclasses them all.

"One of the most prominent engineers of London," just back from a six weeks' examination of the district, is quoted as stating that South Africa never offered as inviting a field as does Larder Lake.

The fourth paragraph, however, brings us to the significant feature of the article. In vague terms a "report" is repeated, that London engineers have gone to examine the Blue Bell and Lucky Boys' mines, that well-known mining interests of England and France are to become "strongly identified therein," and that a great smelting plant is to be erected. "The price at which these interests" (we quote the *World's* phrases here unchanged) "will become interested is reported to be considerably above par and is not from private holding, but from the treasury stock of the companies." Reference is then made to the fact that Law & Company, brokers, of Toronto, during the past six months placed the shares of the Lucky Boys and Blue Bell mines on the market at 6 and 10 cents respectively. The development of many veins "running in width from 4 feet to 140 feet" is mentioned, and the value of the ore in sight and available for the two companies is estimated at more than thirty millions of dollars.

The "outcome" of all this is taken as vindicating the judgment of the brokers mentioned above. The article concludes with the statement that engineers and miners who have examined and are familiar with the properties claim the shares of Blue Bell and Lucky Boys will be worth ten dollars per share within the next year.

Incidentally we shall make a point of remembering that last prediction. If, within a year, shares in Blue Bell and Lucky Boys reach the ten dollar mark, we shall gladly retract all that we intend to say.

There are certain pointed comments called for by this article. In the first place, there are no indications, beyond internal evidence, that it is an advertisement.

Therefore we take it that the *Toronto World* is responsible for its appearance.

Secondly, statements to the effect that Larder Lake gold district is proving the greatest in the world are totally unjustifiable. They are false and they are harmful alike to Larder Lake and to investors. Larder Lake is not "proving the greatest in the world."

Larder Lake is yet and will be for many months a new and unproved camp. The newspaper reports circulated about it have done it vastly more harm than good. Among those competent to express an opinion the district is looked upon as a low grade "proposition" with a possible future before it. The most sanguine of the reputable mining men who have visited the camp do not go farther than expressing their belief that when Larder Lake shakes herself free of wild-cats she will settle down into a steady low grade gold camp.

Therefore nothing could be more fatuously silly than comparing Larder Lake with the established gold camps of Australia and South Africa.

We invite the *Toronto World* or the person or persons who are responsible for the article to give us (in confidence if necessary) the names of the eminent English, German and French engineers who entertain such glowing opinions of Larder. Meanwhile we shall frankly say that we do not believe that any English, French, German, American or Canadian mining engineer of good standing would make any such statements for publication. We are similarly incredulous of the reported statement of "London Engineer," in the third paragraph.

The report that strong English and French interests are to buy stock in the two mines, floated by Law & Company, at considerably above par value, is not given as merely a rumour. It is so placed that the unwary reader will be led to conclude that the deal is about to be consummated. It will therefore require our attention for a moment.

It is very unusual, to put it mildly, for mining engineers commissioned by "well-known mining interests" to advertise their intentions or to allow them to be advertised. The *Toronto World*, after saying that "engineers have gone to examine" the mines in question, implies that, as a foregone conclusion, their report is to be favorable and that English and French capital will be at once injected into the concern. Now this is not only unlikely, but so extremely improbable as to warrant us in calling it fantastic. What decent mining engineers would allow their employers or any one else to take their opinions for granted? If examinations are to be made on these mines by clean engineers, then neither the *Toronto World* nor THE CANADIAN MINING JOURNAL can have any legitimate means of knowing what their dictum is to be. As it stands then, this portion of the paragraph is unworthy of credence. It follows logically that the statements based upon this rumour, concerning the acquisition of the stock, fall into the same category. It also follows that, contrary to the *Toronto World's* opinion, the whole business reflects no credit upon Law & Company, brokers, of Toronto, Ontario.

The *Toronto World* is oftentimes the outspoken and fearless champion of right. The publication in its columns of trashy mining advertisements and of inspired mining news can add nothing to the paper's reputation. This applies, in varying degrees, to almost every newspaper in Toronto. We wish for the benefit of the Toronto papers, to direct their attention to the principal British Columbia dailies. Their Western contemporaries publish well-authenticated correspondence in mining matters. Their columns are clean and reliable to a very commendable extent.

THE PASSING OF THE SCOTT ACT

(Contributed)

In the County of Cape Breton at the present moment the average man "dunno where 'e are" in the matter of liquor laws, and in Glace Bay at least there is "no King in Israel." The fourteenth was pay day, and at night the streets of the town were full of "drunks." The local paper states that the sounds of revelry and blasphemy continued till three in the morning of Sunday. It was presumed that Saturday was the last day of the Scott Act, but the lawyers are not yet quite sure whether the Scott Act is in existence or not, as its repeal has not been gazetted. Samuel Weller said the law was a "hass." He was right. We imagine that the smaller fry amongst the legal fraternity will deplore the passing of the Scott Act into the limbo of things that have been, for it was the cause of much profitable litigation. Peace to its ashes, and may it never be resurrected until our councillors are men of more wisdom than those who represent us to-day. It is stated that under the Provincial License Law no license application can be entertained until December, and no license can be granted until March, 1908, and that further, any person convicted of selling liquor forfeits his right to apply for a license for the space of four years. Hence we are told that for six months we shall get real prohibition. Shall we? The Scott Act was not carried out, and the Nova Scotia License Act will not be carried out. So long as liquor is manufactured in Halifax and Upper Canada it will be drunk in Cape Breton, and the tighter the bands of prohibition are drawn the viler will be the stuff dispensed, and the more flagrant will be the evils of secret drinking in the unmentionable dives that such sumptuary laws encourage. The Mayor of Sydney in a recent speech said "one might as well try to enforce the Ten Commandments, as try to enforce prohibition." Such a remark is not orthodox and its morality is doubtful, but alas, men in general are neither orthodox nor moral, indeed we have it on good authority that men are "deceitful and desperately wicked." The utterly impossible and hopeless attitude of the extreme temperance party on this subject is well illustrated by a remark that was made to the

writer when discussing this matter with a gentleman who is fairly representative of his class. This gentleman said: "If I thought that the granting of a restricted number of licenses in Sydney would cut down the drinking by fifty per cent. I would not append my name to an application, simply because I object to the principle." We had thought it was the drinking these gentlemen objected to.

We again submit that the only cure for the drink evil lies in a gradual education of public opinion along temperance lines, and the provision of suitable and cheerful places where light beers and refreshments are dispensed and where men can read and indulge in various games of skill and recreation. Good work has been done along these lines under the auspices of our Governor-General, Earl Grey, in the large cities of England. Workingmen, and particularly miners, must have occasional amusement and relaxation, and if it is not provided for them elsewhere they will find it in the saloon. Temperance bodies may debate, legislatures may legislate, and preachers may fulminate until the crack of doom, but nevertheless, the workingman will have his beer, willy nilly. Then why not appreciate this fact, and give it to him of good quality and openly, and amid congenial surroundings. For when all is said and done have it he will.

REWARDING PROSPECTORS

An excellent point is made by a correspondent in this number of The Canadian Mining Journal. He brings forward the suggestion that prospectors should be rewarded by the State. Not only should the successful prospector share in the beneficial results of his ardour and perseverance; but the unsuccessful should receive some recognition. Not always are the prospectors who make the biggest stake the men who have done most for the opening up of the country. It is not unusual to find the boldest and sturdiest pioneers quite dependent upon small tradesmen for their grubstake. If, in process of time they make no remunerative discoveries, this precarious means of support is cut off and the knights of the wilderness find themselves stranded on the high and dry shore of destitution.

Assuredly no better use could be found for a moiety of the wealth that the country derives from her mineral deposits than that of providing for the old age of prospectors.

STEEL VERSUS COAL

Judge Longley's decision in favor of the Dominion Steel Company was in some respects a surprise. While it was apparent to those who carefully watched the progress of the suit that the Dominion Steel Company would get at least a favorable decision, it was hardly expected that every contention put forward by the Dominion Coal Company would be brushed aside. In the interests of lasting peace it is probable that a less sweeping decision would have been better. If the Dominion Coal Company needed any incentive to continue the fight, that incentive has been given it now. Apparently an appeal on the part of the Coal Company is certain.

When one considers that an English expert was retained by the Dominion Steel Company to give evidence, that he was paid at the rate of $250 per day outside of his expenses, and when one further reflects that this is but a small item in the total expenditure of one of the litigants, the conclusion obtrudes itself that neither company has the moral right to waste its substance in such riotous foolishness.

A summary of the principal points of Judge Langley's decision will be found on another page.

MINE TAXATION

Arizona is enforcing a mines taxation law, the provisions of which will probably surprise Canadian mine owners. The basis for evaluation of mining property is taken as 25 per cent. of the gross metal output of productive patented and unpatented mines, and $20 per acre for non-producing mining claims. Under this system of assessment the larger mining companies have a well-proportioned share of the tax. The relatively heaviest tax, however, falls upon non-producing mining claims. We note, in passing, that owners of the latter class of claims have done most of the growling.

RESULTS

The Big Ben Cobalt Mines, Limited, has suspended operations. It is to be hoped that the directorate of that company will seize the opportunity of putting themselves in a more favorable light. Had our recent criticisms been unjust we would doubtless have heard from some of the officials. From their silence we draw the conclusion that they cannot gainsay the facts adduced. Hence we fully expect to hear of a thorough re-organization of the company or of the refunding of the moneys sent in by purchasers of the stock. It is hardly necessary yet to remind investors that they can easily recover their subscriptions by availing themselves of the Ontario Companies' Act.

Editorial Notes

A German correspondent enquires for Canadian shippers of agate. Quotations on any quantities that can be supplied at market figures c.i.f. Hamburg, Marseilles and Trieste. The Canadian Mining Journal will gladly give further information to any one interested.

Canada's pre-eminence over the United States in the production of mica is encouraging. Statistics given on another page demonstrate that Canadian exports of mica exceed the total production of the United States by over 100 per cent. The regularity and extent of Canadian mica deposits, and the high grade of the mineral found, should be ample guarantees that the relative positions of these two countries will be maintained.

A LARDER LAKE WILD CAT

We have before us what purports to be the prospectus of "The Blue Bell Gold Mines, Limited," issued by Law & Company, stock brokers, Traders Bank Building, Toronto, Ontario.

In this document there are four pages. The first page begins with a caption in heavy letters, "Larder Lake the New Eldorado of Northern Ontario." Next comes the column title, "The Golden North and the Golden Opportunity." This is succeeded by almost two columns of lyrical prose, interstrewn with exclamation marks, capitals and other typographical devices. As a specimen of English literature it is wonderfully tawdry; as a sample of the brokers' art it is a nauseating reiteration of exaggerations and falsehoods.

Here we have brokers, making high claims to respectability and reliability, offering to the public something for which they wish the public's money in return—in itself a strictly commercial transaction. Instead of telling their prospective customers exactly what they wish to sell them, they engage a printer to put together a collection of adjectives and punctuation marks! After the manner of the patent medicine vendor, this is good work; but as a presentation of facts and figures about a gold mine, it is balderdash.

The phantasm of "ground floor" prices is held out. The imagination and the sentimentality of the reader are appealed to. "Why," the prospectus asks, "should the thousands of strong men who braved the north winds last winter around Larder Lake, etc., etc., etc., have done so unless they knew full well the treasures they were guarding?"

Let us, following Master Socrates, answer this question with another. "Why," we query, "should Law & Company, stock brockers of Toronto, Ontario, devote so much space to claptrap if they have so fabulously rich a mine?" We are persuaded that not ourselves, and very much less Law & Company, would allow the public in on one share of a mine whose ore assayed as high as $15,000 to the ton from "the very grass roots."

In this we may misjudge our friends Law & Company, stock brokers of Toronto. They may be (who knows!) a new type of self-effacing Christians. But in that case we shall consider it our sacred duty to protect them from themselves.

Out of several hundred color effects in words these facts emerge from the first section of the prospectus. Law & Company invite the public to join them and participate in the profits and benefits "that are sure to come to all" who invest in Blue Bell Gold Mines, Limited. The company owns "28 well-selected gold claims." Assays showing $15,000 to the ton have been obtained. The men identified with the project are all that could be desired.

As pointed out in a previous issue, such an assay may mean anything or nothing. In Larder Lake it is certain that no large body of ore carrying anything like a fraction of this amount to the ton has yet been discovered. The directors, if respectable mining men they are, have had very little to do with this prospectus.

Page 1 concludes with an extract from the *Toronto World,* April 4th, 1907. The second page also is largely given up to quotations from the *Toronto World* and the "Ontario Mining News." In connection with this free use of extravagant mining news we wish to make some remarks. Enquiry at the *World* office failed to elicit information as to whether such items were paid for as advertisements, were directly inspired by promoters, or were evolved by the paper's reporters. On these points the reader can easily draw his own conclusion—and there is but one conclusion to draw. Here, too, we may insert a warning against two mining brokers' sheets. One for some time known as the *Ontario Mining News,* has recently changed its name to the *Canadian Mining News.* The other appears under the appellation of the *Mining Digest.*

Page 3 presents a map of Larder Lake, on which the 28 forty-acre gold claims of the Blue Bell Company are shown in black. An excerpt from the *Ontario Mining News* contains the usual amount of hyperbole and one gem of phraseology. Quartz is referred to as "these quartz." We mention this trivial circumstance because such things have a deeper significance than is generally known.

Half of page 3 is devoted to three reasons why Blue Bell is a good investment. These reasons are sheer twaddle. What does a business man care about the opinions of old miners about Larder Lake's future?

Why should the fact that thousands of brave men have been frost-bitten in their passionate longing to give Law & Company advertising material, influence the investor?

And, again, more emphatically we protest that directors are not gold mines!

Page 4, except that it is called a "Proclamation," is merely a re-hash of the previous pages. A blank application form appears at the bottom of the page. It is made out to the Trusts & Guarantee Company, Limited, 14 King street west, Toronto.

Not once throughout this prospectus is the capitalization of the company mentioned—an omission which is a most barefaced breach of the requirements of the Ontario Companies' Act. We cannot look upon this as merely an oversight. It is evidently an intentional gap and, just as evidently, Law & Company do not care to give facts and figures. Otherwise why should they offer such a production as this in lieu of the statements demanded by the statutes of the Province?

We shall, in conclusion, enumerate a few of the facts gathered from records in the Provincial Secretary's office. The company was incorporated on April 7th, 1907. Its capitalization is $5,000,000, divided into 5,000,000 shares of $1 each. Its board of directors comprise the followings names:—

President—J. H. Hunter, Cobalt, Ont., capitalist.

Vice-President—D. T. Hughes, Buffalo, N.Y., hotel proprietor.

Secretary-Treasurer—W. A. Abentroth, Toronto, Ont., accountant.

John S. Crawford, Ottawa, Ont., manufacturer.

W. R. Graham, Cobalt, Ont., architect.

The mining claims owned by the company were purchased from William L. Russell for the consideration of 3,000,000 shares of the company's stock. The directors are authorized to pay brokers a commission of 25 per cent. of the stock sold by them. These facts speak volumes for themselves and for the subscriber's chances of getting a run for his money.

Mr. H. Mortimer-Lamb, Secretary of the Canadian Mining Institute, has completed a tour of British Columbia, during which he was successful in adding a considerable number of members to the Institute.

Smelting Works of the Consolidated Mining and Smelting Company of Canada, Limited, at Trail, B.C.

J. M. Turnbull.

The smelter of the above named company is located at Trail, British Columbia, on the edge of a flat bench which rises about 200 feet directly above the Columbia River at the junction of Trail Creek.

The smelter began as a small plant producing copper matte from Rossland ores. It was built by F. Augustus Heinze, and was first blown in during February, 1896.

The Canadian Pacific Railway Company acquired it from Heinze in 1898 and greatly enlarged and extended it, lead blast furnaces and refinery being among the additions.

TRAIL SMELTER—FROM ACROSS TRAIL CREEK.

The Consolidated Company purchased it on January 1st, 1906, and have made extensive additions also, including the installation of the Huntington Heberlein process for lead ores, a large addition to the lead refinery, a new copper furnace, enlargement of old copper furnaces and a new sampling mill capable of handling 200 tons per hour.

The total expenditure on plant and equipment to date runs to about $1,250,000.

The Canadian Pacific Railway Company has some three miles of sidings on the smelter flat, and connects the works with Rossland and the other mining camps of British Columbia.

The main features of the equipment consist of the following:—

One 100 ton Fairbanks railway scales.

Five copper blast furnaces. Three of these are 263 x 42 inches at the tuyeres; the others are smaller but will be enlarged to the same size this year. Each of these is capable of handling about 300 tons of Rossland refractory ore per day.

Two lead blast furnaces, 45 inches by 140 inches and 45 inches by 160 inches respectively, at the tuyeres, each capable of handling 125 to 150 tons per day, according to the ores treated.

An extensive system of flues is installed connecting the furnaces with two brick stacks, the highest being 185 feet high.

Two O'Hara roasters, 9 by 95 feet and 12 by 97 feet respectively.

Four Huntington Heberlein circular roasting furnaces, 26 feet in diameter, and twenty-four Huntington Heberlein convertors have replaced the ten hand roasting furnaces formerly in use.

Blowing plant consists of three No. 7, one No. 7 1-2, one No. 8 Connersville blowers; one No. 8, one No. 9, one No. 9 1-2 Root blowers. Each is connected to a separate electric motor, the total power used being some 1,100 horse-power.

Briquetting plant contains two Chisholm, Boyd & White briquette presses, and necessary pugmills, etc.

Old sampling mill for copper ores is equipped with No. 6 Gates crusher, elevator, and series of Vezin samplers and small crushers. Its capacity is 80 tons of ore per hour.

New sampling mill is equipped with No. 8 Gates crusher and Vezin samplers. The capacity is 150 tons per hour, enabling all sampling to be done on one shift, with much resultant economy. Among other improvements in this mill the use of manganese steel is expected to result in a saving in repairs and consequently a saving in time.

The sampling mill for lead and high grade ores has a capacity of 30 tons per hour and is equipped with Blake crushers and Brunton samplers.

made up here and weighed in specially designed side dump cars, which are run to the furnaces by a locomotive, the former system of handling by hand being nearly superseded.

The assay office is a large brick building, and is very completely equipped. It was built in 1902 and is modern in all respects. An electric motor drives the crushers and grinders. Electric heaters are used in the moisture sample dryers and in the chemical laboratories. Four large muffle furnaces are installed and the chemical and other equipment is very complete. A large range of work is done here, including assays and analyses of all kinds of ores, smelter products, coal and coke, and products from the lead refinery.

TRAIL SMELTER REFINERY.

Six Bruckner roasters were installed some years ago, but are not much used at present, not being suitable for use with the products now being turned out in the works.

The haulage system is quite extensive. A large generator with motor is installed in the blower room, and four three ton electric trolley locomotives are used, operating on three levels. The top level runs over the storage yards and distributes ore over the storage yards, which have a capacity of about 40,000 tons of ore. The second level is the main haulage level. It connects with the sampling mills and with a tunnel below the storage yards. Ore, coke, limestone are handled from the yards and sampling mills to the charging bins. The third level is on the charging floor. The charges are

The lead refinery deserves a longer description than can be here given. The equipment consists of three motors totalling 650 kw. and corresponding generators, which supply current at about 80 volts and 3,500 amperes for the electrolyzing tanks. One 50 ton melting pot and anode casting machine, 224 tanks, made of wood and lined with asphalt, each holding 20 anodes. The anodes weigh about 350 pounds apiece. The tank and melting room is 311 by 50 feet, and an electric travelling crane runs the length and handles all materials. Two 50 ton melting pots with pump and casting moulds dispose of the refined lead, which is loaded directly into cars at the door. A patent machine is used for turning out thin cathode starting sheets. The slime plant consists of drying tanks, small reverberatory melting fur-

nace, parting kettles for parting the dore silver bars, tanks for precipitating the silver on copper plates, and an evaporating plant for evaporating the resultant copper solution. A lead pipe machine is part of the equipment, making pipe from 1-8 to 4 inches in diameter, of any length required.

The hydro-fluo-silicic acid required is made in the acid plant, which consists of two distilling furnaces and condensing tower with storage bins for fluor spar and silica.

Handling of material between the furnaces and the refinery, about one-quarter of a mile apart, is done by the yard engine on the tracks of the Canadian Pacific Railway.

The general equipment includes a great amount of smaller plant not mentioned specifically. Complete blacksmith, boiler, machine and carpenter shops attend to construction and repairs, and there are a large number of buildings, including general offices, warehouse and a number of fine residences on the bank of the Columbia River above the smelter.

An ample water supply is obtained from a five mile line of 14 inch and 16 inch wood pipe connecting with three different creeks. It reaches the smelter through two steel penstocks at a head of about 100 feet.

The fire protection system includes a 700 gallon Worthington centrifugal pump, with hydrants and hose reels at convenient points.

Coke and coal are obtained from the Crow's Nest Pass Coal Company's ovens and mines at Fernie and Michel, B.C., some 244 miles east of Trail. The quality is good, though rather high in ash.

Lime rock comes from the company's own quarry at Fife, B.C., on the Canadian Pacific Railway line. The rock assays about 50 per cent. lime or calcium oxide. Up to 200 tons per day is used.

As regards ore supply the smelter is in a very strong position. The Consolidated Company own the Centre Star Mines in Rossland, capable of producing 500 tons of gold copper ore per day. This is the chief single supply of ore. The company own the St. Eugene mine, the largest lead-silver ore producer in British Columbia, which is capable of producing 100 tons per day of high grade lead ore and concentrates. The company also have a lease on the Snowshoe mine at Phoenix, which ships 200 to 300 tons per day to the smelter and is easily capable of turning out two or three times this tonnage if pressed. It is worthy of note that the smelter is treating this ore from Phoenix, in spite of the long haul to Trail directly past the Granby smelter, of whose low smelting costs so much has been heard.

TRAIL SMELTER—FROM ACROSS COLUMBIA RIVER.

A large tonnage of custom ore is also handled. Copper and dry ores are received from the Boundary, Kamloops, East Kootenay, Lardeau, Slocan, Nelson, Ymir and other districts of British Columbia, and occasionally from the United States. Lead ores come chiefly from East Kootenay, Slocan and Lardeau districts.

The great diversity in composition of the ores received renders it possible to smelt without the admixture of

any barren fluxes except limerock. Lead bullion from other smelters and mill products are also handled.

The ore buyer is a technically trained mining engineer, and the securing of ore supplies well in advance of needs is one of the most important branches of the work, demanding not only a careful consideration of the metallurgical requirements, but a wide familiarity with the mining districts and most of the mines.

Treatment rates vary considerably with the nature of the ore and the distance of transportation, since the latter is included in the rates given. The freight and treatment rates on Rossland gold copper ore, for instance, has been reduced from $11 per ton in 1896 to $3.25 per ton at the present date. Dry ores receive rates varying from $8 to $12, and heavy lead ores an average rate of about $12, depending on the lead content. Concerning methods of treatment:—All shipments are carefully weighed-in on the railway scales, and are then put through the appropriate sampling mill, the resultant pulp and moisture samples going to the assay office. The mines representatives are enabled to inspect the whole process and obtain portions of the pulp and moisture samples for their own assay.

An extra pulp is kept under seal for umpire assay in case of dispute.

Formerly the Rossland and some other gold copper ores were first roasted in heaps to drive off excess sulphur, but of late years the amount of sulphur in the charges has been less and the custom is to feed the ore raw to the furnaces. The products of the furnaces consist of slag, which is granulated and carried away by streams of water, very conveniently and cheaply, and a matte which runs 10 per cent. to 15 per cent. copper. This matte is granulated by pouring into a stream of water, and the granulated product is treated in the O'Hara roasters and the roasted matte is briquetted in the briquette plant. As an alternative the granulated matte may be treated in the Huntington Heberlein convertors, the resultant mass simply being broken up and not requiring briquetting. In either case the roasted matte is re-smelted with certain selected ores and a high grade matte running 45 per cent. to 50 per cent. copper is produced. This product is shipped to the United States for treatment, as the Trail smelter does not yet possess copper convertors for the production of blister copper. The slag from this smelting is largely returned to the low grade furnaces for re-treatment.

The flue dust from the furnaces is collected periodically and briquetted, and the briquettes are returned to the furnace with succeeding charges.

Briquetting is done by mixing the flue dust or granulated matte with 5 per cent. of lime, and the moistened material is mixed in pugmills and pressed in the briquette presses. The necessary lime is burned in two small kilns on the premises, the limestone coming from the company's own quarry.

Lead ores, which are mostly in sulphide form, are crushed and mixed with a certain proportion of crushed lime rock. The mixture is bedded in the yards, a variety of ores being bedded together, so as to get a correct smelting mixture. This mixture is roasted at a low heat for eight hours in the Huntington Heberlein roasting furnaces. The resultant sinter is somewhat cooled and then fed gradually into the convertors on top of a small wood fire, air is then blown in and the mass begins to glow, and more sinter is fed in until the convertor is full of a glowing mass in about 8 hours. The mass is allowed to cool and is then dumped out and broken up. The product is fed to the blast furnace, with certain other high grade ores and products and the requisite amount of coke. The product from the blast furnace is lead bullion. This is cast into bars and sampled by punching and shipped up to the refinery. In the refinery the lead bullion is cast into anodes, which are placed in the tanks alternately with thin starting sheets of refined lead. The electrolyte contains lead fluo-silicate and other chemicals in solution. The electric current used is rated at 3,500 amperes at 80 volts. At the end of 8 days the lead has passed over on to the cathodes, which are taken out, washed, melted and cast into shipping bars. These bars run over 99.98 per cent. pure lead. The precious metals and impurities of the anodes remain as a black slime in the tanks. This is taken to the slimes plant, where it is washed, the washings being evaporated down to recover the electrolyte contained. The washed slime is dried and melted in a small reverberatory furnace, connecting with a system of flues, the dust from which is periodically collected and sent to the smelter for treatment. The product is a dore silver running about 950 fine. This is parted in sulphuric acid, the remaining gold is melted and cast and runs about 995 fine. The silver solution is run into tanks, heated by steam, where the silver precipitates on copper plates, the copper going into solution. The silver is melted and cast into bars weighing about 80 pounds. It runs about 999 fine.

TRAIL SMELTER FURNACE BUILDING.

The copper sulphate solution is run over to an evaporating plant, which it is crystallized out, re-dissolved, recrystallized out and put up in barrels.

Mr. A. J. McNab, metallurgist at the smelter, has worked out a process for recovering the 30 per cent. or so of antimony which the slimes contain, so that antimony will become one of the regular products of the works in the near future.

To recapitulate, the products of the works are:—Copper matte, carrying 50 per cent. copper and the bulk of the gold produced; fine gold, fine silver, refined lead, lead pipe, copper sulphate, and, in the near future, antimony.

The copper matte is sold to the United States smelters. The fine gold and silver to the United States mints at Seattle; fine silver also goes to the far east, etc. Lead is largely sold in Canada, the balance going to the far east or London. Analyses made by the Japanese Technical Department at Osaka, and published in the *Engineering and Mining Journal* of June 22nd, 1907, show that the Trail lead compares favorably with other well-

known brands, and is in fact probably the purest in the world. Copper sulphate is used by the farmers on the prairies to kill the smut in wheat.

The total number of employes averages about 500, a considerable number foreigners of several European nationalities. No Japs, Chinese nor Hindus are employed.

The power used in running the works is entirely electric, coming from Bonnington Falls at 20,000 volts; it is stepped-down by a battery of transformers to 550 volts for use in the works. The total power consumed runs from 2,500 to 3,000 horse-power.

The production of the works from the beginning to June 30th, 1907, has been 1,322,573 tons of a gross value of $28,786,146. At present production is at the rate of about $5,000,000 per year. With an adequate coke supply assured, this would become between $6,000,000 and $7,000,000 per year.

The refinery produces up to 75 tons refined lead per day, and about 1,800,000 ounces fine silver and 15,000 ounces fine gold per year. Most of the gold, however, and all the copper, which constitute the remainder of the valuable metallic shipments, are shipped in the form of high grade copper matte.

The quantity and variety of custom ores received, together with the assured supply from the company's own mines and the variety of products produced, on account of which the values produced are not dependent on the fluctuations in price of any one metal, place the smelter in a very strong position with an assured future.

The Consolidated Mining & Smelting Company are paying 10 per cent. annually on their capital stock, and have paid a total in dividends of $714,945 since the amalgamation of the company, January 1st, 1906.

The officers of the company are:—W. D. Matthews, Toronto, president; W. H. Aldridge, Trail, managing director; Jules Labarthe, Trail, manager of Trail smelter and refinery, and R. H. Stewart, Rossland, manager of mines.

MICA IN 1906

(Condensed from a Bulletin of the U. S. Geological Survey.)

Of the mica minerals only two are commercially valuable. These are muscovite, or potash mica, and phlogopite, or magnesia mica. Mica depends for its value upon its cleavage and the toughness, flexibility and elasticity of its cleavage sheets. The properties, combined with transparency and non-conductivity of electricity, render the varieties mentioned valuable in the industrial world.

Commercially mica is formed in rough blocks, sometimes with crystal outlines; thus crystals are often called books. In color mica is somewhat variable and generally muscovite is much lighter than phlogopite. Muscovite may be white, gray, yellow inclining to amber, brown, red and green. Phlogopite is generally some shade of yellow or brown to black, often possessing a coppery appearance, and is called "amber" mica from its color. Other colors observed in phlogopite are milky or silvery gray. The luster of muscovite is brilliant and glimmering on fresh surfaces, while that of phlogopite is less brilliant and more silvery or pearly.

Muscovite often contains inclusions of other minerals, either between the laminae or cutting across them. Common inclusions are magnetite, quartz, feldspar, garnet, and other mica crystals, with tourmaline, apatite, beryl, and rare minerals of less common occurrence. Inclusions of magnetite are in the form of minute crystals, often arranged in definite positions with respect to one another. Intergrowths of biotite possessing the same cleavage as the inclosing muscovite may occur. The various inclusions detract from the commercial value of the mica.

Occurrence.—Of the two valuable varieties of mica only one, muscovite, is found in deposits of commercial value in the United States. Commercially valuable muscovite is confined to pegmatite. As a coarse product of crystallization of pegmatite, mica is sometimes found in blocks more than a yard in diameter.

Mica crystals occupy various positions in pegmatite masses. Where the pegmatite has a typical granite texture the mica may be found evenly distributed through it. Often the large crystals will be found either in clusters at intervals through the "vein," in places partly connected by streaks of small crystals, or along one or both walls of the pegmatite. When there is a quartz streak within the pegmatite the mica occurs on either or both sides of it, being in places partly embedded in the quartz or occupying any of the positions noted above in the remaining portion of the pegmatite. The common forms of occurrence of pegmatite, commercially valuable for mica, are over-lapping lenticular-shaped bodies and sheets of more persistent extent. The minimum limit of thickness for a workable pegmatite body may be arbitrarily placed at from 1 to 2 feet for rich and regular bodies.

Outside of the United States, mica of commercial size has been found in India, China, Japan, Mexico, Brazil, Argentine, German East Africa, Australia, and other countries.

Mining Methods.—Where mica deposits are regular in content, direction, and extent, they may be, in Canada, all systematically mined. Irregular deposits do not lend themselves to such methods of approach.

In Canada there seems to be a stronger tendency for systematic mica mining than in the United States, especially in the phlogopite deposits in pyroxenic rocks, which are probably more regular in nature than most muscovite deposits in pegmatite. In India the deposits are more irregularly worked than in any other region, since nearly everything is done by hand, even to removing mica and waste from the mines.

Production.—In the United States the production of sheet mica for 1906 amounted to 1,423,100 pounds, valued at $252,248. The total production of scrap mica was 1,489 short tons, valued at $22,742. Canada in 1906 exported 913 short tons, valued at $581,919.

Prices.—For sheet mica the price per pound ranges from 13 cents for uncut mica, 1 1-2 inches by 2 inches, to $2.50 per pound for uncut sheets 6 inches by 8 inches. Sheets of manufactured selected mica run from 60 cents per pound for sizes 1 1-2 inches by 3 inches, to $6.75 for sizes 6 inches by 8 inches. Scrap mica sells for from $8 to $30 per short ton.

The executors of Andrew Marks Wiley are suing for $150,000 commission before Master-in-Chambers at Osgoode Hall for the sale of the Anthony Blum Mine, Wabigoon, Ont., to Hugo Von Hazen, New York, for $8,000,000. It is alleged that $10,000 was paid on account, and that the Laurentian Mines Company then took over the property and that Mr. Blum was given stock in it instead of cash. The vendor claiming that the transaction was altered, refused to pay the commission to Wiley.

STAMP MILL RECORDS

E. Percy Brown.

I have frequently felt the need of some simple method of tabulating mill data, particularly in the case of a small mill treating the ore from the development of a new property, where it is most essential to be able to follow every step in the treatment of the ore.

This can only be done by careful tabulation of the results of different methods of treatment, and in this way the method best suited to the ore can be accurately determined.

Although this form was primarily designed to meet such a case, yet I believe that a great deal of most valuable information would be derived from a similar tabulation of results where large mills are working on well-established propositions.

(TABLE No 1)

MILL RUN No.—

ORE FROM —— WEEK COMMENCING ——

DATE	SHIFT	ORE HOISTED	HOURS MILL RUN	CAUSE OF STOPS	MERC USED	MERC RECOV	NETT MERC USED	AMALG RECOV	ASSAY OF TAILINGS	REMARKS
TOTAL										
BAT FORWARD										
GRAND TOTAL										

I know that in some cases this is done; but it is a well-known fact that in most cases only a very crude attempt is made to record such data. The tables as given are intended for use on a free-milling gold ore, the battery tailings being concentrated and the concentrates saved for further treatment.

The writer believes that the points most necessary to watch on such a proposition are:—

(a) The feeding of mercury.

(b) The ratio of the gold saved inside the battery to the total free gold in the ore.

(c) The loss of mercury per ton of ore.

(d) The assay of the mill tailings.

These are to be carefully noted and compared, as the crushing capacity of the mill is increased or decreased by changing one or more of the four factors:—

(a) Number of drops per minute.

(b) Height of drop.

(c) Height of discharge.

(d) Size of opening in screen (i.e., mesh).

Any mill man will readily understand the importance of these things, and how essential it is that the relation of cause and effect should be carefully studied.

Table number 1 is intended to be used as a daily record, there being one sheet for each week. The totals are to be carried forward from one week to the next, and the final results, at the end of the run, entered on table number 2. When mercury is added to the plates this is included in the "mercury used," though of course it may be kept separate if desired.

The mercury is squeezed from the amalgam removed from the plates and recorded under the column "mercury recovered." The column "net mercury used" is the difference between the two previous columns and its total at any time gives the sum of:—

(a) Amount of mercury in the batteries.

(b) Amount of mercury in plate amalgam.

(c) Amount of mercury lost.

After some experience on a certain class of ore the man who has been keeping such a record should be able to arrive at a fairly accurate estimate of the amount of gold in the batteries at any time during the run.

The samples of mill tailings should be taken automatically every ten or fifteen minutes during the entire run and separate samples taken for each shift.

(TABLE No 2)

NUMBER OF STAMPS	WEIGHT OF STAMPS	TONS PER 24 HRS. CAPACITY	DROP IN INCHES	NUMBER OF DROPS	HEIGHT OF DISCHARGE	KIND OF SCREEN	BATTERY: WET AMALGAM	BATTERY: WET RETORT	BATTERY: PER CENT GOLD	PLATES: WET AMALGAM	PLATES: NET RETORT	PLATES: PER CENT GOLD	GOLD IN TAILINGS	ASSAY OF TAILINGS	CHARGE TO BATTERIES	SMELTED GOLD: WEIGHT	SMELTED GOLD: LOSS IN SMELTING	SMELTED GOLD: VALUE PER OUNCE	SMELTED GOLD: TOTAL VALUE	VALUE PER TON OF ORE

Table No. 2

PROFITS ON LOW GRADE ORE—SOME INSTRUCTIVE FIGURES

For the first six months of the current year the gold mines of the Witwatersand have earned an aggregate profit of £4,700,000. Companies for which detailed returns are available have netted £4,659,000, and the Vogelstruis Estate and the Orion Mines, together with one or two small producers, may be calculated to bring the full total up to approximately £4,700,000. In 1906 a total of £8,220,000 was earned, and at the rate of earning for the first six months the 1907 total may be anticipated at £9,400,000. For the last four months working costs in respect of sixty-three companies have been under 22s. per ton, the expenditure per unit during June being 21s. 6d., and the profit being at the rate of 12s. 4d. per ton. Last year the cost of expenditure worked out at 22s. 5 1-2d. per ton, the profit being at the rate of 12s. 1d. per ton. A study of aggregate profits, together with costs and profits on a per ton milled basis, show that, whilst working costs have been reduced by about one shilling per ton during the past year, the revenue per ton has also fallen by practically the same amount. This is the common history of Witwatersrand mining, and in future this particular phase is likely to be brought into much greater prominence than hitherto. Each reduction in the cost of operation brings a certain number of tons into the zone of payability, and whilst the mines are to-day dealing with ore worth just under 34s. per ton, it is not unreasonable to think that before very long 30s. will be the value of a Rand ton. If the present rate of profit-earning is to be maintained, working costs, it will be seen, must be brought down to about 17s. 6d. The relation of the cost of operation to the productive value of the Rand is a fascinating but highly intricate problem. It is extremely difficult even to approximate the additional amount of pay ore which a reduction of, say, 4s. per ton in the cost of working means to the Rand, but it is certainly enormous. In the earlier days of the Rand small mills and more expensive stores necessitated the working of richer ore than heretofore, but the days of very high costs and 12 dwt. ore are over. An instructive view of Rand mining economics may be obtained by estimating the cost of wining a sovereign's worth of gold. To-day it is costing 12s. 9 1-2d.; just previous to the war it was about 12s. 6d. Despite the fact, then, that working costs per ton have been very appreciably reduced since the 1899 days, the expenses entailed in winning a sovereign's worth of gold are higher to-day than in the period preceding the war. The obvious deduction is that the grade of ore milled has decreased more than working costs.

Of the sixty-two companies which declared profits in June, just 50 per cent. earned less than 10s. per ton. The Robinson, which is an exceptional proposition, earned £65,050, or 40s. 2d. per ton. Important mines like the Witwatersrand, which made £14,752, the Rose Deep with £63,100, and the Geldenhuis Deep with £14,050, each earned less than 10s. per ton. These facts serve to emphasize the importance of fully realizing that the Rand is a low grade field, and that in the deeper level future companies earning profits at the rate of under half a sovereign per ton will account for the greater part of the Rand's earnings.—*Exchange.*

Abstract of Judge Longley's Decision in the Suit of the Dominion Steel vs. Dominion Coal.

The Dominion Coal Company was in default in its deliveries during the months of August, September and October, 1906.
